Artery.

Artery, in Anatomy, from aers, air, and repus, to keep, is the name by which those vessels are distinguished through which the blood flows from the heart to every part of the body. The term was first adopted by the anatomists of the Alexandrian school, in consequence of the erroneous opinion which they entertained, that these vessels were designed for the distribution of air throughout the body.

Arteries, Structure of. The larger arteries have thick and elastic sides, so that they remain open when divided, and present a regularly circular aperture. The sides may be separated into three strata of dissimilar substances, which are technically called coats. The innermost, which is generally termed the cuticular coat, is very thin, but very strong and indurated. Upon this circumstance depends the regularly circular form of an injected artery; for if the cuticular coat bulks from too great force being used in injecting, the exterior elastic coats are detached into an irregular and uncertain figure. The internal surface of this coat is perfectly smooth, so that the blood glides along it without impediment; the external surface is a little rough, and is connected by cellular substance to that coat which surrounds it. The middle or muscular coat consists of circular fibres which are scarcely visible in the largest arteries, but are very manifest and strong in the smaller ones; they are seen projecting in circular ridges, beneath the thin cuticular coat of a small artery, when it is slit open. The great increase of the muscular power of the small arteries is not only evident to the light, but has been demonstrated by experiment. Mr. Hunter bled a horse to death, and afterwards examined the state of the arteries. The aorta was contracted about a 34th part of its natural area, the iliac 34th, the radial 34. (See his Treatise on the Blood, Inflammation, &c.) The external or elastic coat of the artery appears to be made of condensed cellular substance; it is powerfully elastic, and abounds in the larger arteries, but gradually diminishes in quantity as the size of the vessel decreases; so that the small arteries are quite flaccid, and collapse when divided. It is easy to perceive the use of these various degrees of elasticity and muscular power, which are given to the different sorts of arteries. In the large arteries, muscular power seems unnecessary, for the force of the heart is sufficiently adequate to the propulsion of the blood; but in the smaller arteries, where the effect of the heart's action declines, a proportionate muscular power is allotted to the vessel to urge on the circulating fluids. The arteries have their nutrient arteries and veins, their absorbents, and their nerves. All the arteries proceed from one great vessel, as the branches spring from the trunk of the tree; and we proceed to notice certain circumstances observable in Arteries, Ramification of the. 1. When a large artery gives off a branch, the conjoined areas of the two vessels make a greater space for the blood to move in, than the area of the original vessel. The increase of dimensions in the branches of a large artery is slight, but in those of a small one it is so considerable, that Haller has estimated it as surpassing by 3d that of the trunk from which they sprung. The conjoined areas of all the small arteries greatly exceed that of the aorta, that the fame anatomist, in opposition to former opinions, says, these vessels may be considered as conical, the base of the cone being in the extreme arteries, and the apex in the heart.

2. When a large artery sends off a branch, its course does not, in general, deviate further from that of the trunk, than an angle of 45 degrees. Sometimes a branch, which has gone off at an acute angle, returns, and proceeds in a contrary direction to that of the trunk; and these arteries are generally
ARTERY.

generally called circulations. Sometimes, indeed, a large artery does proceed from the trunk at a greater angle, nearly a right angle, as the renal arteries. &c. Though the large arteries generally ramify at acute angles, there is great diversity in the branching of the smaller ones.

3. Arteries, in general, do not pursue a straight, but serpentine course; in some instances it is remarkably the case; as in the spermatics, those of the face and occupit, and in most of the smaller arteries.

4. Though the ramification of arteries may be compared to the branching of trees, yet it differs materially in this particular, that the different branches frequently conjoint. This conjunction is technically termed, if we borrow the phrase from the Greek language, their "Anastomosis," if from the Latin, their "Inofoulation." This union of arteries rarely happens among the larger ones, but frequently among the smaller, and increases in number in proportion to the minuteness of the vessels. The utility of the inofoulation of arteries is evident: were it not for this circumstance, if any arteries trunk were accidentally compressed, so that the current of blood in it should be for some time obstructed, the parts which it supplied must perish. But in consequence of the frequent communication of the arteries with one another, the blood can pass from the adjacent arteries into all the branches of any one accidentally obstructed.

When arteries inofoulate, two currents of blood, moving in opposite directions, must come together, and retard each other's motion. This probably is the reason that larger arteries, through which it seems necessary that the blood should flow with rapidity, so seldom conjoint, whilst the small arteries, in which it is requisite the blood should move tardily, communicate in surprising numbers, and with a frequency proportionate to their minuteness. The very frequent communication of the minute arteries, almost as effectually prevents the prejudicial consequences of obstruction in the larger trunks, as if those arteries themselves were made to communicate by more direct and larger channels. All these minute arterial tubes are capable of enlargement, and it is an ascertained fact, that even the aorta itself may be gradually obstructed, without the parts which it supplies being deprived of nourishment. From an attentive consideration of all these circumstances, it has been concluded, that the moderate inofole of the area of the branches of large arteries, the acute angles at which they divide, their nearly rectilinear course, and the rare occurrence of inofoulation between them, are designed to facilitate the rapid motion of the blood in them, so that it may arrive unchanged and in the same state that it was projected from the heart, at part of the body for the nourishment of which it is intended; whilst, on the contrary, the great inofole of the area of the smaller vessels, the variety of their angles, their tortuous course, and their frequent communications, were designed to check the velocity of the blood's motion, when it has arrived at that part where secretion is to be performed, and nutrition is to take place. Contrary opinions have indeed been maintained; and for the further discussion of this subject, we must refer the reader to the Circulation of the Blood.

Arteries, Termination of. When the arteries have become very minute, they terminate in two ways; they either turn back again and become veins, or turn the blood to the heart, or they send off fine vessels which abstract something from the circulating blood, and which are therefore called the fecerning arteries. Though none but minute arteries are ever reflected so as to become veins, yet many of them are of sufficient magnitude to allow the passage of common waxen injection. The arrangement of the minute vessels can be demonstrated by impelling common waxen injection into the arteries, particularly if a degree of putrefaction be suffered to take place previously to the experiment. In the direction of such a preparation, the continuity of the arteries and veins is very manifest. It seems therefore to follow from this facility of communication, that the mals of blood is constantly and freely circulating, in order to undergo that change which is effectcd in the lungs, whilst but a small part of it proceeds into the very minute arteries, for the purpose of having secretions made from it. For these arteries, however minute, must be considered large in comparison to the exility of others, which cannot be injected with wax, and even reject the red globules of the blood, or admit them in such small proportion, that they do not impart the red colour to the fluid which moves in those vessels. Now we may venture to assert, that these globules do not much exceed, in diameter, the 150,000th part of an inch, which circumstance sufficiently shews the minuteness of the latter arteries. See the article Blood. But however minute arteries may become, still they must all end in the same manner; they must be continued into veins, for that is the route which the blood, or subtle injections pursue, and from the molt minute arteries those which perform secretion arise.

The fecerning arteries are too minute to admit commonly of demonstration; they are however evident in some glands; in the kidney for instance, they may be seen continued into the excretory vesicles or tubuli uriniferi. Subtle injections, when thrown into the larger arterial trunks, may be seen oozing out on the surfaces of membranes, and into the cellular substance, and they are generally supposed to be poured forth from the open orifices of the fecerning arteries. Analogy therefore, rather than actual demonstration, leads us to believe, that the fecerning arteries absorb the particles of nutrition, or the materials which compose the fabric of the body, from the circulating fluids, and deposit them from their open mouths, so as by this means to build up and keep in repair the structure of the body.

Arteries, Distribution of. The great artery, whose branches supply the whole of the body, is named the "aorta." It comes off from the upper and back part of the left ventricle, where it is surrounded for a short part of its course by the fleshy fibres of the heart. Its origin appears externally to be divided into three distinct eminences, which denote the situation of its femurval valves.

The aorta emerges from the basins of the heart, between the pulmonary arteries and the right auricle. It ascends at first rather to the right, till it arrives at the upper edge of the second rib. Then it begins to bend backwards across the division of the pulmonary artery and of the trachea, till it reaches the left side of the spine, in which situation it descends from the fourth or fifth dorsal to the last lumbar vertebra.

By the "arch of the aorta," is meant that part of the vesicle which arises from the heart, and bends across the chest. It teds off the following branches: viz. the two coronary arteries, whose mouths are situated just above the upper edge of the femurval valves. They depart from the trunk at right angles, and are distributed to the heart itself. The most convex part of the arch teds off three large branches; first, the artery innominata; secondly, the left carotid artery; and thirdly, the left subclavian artery. Varieties not unfrequently occur in the number of arteries which arise from this upper part of the arch: a long lift for them may be seen in Smeunerring de corporis humani fabrica, tom. v. p. 420.

The right coronary paifes in the groove between the right auricle and ventricle, covered by fat, to the flat surface
ARTERY.

The labial artery, which is also called the facial, external maxillary, or angular artery, arises from the external carotid under the digastric and mylohyoid muscles; it advances in a tortuous manner to the base of the jaw, passing through a deep furrow which is made for it in the submaxillary gland; by a bold and sudden turn it bends over the inner border of the jaw at the anterior margin of the masticator muscles, and then follows a tortuous course over the check to the side of the mouth and nose, under the zygomatic muscles.

Before it passes over the jaw, it sends off the following branches. 1. The ascending palatine artery, goes under the mylohyoid muscles to the pharynx, Eustachian tube, soft palate, and uvula. 2. An artery to the back of the tongue and tonsils. 3. A number of small branches to the submaxillary gland, the neighbouring lymphatic glands, the skin, the membrane of the mouth, &c. 4. The submental comes off just before the artery makes its turn; it runs forward on the mylohyoidus muscle towards the chin; there it turns over the lymphatics of the jaw, and is distributed to the skin and muscles of the chin, communicating with the inferior labial artery.

When the artery has passed over the basis of the jaw, it sends off; 1. A branch to the surface of the malleus, which communicates with the malleolar branch of the facial nerve. 2. The inferior labial artery, which supplies the lower part of the lower lip, and communicates with the submental, and with the coronary artery of the lower lip. 3. The coronary artery of the lower lip, which pursues a winding course under the orbicularis oris, till it meets and inosculates with its fellow of the opposite side. It is sometimes produced by the inferior labial. 4. The coronary artery of the upper lip may from its superior magnitude be considered as the continuation of the trunk; it follows the edge of the upper lip, lying on the membrane of the mouth, and in the middle of the lip has a large and free communication with the opposite artery; it sends off a large branch to the side of the nose, and two smaller branches which run along the front of the septum nasi; these communicate on the ala nasi with the branches of the ophthalmic and infraorbital arteries. The branches which the labial sends off vary much in size and number; sometimes it terminates in producing the coronary of the lower lip (vide Halleri Icon. facie. ii. tab. arter. faciei); sometimes the nasal arteries are entirely given off from the ophthalmic; sometimes the nasal branches of the labial extend over the nose to the forehead; sometimes the branches of one side differ from those of the other.

The ascending pharyngeal artery of Haller (Halleri Icon. facie. ii. tab. arter. pharyng.), which is the smallest branch of the external carotid except the posterior auricular, either arises from the back of the carotid opposite the lingual, or from the point of bifurcation. Its course along the neck is straight; it is found in front of the rectus capitis major, and on the side of the pharynx, being absolutely hidden by the two carotids. Its posterior branches supply the vagus, and mylohyoid muscle; the termination of the trunk enters the skull at the foramen jugulare, and ramifications on the dura mater. The occipital artery is covered at its origin by the digastric muscle; it passes in front of the jugular vein, then gets between the mastoid process and the atlas, under the muscles of the neck. Arriving near the ligamentum nuchae, it penetrates the complexus muscle, and becomes cutaneous. It sends off branches to the muscles along which it lies, one of which is much larger.

B 2
than the rest, descends along the outer side of the complexus, and communicates with the transversalis colli. A branch of the occipital artery enters the skull at the foramen jugulare, and forms the dura mater of the cerebellum. The trunk of the occipital artery branches over the back of the scalp, being distributed to the occipital portion of the occipito-frontalis, and to the skin. Its branches communicate freely with those of the temporal artery.

The posterior artery of the ear, the smallest branch of the external carotid, is given off higher up than any of the above-mentioned branches. Indeed it does not arise until the trunk has entered the parotid gland. It follows the course of the digastric muscle, ascends behind the external car, and distributes its branches to the ear and scalp, communicating with the temporal and occipital arteries. It sends off the artery of the mastoid process, which enters the foramen of that name, supplies the internal ear.

The superficial temporal artery continues its course through the parotid gland; it mounts over the zygomatic arch, and distributes its widely spreading branches over the side of the head.

Branches of the Temporal Artery.

Branches to the parotid gland; one or two small twigs to the front of the ear, called the anterior auricular arteries; a branch to the articulation of the lower jaw; and one or two branches to the mastoid muscle. The transverse artery of the face is given off by the temporal, while it is passing through the parotid gland; it emerges from that gland in company with the parotid duct, crosses over the mastoid muscle, and advances to the corner of the mouth, communicating with all the arteries of the face. The middle temporal artery, which is to be distinguished from the superficial temporal on the one hand, and the deep-seated temporal on the other, runs under the temporal aponeurosis, and extends as far as the fronto-occipitalis muscle.

After the temporal artery has passed over the zygoma, it divides sooner or later into the anterior and posterior temporal branches; these communicate with each other; the anterior branch communicates also with the frontal and supra-orbital branches of the ophthalmic; the posterior branch communicates with the posterior auricular and occipital arteries.

The internal maxillary artery is much larger than the temporal, and should therefore, if size be adopted as the criterion, be considered as the continuation of the carotid. It passes forwards and downwards between the external pterygoid muscle and the jaw; then following a serpentine course, it arrives at the pharynx, where it terminates by dividing into three branches.

Branches of the Internal Maxillary Artery.

A small twig entering the tympanum by the fissura Glaseri; another entering the skull at the foramen ovale.

The pharyngeal or middle meningeal artery mounts straight upwards through the pharynx of the sphenoid bone, and is distributed widely over the dura mater; it causes the deep grooves which impress the inner surface of the parietal bone; it communicates with the posterior meningeal vessels, which come from the vertebral and occipital arteries, and with the anterior ones from the ophthalmic.

The inferior maxillary artery enters the canal of the lower jaw, in company with the nerve of the same name; it feeds branches to the teeth and to the substance of the jaws; arriving at the foramen mentale, it divides into two branches; one of these goes forwards to supply the incisor teeth; the other comes out at the foramen mentale, and inosculates with the artery of the lower lip.

The pterygoid branches are distributed to the pterygoid muscles.

The two deep temporal arteries are two in number, and ramify deeply in the temporal muscle.

The artery of the cheek (arteria buccalis) runs along the buccinator muscle, and communicates with the arteries of the face.

The alveolar artery, or artery of the upper jaw, bends round the tuber of the jaw, and advances towards the face. Its chief branch enters a canal in the upper jaw, and supplies the teeth.

The infra-orbital artery enters and pales through the infra-orbital canal of the superior maxillary bone, and comes out upon the face at the infra-orbital foramen. It is distributed chiefly to the muscles of the face, and communicates with the coronary artery of the upper lip, and its nasal branches; with the transverse artery of the face, and the artery of the cheek.

The superior or descending palatine artery is one of the three branches, into which the internal maxillary divides at the spheno-maxillary fissure; it pales through the pterygo-palatine canal, and comes out at the posterior palatine foramen. After sending a branch backwards to the soft palate, the artery comes forwards under the arch of the teeth. A small branch of it pales by the foramen incisivum into the nose.

The upper pharyngeal artery is sent to the upper and back part of the pharynx.

The nasal artery, which is the continuation of the trunk, goes through the spheno-palatine foramen to the back of the nostrils; there it gives small twigs to the ethmoid and sphenoid cells, and larger branches to the septum and floor of the nostrils and antrum maxillare.

The internal carotid artery pursues a serpentine course along the front of the body of the vertebrae, till it arrives at the entrance of the carotid canal. It is connected with the par vagum, and the great sympathetic nerve, and also with the rectus anterior muscle. It follows the course of the canal of the temporal bone, passing first directly upwards, then turning horizontally forwards, and then ascending again in a straight direction, and entering the cavernous sinus. While in this sinus, it pales from the back of the sphenoid bone to the anterior clynoid processes, where it suddenly doubles back upon itself, and branches out to the brain.

Branches of the Internal Carotid Artery.

While in the cavernous sinus, it feeds off the two arteries of the receptaculum, which are spread upon the surrounding parts of the dura mater.

Having risen to the anterior clynoid processes, it feeds off the ophthalmic artery, which enters the orbit with the optic nerve. The artery is situated at first on the outside of the nerve; entering the orbit, it crofes obliquely over the nerve, and arrives at the internal angle of the eye. It feeds off the following branches,—The lacrimal artery supplies the lacrimal gland, and sends forward two small branches to the tarsi of the upper and lower eye-lid. The posterior ethmoidal artery passes through the posterior orbital hole to the ethmoidal cells. The supra-orbital or superior muscular artery passes along the upper part of the orbit, supplies the levator palpebrae, the rectus superior, and rectus internus orbii, quits the orbit at the supracylindrical foramen, and communicates with the arteries of the scalp. The central artery of the retina plunges into the optic nerve, runs along its axis, and ramifies beautifully on the retina. One of its branches penetrates the vitreous humor, and is distributed to the crystalline lens. The ciliary arteries do not all come off from the trunk of the ophthalmic, but many are produced by
by its branches. They may be divided into three classes.—The posterior or short ciliary arteries surround the optic nerve; they divide into twenty or thirty branches, which perforate the fontanelle of the sclerotic, and are distributed to the choroid. The long ciliary arteries are two in number; they perforate the sclerotic at one third of the distance between the optic nerve and the cornea; arriving at the orbiculus ciliaris, they divide into two branches, which follow the outer circle of the iris, and communicating together, form the zona major of the iris; the branches of this form the zona minor on the inner circumference of the iris. The anterior ciliary arteries penetrate the front of the sclerotic, and contribute to the formation of the zones of the iris. These vessels in the fuctus produce the arteries of the mem-

brana pupillaris. The inferior muscular artery goes to the muscle which are found beneath the globe of the eye; viz. the obliques minor, the rectus inferior and externus. The anterior ethmoidal artery passes through the anterior orbital hole; and entering the skull, is distributed to the dura mater. The superior and inferior palpebral arteries are defined for the upper and lower eyelids. The trunk, ar-

riving at the inner angle of the eye, splits into two branches: the nasal branch crosses the lacrymal bag, descends along the ala nasi, and communicates with the labial artery. The frontal branch is distributed to the scalp, and communicates with the temporal.

After the carotid has arrived at the anterior clinoid pro-

cess, it sends off several small branches, some one of which
goes to the choroid plexus.

Then it sends off the communicating artery, which meet-

ing and anastomosing with a similar branch of the vertebral, contributes to form the celebrated circle of Willis.

The artery then divides into an interior and a posterior branch.

The anterior branch, or the artery of the corpus callo-
fum, comes forward in the division between the two anterior lobes of the brain. Here it approaches the artery of the opposite side, and has a short but large communication with it just above the junction of the optic nerves. This commu-
nication completes the circle of Willis in front. The re-
lip of the trunk passes first upwards, and then turns backward over the corpus callosum, and between the two hemispheres of the brain.

The posterior branch, or artery of the sphenoid Sylvii, runs
directly forwards, and enters the sphenoid Sylvii; its branches
turn to the middle part of the brain chiefly. O:

bservation. All the arteries of the brain and cerebellum ramify first upon the pia mater, and then enter the cortical sub-

stance of the brain. They do not follow the directions of the convolutions. They are composed of thinner coats than other arteries, whence the blood may be seen even through the coats of the larger arteries.

The subclavian artery ascends behind the head of the clavicle and the insertion of the sternocleidomastoid muscle, towards the scaleni muscles; it passes between the ante-

rior and middle scalenes, and then bends over the first rib into the axilla, where it takes the name of the axillary ar-

tery. The outer edge of the scalenus may be considered as the boundary between the subclavian and axillary portions of the vessel.

Branches of the Subclavian Artery.

The internal mammary artery comes off from the front of the subclavian; it passes behind the articulation of the sternum and clavicle, then goes along the middle of the cartilages of the ribs, and terminates on the muscles abdom-
inis by communicating with the epigastric, intercostal, and lumbar arteries. It sends an artery to the thymus; a small branch which accompanies the phrenic nerve; two arteries to the pericardium; and some small twigs to the anterior mediastinum, and back of the ilium. Other branches come off at the intervals between the cartilages of the ribs, communicate with the intercostal arteries, and then go out to the muscles on the outside of the chest.

The inferior thyroidal artery arises from the upper part of the trunk; where it is covered by the sternocleidomasto-
des; it divides almost immediately into four branches.

1. The proper thyroid branch bends in a tortuous manner under the carotid artery, till it arrives at the thyroid gland, to which it is distributed communicating with the superior thyroidal artery. This branch sends one or two small twigs down along the trachea. 2. The ascending thyroid branch is a small but constant artery, which passes upwards in front of the trachea, and is distributed to the trachea, and is distributed to the trachea.

3. The inferior thyroidal artery of the neck goes along the side of the neck, and is distributed to the trapezius and neighbouring muscles of the capula. 4. The tracheo-cervical artery of the neck (tracheal or caroticus superior) passes along the root of the neck towards the capula, giving off branches to the neighbouring muscles. The trunk passing through the notch in the superior costal of the scapula, takes the name of the supra-epicardial artery; it sends off many branches to the supra-spinatus muscles, then descends under the acromion to the lower part of the scapula, where it communicates very largely and freely with the infra-epi-

cardial artery.

Observation. Sometimes the tracheo-cervical artery of the shoulder is a branch of the superficial cervical artery. Some-
times it comes off as a distinct trunk from the axillary artery, and then the name of suprascapular is applied to the whole of it. In these cases the fourth branch of the thy-

roidal is small, and only reaches to the surface of the trapezii, deltoïd, &c.

The vertebral, which is an artery of great magnitude, arises from the upper part of the subclavian, behind the inferior cervical ganglion of the great sympathetic nerve; it ascends through the foramina of the transverse processes of the cervical vertebrae, entering at the sixth, fifth, or fourth vertebra. In passing from the second to the first vertebra, it makes a great turn; then it again bends back-

wards along that groove of the atlas which is defined to receive it. Entering the skull at the foramen magnum, it ascends along the biliary processes of the occiput, and un-
der the medulla oblongata to meet the artery of the oppo-
site side at an acute angle; by the union of the two trunks the basilar artery is formed. The vertebral artery, as it passes through the transverse processes, gives off some branches to the spinal canal. And while it is passing through the occipital hole, it sends off the posterior meningeal artery, which supplies the dura mater on the occiput, and extends as far as the sphenoid bone. The inferior artery of the cerebellum arises immediately before, or after the union of the vertebrals; it comes off near the origin of the par-
vagus, and having distributed several branches to the inferior surface of the cerebellum, terminates in the fourth ventricle.

The anterior and posterior spinal arteries are usually given off before the union of the vertebrals. They descend along the spine and the back part of the medulla spinalis, and keep up their size almost to the bottom of it by means of frequent communications with branches from without. The basilar artery passes along the middle of the tuberulum annulare to its anterior margin, giving to several branches to its inferior surface. Then it divides into four branches, two for each side of the brain. The superior artery of the cerebellum bends round the crura cerebri, and is distributed to the upper part of the cerebellum; it also gives branches to...
to the crura cerebri, thalami, tubercula quadrigemina, and pineal gland. The deep-seated artery of the brain is separated from the former branch by the nerve of the third pair. Ascending between the cerebellum and posterior lobe of the cerebrum, it tends off the communicating branch, which meeting and inosculating with a similar branch of the carotid, completes the circle of Willis. The rel on the artery is distributed to the back of the brain.

The superior intercostal artery goes off from the back of the subclavian, and descends over the heads of the first and second ribs. It gives small twigs to the celiacus; two branches to the spinal marrow; two others which penetrate to the muscles of the back; and two branches for the first and second intercostal spaces, which communicate with the inferior intercostal arteries. These four branches are usually given off before the subclavian passes between the scaleni; the two following arise while it is passing, or immediately after it has passed.

The deep-seated cervical artery goes under the muscles of the neck, almost touching the vertebræ. It is entirely distributed to the surrounding muscles, and reaches almost to the occiput.

The superficial cervical artery is hidden under the brachial nerves; its first branches go to these nerves, and to the scaleni muscles; the rel of the trunk goes to the muscles behind the neck, as the splenius, complexus, trapezius, and levator scapulae.

The artery, having left the scaleni muscles, recedes from the trunk of the body, and assumes the name of axillary; it bends obliquely downwards over the middle of the first and second ribs, and under the clavicle into the axilla. Emerging from under the clavicle, it is covered by the brachial nerves, by the axillary veins and glands; externally it is protected by the pectoral muscles. It is situated in the axilla, between the serratus anterior and subscapularis muscles; at the lower margin of the tendon of the latissimus dorsi, it changes its name for that of the humeral artery.

**Branches of the Arterial Artery.**

The first or upper thoracic artery arises near the upper margin of the pectoralis minor muscle, behind which it descends; its branches supply the serratus anterior, pectoral, and some of the intercostal muscles. The long or second thoracic artery, which is sometimes a branch of the posterior circumflex, or infra-scapular arteries, passes also behind the pectoralis minor, as far as the sixth rib. Its branches go to the axillary glands and mammae, also to the serratus, pectoralis minor, and intercostal muscles.

The two thoracic arteries inosculate with the intercostals, and the internal mammary.

The thoracic artery of the shoulder (arteria thoracica humeraria) comes off near the second rib, and penetrating between the pectoralis major and deltoid is distributed chiefly to the former muscle, and the neighbouring integuments.

The deep or fourth thoracic branch (arteria thoracica alaris) supplies the axillary glands, the pectoralis minor, and subscapularis.

Observation. The thoracic arteries are subject to considerable variety in number, size, and distribution. The infraScapular, or subscapular artery, which is a very large trunk, comes off near the neck of the scapula. Its first branches go to the subscapularis, to the capsule of the shoulder joint, and to the muscles, which arise from the coraco-shoulder process. A very large muscular branch is distributed to the teres major and minor, the serratus, latissimus dorsi, subscapularis, &c. The principal part of the trunk turns over the inferior costal of the scapula, and ramifies on the dorso of the bone, supplying the infra-spinatus, and teres minor, and communicating with the suprascapular artery.

The posterior circumflex artery goes off between the teres major and subscapularis; it passes backwards between the two, and under the long head of the triceps, and is reflected round the head of the humerus, being connected with the deltoid. Its branches go to the deltoid and other muscles about the scapula, and communicate with the profunda humeri.

The anterior circumflex artery is a much more slender branch; it goes under the biceps and coracohumeralis, and terminates on the deltoid.

The brachial or humeral artery leaving the axilla, pursues its course along the middle of the biceps muscle; it passes over the brachialis internus, and advances gradually towards the front of the arm. In this course the large median nerve lies in front of it. Arriving at the bend of the elbow, it goes under that production which the tendon of the biceps bends off to the falcia of the fore-arm, and is lodged deep in the hollow which is left between the two mafhes of muscles of the fore-arm, where it divides into the radial and ulnar arteries. The median nerve full remains in front of the artery; the cephalic vein is situated considerably on the outside of the artery; and the median vein crosses over it to join the cephalic.

**Branches of the Brachial Artery.**

Branches of this consequence go to the teres major, latissimus dorsi, triceps, coracohumeralis, biceps, and nerves of the arm.

The larger deep-seated artery of the shoulder (profunda humeri major or collateralis magna) arises high up in the arm, and is frequently given off by the inferior scapular, or posterior circumflex arteries. It bends backwards between the long and the external head of the triceps, giving many large branches to that muscle, and comes out at the back of the arm, where it divides into two branches; these communicate at the back of the elbow with the radial and ulnar recurrences.

The nutrient artery of the humerus comes off near the insertion of the coracohumeralis, and having distributed branches to the neighbouring muscles, enters the sub stance of the bone.

The smaller deep-seated branch, or branches, go to the outside of the brachialis internus, supinator radii longus, extensores carpi radiales, &c. and communicate with the recurrences of the fore-arm.

The great anastomosing branch (ramus anastomoticus magnus) comes off from the inside of the trunk, within a short distance of the joint, and proceeds towards the inner condyle; its branches communicate above with the profunda below with the recurrences.

The two last-mentioned branches, with one or two more which descend along the triceps to communicate with the arteries of the fore-arm, are sometimes described under the name of collaterales minors.

The radial artery, which is smaller than the ulnar, seems to be given off as a branch from the ulnar; it passes along the surface of the pronator teres, and then goes on the inside of the supinator longus to the ulna. It bends under the extensor tendons of the thumb, and penetrates the abductor indicis to arrive in the palm of the hand. Here it passes along the heads of the metacarpal bones, and having formed the arcus profundus vulv. communicates on the opposite side of the hand with a branch of the ulnar.

**Branches**
ARTERY.

Branches of the Radial Artery.

The recurrent branch of the radial artery is reflected towards the outer condyle, between the brachialis internus and the radial extensors of the carpus; there it has numerous communications with the collateral arteries of the arm.

The superficial arch of the palm of the hand is given off just as the trunk begins to turn over the radius; it goes over the abductor pollicis, or through its fibres, to communicate with the ulnar, and thereby complete the superficial arch. This branch varies much in size; sometimes it is very small, and does not reach to the ulnar artery; sometimes it is so large, as to give off the branch to the outside of the thumb; or even to both sides of the thumb.

At the back of the hand, the radial gives off an artery or two to the back of the thumb, another to the back of the fore-finger, and a third to the back of the carpus (dorsalis carpis), which communicates with the interossei, and sends small branches between the metacarpal bones.

After the radial artery has entered the palm of the hand, it sends off the great artery of the thumb, which runs along the side of the first phalanx of the thumb, and then divides into three branches. Two of these are for the two sides of the thumb, and the third for the radial side of the forefinger. The branches of the deep-intersosseus arch are small, and supply the interosseus muscles, and come out at the back of the wrist and hand.

The ulnar artery goes under the pronator teres, flexor carpi radialis, ulnaris, and palmaris longus, and paves within the edge of the flexor carpi ulnaris to the wrist. There it is situated just within the pisiform bone, bends across the palm of the hand, over the flexor tendons, so as to form the superficial arch of the palm of the hand, which is situated under the palma falcis, and opposite to the middle of the metacarpal bones. It terminates at the opposite side of the palm by communicating with the superficial branch of the radial artery.

Branches of the Ulnar Artery.

The recurrent branch of the ulnar goes under the flexor muscles to the back of the internal condyle, where it communicates freely with the collateral arteries of the arm.

The interosseous artery comes off very soon from the ulnar: it immediately sends a large branch through the interosseous ligament to the back of the fore-arm; this branch gives off the interosseous recurrent, and then paves down the fore-arm to the wrist, supplying the extensor muscles. The trunk of the interosseous artery descends along the ligament to the pronator quadratus; there it perforates the interosseous ligament, and communicates with the other branch of the interosseous artery and with the dorsal branches of the radial and ulnar arteries.

An artery to the back of the hand (dorsalis manus), communicates with the interosseous arteries.

The deep palmar branch goes off just below the pisiform bone; it dips under the flexor tendons, and communicating with the radial artery, completes the deep palmar arch.

The convex part of the superficial arch then produces three large digital arteries, which, passing between the metacarpal bones, and arriving at the root of the fingers, divide each into two branches, which go along the side of the fingers to their very apex, where they communicate.

Observation. The arteries of the fore-arm are subject to great variations. The brachial sometimes divides before it arrives at the elbow, even as high as the axilla, in some subjects. Then the course of these arteries is natural in other respects. Sometimes, however, where this high division takes place, the ulnar artery, instead of going under the muscles, which have been mentioned, goes over them and just under the skin. Sometimes the radial, ulnar, and interosseous arteries proceed straight into the palm of the hand, and are distributed to the fingers without forming any arches at all.

The aorta having formed its arch, paves gradually behind the lungs to the left side of the bodies of the vertebrae. It descends in a straight course along the back of the posterior mediastinum until it arrives at, and paves through, the crura of the diaphragm; this portion of the vessel is termed the thoracic aorta.

Branches of the Thoracic Aorta.

The common bronchial artery comes off high up from the front of the aorta; it divides into two branches, one for either lung.

The right and left bronchial arteries arise lower down: and often there is a fourth or inferior bronchial artery.

These arteries are defined for the nourishment of the substance of the lungs: they supply also the bronchial glands, and the roots of the great vessels, which come off from the heart. They are remarkable on account of their communications with the pulmonary artery.

The cephalic arteries are about five or fix in number: they run upon the surface of the cephalogloss, and communicate with the coronary artery of the stomach.

The lower intercostal arteries are nine or ten in number, according to the number of ribs, which are unfurnished by the intercostal branch of the subclavian artery. They arise from the back of the aorta, and follow the curve of the lower or grooved edge of the ribs. The upper ones are the smallest, and ascend somewhat; the lower ones are nearly transverse in their course. The arteries of the right side are longer, as they have to pass over the bodies of the vertebrae. They all give off: 1. a branch which enters into the spinal marrow as the nerves pass out; 2. a larger branch, which goes to the muscles at the back of the spine; 3. an upper branch which, coming off at the angle of the rib, goes along the upper edge of the rib below. The continuation of the trunk communicates with the mammary and thoracic arteries above: with the epigastric and lumbar arteries below.

The aorta, having passed through the crura of the diaphragm, takes the name of the abdominal aorta. It is still situated on the left side of the bodies of the vertebrae; it is separated from the vena cava by the left lobe of the liver and the crus of the diaphragm. It approaches gradually to the middle of the vertebræ, and gets in company with the vena cava, a little above the kidneys. At the left lumbar vertebræ, or at the interface between the fourth and fifth, it divides into the two common iliac arteries.

Branches of the Abdominal Aorta.

The right and left phrenic arteries are the first branches of the abdominal aorta: sometimes they arise from the celiac artery; sometimes a single trunk, either from the aorta or from the celiac, produces both the right and left phrenic arteries: they cross over the crura of the diaphragm, and then bend round the central tendon, sending off branches to the floor of the diaphragm in all directions: they give branches to the renal capsule and fat of the kidney.

The celiac is a large short trunk, coming off from the front of the aorta, while it is still between the crura of the diaphragm. It is surrounded by the jejicer arch of the stomach; beneath it are the pancreas, and on the left side the lobus Spigelii. After a course of few lines, it divides into three branches: the coronary artery of the stomach, the hepatic, and the splenic arteries.

The coronary artery of the stomach is the central branch of the celiac; it mounts upwards towards the cephalogloss, sends
sends a large branch to the great extremity of the stomach, and then returns along the lesser arch; its branches are distributed over both surfaces of the stomach, and communicates in the neighbourhood of the pylorus, with the superior pyloric branch of the hepatic; sometimes the coronary artery is much larger than usual; then its trunk passes from the aortic to the left lobe of the liver.

The hepatic or right branch of the celiac comes off behind the pyloric extremity of the stomach; it ascends towards the right, is contained in the left side of Glisson's capsule, and divides under the neck of the gall-bladder into the right and left hepatic arteries, which are distributed to the right and left lobes of the liver; where the coronary celiac artery is continued to the liver, the hepatic artery only supplies the right lobe. The hepatic artery gives off the following branches. 1. The duodenal-gastric artery, which passes beside the duodenum, gives branches to the pylorus (pylorica inferior), duodenum (duodenales superiores), and pancreas (pancreatica transversa): it is continued under the name of the right gastric, or gastro-epiploic artery, along the greater curvature of the stomach; it gives branch, to both surfaces of the stomach, and communicates by the termination of its trunk with the left gastric artery. 2. The superior pyloric artery is reflected towards the lesser arch of the stomach, and communicates with the coronary celiac. 3. The celiac divides generally a branch of the right hepatic, goes along the left side of the gall-bladder, which it supplies.

The splenic artery is the largest branch of the celiac, in the adult. It purifies a tortuous course along the upper edge of the pancreas, then divides into six or eight branches, which enter the notch of the spleen. As the splenic artery passes along the pancreas, it sends off many short branches to the substance of that gland; also the posterior gastric arteries to the back of the great extremity of the stomach. The artery sends off, after its division, the vasa brevia, which are three or four branches to the great extremity of the stomach, and the left gastro-epiploic artery, which runs along the greater curvature of the stomach, and communicates with the right artery of the same name.

Obervation. Both the gastro-epiploic arteries send many small branches to the omentum.

The superior mesenteric artery is the largest branch of the abdominal aorta, and arises a few lines below the celiac: here it is situated between the pancreas, and the left turn of the duodenum, to both of which it gives branches; then it descends over the duodenum, and is received between the first layer of the mesentery; it bends from the left side of the spine towards the right groin, making a large arch, convex towards the left. From the left or convex side of this arch, are sent off from twelve to twenty arteries, each of which soon after divides into two branches: these communicating with each other form arches, from the convexity of which other branches come off, which divide and recommunicate in a familiar manner. This is repeated a third, and when the branches are long, a fourth, and even a fifth time, until the left branches go straight to the intestines, divide and surround them. From the opposite or concave side of the artery are sent only two branches. 1. The middle colic artery passes along the mesocolon to supply the ascending and transverse parts of the colon; the left branch of this has a very large communication with the left colic artery; the right branch communicates with the ileocolic artery. 2. The ileocolic artery goes to the conjunction of the ileum with the cæcum. It sends an ascending branch to communicate with the middle colic artery; and a descending branch, which communicates with the termination of the superior mesenteric trunk.

The renal or emulent artery arises from the side of the aorta, between the superior and inferior mesenteric arteries. The left renal artery passes over the vein near the kidney; the right renal artery goes under the vena cava, and is covered by its corresponding vein. The artery divides into three or four branches, which enter at the notch of the kidney. The renal artery gives branches to the renal capsule, to the fat of the kidney, and ureter.

The spermatic artery is a long flender vessel, arising from the front of the aorta. On the left side it frequently comes from the renal artery; it pursues a tortuous course, and gets into company with its vein upon the psoas muscle. In men, it goes through the abdominal ring at the back of the chord, and supplies the testes. It sends off branches to the fat of the kidney, and to the ureter.

The spermatic artery of females supplies along the ligament of the uterus to the ovary. Its posterior branches supply the ovary; its anterior ones pass on with the Fallopian tube to the uterus, where it communicates with the uterine arteries.

The inferior mesenteric artery comes off low down from the left side of the aorta. It divides a little on the left side of the two bodies of the vertebrae, and sends off the left colic artery. This supplies the descending colon, and by communicating with the middle cceliac artery forms the famous mesenteric arch. The continuation of the trunk, under the name of the internal hemorrhoidal artery, goes along the back of the rectum; its branches reach almost to the extremity of that intestine, and communicate with the middle and external hemorrhoidal arteries.

As the arteries of the renal capsule vary much in size and number, they may be divided into three classes: the upper capillary arteries are branches of the phrenic; the middle ones generally arise from the side of the aorta, between the celiac and mesenteric arteries; the lower ones are from the renal arteries.

The adipous arteries are those which supply the renal fat; they arise above from the capillary arteries, below from the renal and spermatic arteries, and from the aorta.

The ureteric are also derived from various sources: the upper ones are from the renal and spermatic arteries; the middle from the aorta or common iliac artery; and the lower ones from one of the veical arteries.

The lumbar arteries are five in number, arising from the back of the aorta, at the intervals of the vertebrae, as the intercostal arteries do in the chett. They supply the muscles in the circumference of the body; they give branches to the spinal marrow, and others which penetrate to the muscles of the back; the left lumbar artery communicates with the ilolumbar artery.

The common iliac artery of the right side passes over the lower part of the vena cava; on the left side, it is situated exteriorly with respect to its vein; it passes obliquely downwards and outwards, and divides over the sacro-iliac symphyse into the internal iliac, or hypogastric, and the external iliac arteries.

The middle facral artery usually arises from the point of bifurcation of the aorta; it descends along the middle of the facrum to the coccyx, and communicates on both sides with the lateral facral arteries.

The internal iliac artery descends immediately into the pelvis. In the adult it is of the same size as the external artery, but in the fetus it is four or five times larger; and after having descended into the pelvis, becomes attached to the side of the bladder, and rises again to reach the umbilicus, under the name of the hypogastric artery. At this period, the arteries of the pelvis are small branches coming
coming from the lower or convex part of the hypogastric. Where the artery approaches the bladder in the adult, it is converted into a fibrous substancé, which still remains per-
vious to a certain extent.

Branches of the Internal Iliac Artery.

The iliolumbar artery ascends between the psoas major and iliacus internus, toward the crest of the ilium. Its branches are distributed to the neighbouring muscles, and communicate with the lateral iliac artery.

The lateral femoral arteries vary in number from one to three, four, or even five. They descend on the side of the facrum, communicate with the middle femoral artery, and send branches through the femoral holes to the cavity of the thigh.

The vertical arteries are three or four in number, arising from that part of the hypogastric which still remains per-
vious, as it approaches the bladder. One or more of these, which goes to the bottom of the bladder, and gives branches to the vesical, pudendal, &c. In men, to the rectum and vagina in women, is distinguished by the name of the lower vesical artery.

The middle hemorrhoidal artery comes off between the pudendal and gluteal branches, passes along the front of the rectum, and communicates with the external arteries. It sends branches to the bottom of the bladder, &c. in men; and a large one (which sometimes comes off differently from the internal iliac) to the vagina in women.

The uterine artery arises off the common iliac artery, as soon as it passes along the side of the uterus, on which it communicates with the spermatic artery.

The obturator artery, which frequently arises from the epigastric, passes along the side of the pelvis, at the upper edge of the obturator internus, accompanied by the nerve and vein of the same name, and goes through the psoas, which is left for it at the upper part of the thigh bone.

Having quitted the pelvis, it divides into an external and an internal branch, which are distributed to the obturator muscles, to the capsule of the hip, and to the origin of the tri-

ces. They communicate with the internal circumflex branch of the profundæ femoris.

The gluteal or posterior iliac artery is the largest branch of the internal iliac. It arises from the back part of the trunk, bends downwards and backwards, and quits the pelvis at the upper margin of the psoas muscle. It feeds a large branch between the gluteus maximus and medius. Another branch, more deeply seated, goes under the gluteus medius, and sends an artery close to the dorsal of the ilium at the origin of the gluteus minimus.

The ileal artery goes out of the pelvis at the lower margin of the psoas muscle, together with the great iliac nerve; it is here covered by the glutæus maximus, and descends towards the thigh: it sends off a coccygeal branch, which turns back between the sacro-iliac ligaments towards the coccyx. The other branches of this ar-
tery are distributed to the glutæus maximus, and other mus-
cles at the back of the thigh, and are remarkable on account of their numerous communications with the circumferential branches of the profundæ.

The pudendal artery goes out of the pelvis in company with the iliatic: it is smaller, and situated further from the facrum: it merely passes over the great iliac-iliac ligament, and enters the pelvis again at the smaller iliatic hole. Then it goes along the inside of the tuber-

ous and ramus of the ilium. It sometimes sends off small branches before it quits the pelvis to the rectum, pudendal, &c. While it is passing over the sacro-iliac ligament, and the tuberousity of the ilium, it gives off branches

which communicate with the circumflex arteries; also the external hemorrhoidal arteries to the fat of the perineum, sphincter ani, &c. which communicate with the middle and in-
ternal hemorrhoidal arteries. At the ramus of the ilium the artery divides into two. The perineal artery, which ascends between the accelerator muscle and erector muscles, and supplies the muscles, skin, and fat of the perineum. The artery of the penis, which is the continuation of the trunk. At the symphysis of the pubis it divides into two. The dorsal artery of the penis, which runs along the back of that organ as far as the glans, the root of which it encircles. The deep-seated artery of the penis, which enters the corpus cavernosum of its own side, into the cells of which it opens, and gives branches to the fatty sub stance of the urethra. The vesical, which is analogous to the artery of the penis of males, is termed the chordee in females. Its distribution to the clitoris is the same as that of the above-mentioned ar-
tery to the penis.

Branch of the External Iliac Artery.

The epigastric artery arises from the inner side of the trunk, near Poupart's ligament: frequently indeed its origin is absolutely below the ligament. It is reflected upwards and downwards behind the spermatic chord, and enters the upper part of the abdominal ring, it gets behind the rectus muscle, and ascends to the navel. The epigastric artery generally feeds a pretty large branch down the spermatic chord, which communicates with the spermatic artery. The other branches of this artery are merely muscular ones: the trunk communicates at the upper part of the rectus abdomi-

nus with the internal mammary artery.

The circumflex artery of the ilium arises opposite to the epigastric: it turns back, and runs along the crista ili, be-
tween the attachments of the obturator internus and trans-
versus abdominis muscles, as far as the back of the bone, where it communicates with the iliacus and iliolumbar arter-
es. Its branches are distributed to the neighbouring muscles.

The femoral artery is surrounded below Poupart's ligament by the inguinal glands, and much fat. After a course of about an inch and a half or two inches, it divides into two branches of nearly equal magnitude. The branch which continues in the direction of the trunk retains the name of the femoral artery; while the other, which descends among the muscles of the thigh, is named the deep-seated artery of the thigh (arteria profunda femoris). The common trunk sends off some trivial branches to the integuments, lymphatic glands, and neighbouring muscles: two or three larger branches supply the skin and fat of the pudenda.

The profunda comes off from the back of the femoral artery: it passes backwards, and descends for a short space, then gets between the heads of the testaceus muscle, and sends its branches through that muscle.

Branches of the Profunda.

The external circumflex artery, which is the first branch of the profunda, goes under the factorius and rectus mus-

cles,
cles, towards the root of the great trochanter. It sends off in its course numerous branches to the muscles along which it passes. Some of its branches communicate with the internal circumflex and perforating arteries at the back of the thigh. A large branch descends along the inside of the vastus internus to the knee, and communicates with the superior articular, and with the great anastomotic branches.

The internal circumflex artery comes from the opposite part of the trunk. It goes backward to the trochanter minor, and turning round the bone, appears between the quadratus femoris and triceps musculi. Its branches are distributed to the muscles on all sides; they communicate with the obturator, lischatic, and gluteal arteries.

The two perforating branches of the profunda (the femoral is the continuation of the trunk) pierce the triceps musculi, to which they give branches, and are distributed to the flexors of the leg. They communicate above with the circumflex arteries, and below with the articular arteries. The inferior perforating branch gives off the great nutrient artery of the thigh-bone.

The femoral artery passes from the front of the thigh gradually towards the inside. It is at first covered by the lymphatic glands, then it goes under the vastus musculi, and arrives at the tendon of the triceps, through which it penetrates into the ham, and takes the name of the popliteal artery. During this course, the femoral artery sends off small branches to the glands, to the vastus, rectus, and other muscles. The great anastomosing branch comes off as the trunk enters the tendon of the triceps musculi; it plunges into the substance of the vastus internus, from which it emerges at the knee to communicate with the articular arteries, and also with the descending branch of the external circumflex. Two branches go through the tendon of the triceps to the muscles at the back of the thigh; they are called by Murray the superior and inferior perforating branches of the femoral. They communicate with the perforating branches of the profunda.

The popliteal artery passes from the tendon of the triceps through the middle of that space which is termed the ham, and arrives at the upper extremity of the small muscle, where it divides into the anterior and posterior tibial arteries.

In this course it lies between the flexor muscles, and almost close to the bone. It descends between the tendons and the heads of the gastrocnemius, in contact with the capsule of the knee. It gives off small muscular branches to the flexor muscles, and other larger ones to the gastrocnemius and soleus. The articular branches of the popliteal are five in number: three of them come off above the joint, and are therefore called the superior articular arteries, the middle of these three is distributed to the back of the capsule; the other two bend round the femur just above the external and internal condyles. The inferior articular arteries are two in number, one for the above, the other for the outside of the joint. The four last-mentioned branches arise in front of the knee, where they form a vascular net-work by their numerous communications with each other, and with the recurrent branch of the anterior tibial, the australic branch of the femoral, and the descending branch of the external circumflex.

The anterior tibial artery comes off at the lower margin of the popliteus muscle, and immediately penetrates the interosseous ligament. It descends in the front of this ligament between the tibialis anterior and the extensor pollicis longus, becoming more and more superficial as it approaches the ankle. It pales under the transverse ligament of the ankle in company with the extensor tendons, then goes between the extensor pollicis longus and the extensor digitorum pedis longus to the root of the first metatarsal bone, where it plunges into the sole of the foot, and terminates by a large communication with the external plantar artery.

Branches of the Anterior Tibial Artery.

The recurrent branch is given off immediately after the trunk has passed through the interosseous ligament. It goes through the tibialis anterior muscle to the front of the knees, where it communicates with the articular arteries.

Small muscular branches arise throughout the whole course of the artery along the leg.

The external and internal plantar arteries supply the ankle joint and neighbouring part of the tarsus. The external plantar artery communicates with both the anterior and posterior branches of the peroneal artery. The tarsal artery goes under the extensor digitorum brevis along the second phalanx of the tarsal bones. It gives small branches to the ankle-joint, exten for brevis, &c. It also sends off three arteries, which run along the intervals of the metatarsal bones to the roots of the toes, where they join the digital arteries at the point of bifurcation.

The metatarsal artery runs along the heads of the metatarsal bones, and varies in size according to the magnitude of the tarsal artery. Sometimes it is large, and produces all the branches which have been described as coming from the tarsal artery.

The artery of the back of the great toe comes off just before the anterior tibial descends into the sole of the foot; it runs between the first and second metatarsal bones, and is distributed to the back of the great toe and of the second toe.

The posterior tibial artery is situated under the flexor muscle, and between the flexor communis digitorum and the tibialis posterior. It descends to the lower extremity of the tibia in this situation; then becoming more superficial, it bends behind the inner ankle, and enters the sole of the foot between the abductor pollicis longus and the concave surface of the os calcis; here it divides into the external and internal plantar arteries.

Branches of the Posterior Tibial Artery.

Large muscular branches to the tibias.

The nutritional artery of the tibia.

The peroneal or fibular artery, which varies much in size, descends between the tibialis posterior and flexor longus pollicis, giving branches to those muscles in its passage to the bottom of the leg, where it divides into an anterior and a posterior branch. The posterior branch descends in the direction of the trunk to the outside of the os calcis, where it communicates with the external plantar and external plantar arteries. The anterior branch comes through the lower part of the interosseous ligament, and advancing to the ankle, communicates with the external plantar artery.

Branches throughout the course of this artery to the neighbouring muscles.

Two large branches to the bottom of the os calcis.

The external plantar artery is the largest branch of the posterior tibial; it runs along the inside of the abductor minimi digit. till it reaches the fifth metatarsal bone; there it bends inwards to the first metatarsal bone, where it insinuates with the tibialis antica, and forms the plantar arch. This artery sends off many branches to the adjacent muscles, and to the bones of the tarsus. The convexity of the arch gives off four arteries, which pass between the metatarsal bones to the roots of the toes, where each of them divides into two; these are distributed along the sides of the toes. The arch also sends off three or four branches, which penetrate to the back of the foot.

The internal plantar artery keeps along the inside of the foot in the direction of the abductor pollicis; it terminates by
ART

by communicating with those branches of the external planter which supply the great toe.

ARTERY, wounded. See ANEURISM.

ARTH, in Geography, a river of South Wales, which runs into the sea about ten miles south of Aberystwith in Cardiganshire.

ARTHEDON, in Ancient Geography, an island of Asia Minor, upon the borders of the Troade. Pliny.

ARTHEDON, in Ancient Geography, an island of Asia Minor, upon the borders of the Troade. Pliny.

ARTHEDON, in Ancient Geography, an island of Asia Minor, upon the borders of the Troade. Pliny.

ARTHETEL, something cast into a court, in Wales, or its marches: whereby the court is letted or discontinued for the time. The calling of artel is prohibited by 26 Hen. VIII. cap. 6.

Artel is a British word, more correctly written Ardeleaw, or Arدلhil, and signifies to sweat; as if a man were taken with stolen goods in his hand, he was to be allowed a lawful artel, or voucher, to clear him of the felony. This was part of the law of Howell Dha, according to whose laws, every tenant, holding of any other than the prince, or the lord of the fee, paid a fine "pro defensione regis," which was called arsin ardel.

ARTHEMIS, in Zoology, a genus of worms in the Malacca tribe established by Polis in his work on the shells of the two Sicilies. See VERMES.

ARTHES, in Geography, a town of France in the department of the Lower Pyrenees, and chief place of a canton in the district of Orthes, five leagues north-west of Pam. The place contains 2078 acres and the canton 10,278 inhabitants: the territory includes 105 square miles and 21 villages.

ARTHTRICARIA, in the Materia Medica, medicines suited to cure the diseases of the joints, particularly the gout; but the term is so vague and so indeterminate a meaning as to be altogether improper.

ARTHritis, formed from ἄρθρον, articulus, joint, in Medicine, a disease better known under the name of the COUT.

ARTHROCAENAC, in Surgery, a disease of the joints, or the extremities of bones, more commonly named SPINA VENTOSA, which fee. When this disorder affects children, it is called PODEARTHROCAENAC. We do not recollect any author to have distinctly treated of this complaint before Razes the Arabian physician, who has entered at large into the consideration of diseased joints.

ARTHRODIA, formed from ἄρθρον, articulus, and διάγεις, recipi, I receive, in Anatomy, a species of articulation, admitting of a very small degree of motion; as each bone composing the joint must have nearly a plain surface. Such is the articulation of the humerus with the scapula. See Anatomy.

ARTHRODYNA, in Surgery, a chronic rheumatic affection of the joints. This name was first imposed by Dr. Cullen, in his Synopsis Nafologic Methodicae. See RHEUMATISM and WHITE SWELLING.

ARTHRODUOSIS, is a suppuration of the joint, or at least a strong tendency to form pus. In this case there is a deep-seated inflammation, obstinately painful, sometimes throbbing, and accompanied with febrile symptoms. The treatment is described under the articles, ABSCESS, SPINA VENTOSA, WHITE SWELLING, INFAMMATION, and RHEUMATISM.

ARTHROPSIS, formed from ἄρθρον, articulus, in Anatomy, a juncture of two bones designed for motion; called also articulation.

ARTHUR, in Biography and History, the most remarkable name among the Britons. As a hero and a consummate warrior, he appears illustrious in our history; but as a being of romance, his splendour has dazzled the world. It has been generally inferred that the great achievements of the hero created those illusory actions and scenes depicted in the Mabinogion, or Juvenile Tales; and some authors, with such phantoms playing before their eyes, have denied existence to such a person altogether. But that there was a prince of this name, who often led the Britons successfully to battle against the Saxons, in the commencement of the sixth century, there can be little doubt; for he is mentioned by contemporary writers, whose works are still extant; namely, Llywarch, Merin, and Talhelin; and he is likewise often recorded in the Triads, which are documents worthy of credit; but neither by these poets, nor in the Triads, is he in any respect exalted to that rank in which the world now beholds his name, or extolled above other princes who held similar stations in the country.

About the year 516, or 517, Arthur was elected by the states of Britain to exercise sovereign authority, as other princes had been chosen, in dangerous times; and he obtained that pre-eminence in consequence of his superior abilities and bravery, being until that time only a chieftain of the Silurian Britons. He continued to prevent a successful opposition to the increasing power of the Saxons, until a fatal diffusion broke out between him and Medrod; a radical evil among the Britons, in consequence of their being divided into many small states; and which, about the year 540, kindled into a civil war; and Medrod joined his power with the Saxons, which ultimately produced the battle of Camelon, equally fatal to the leaders on both sides, and which brought dilatious ruin on the Britons.

Such was the career of Arthur, as exhibited by the bards and the Triads. The hero under the same name in the dramatic tales called Mabinogion, is totally of different features, and in fact is a distinct personage altogether. The hero is then a mythological character of times so remote as to be far beyond the scope of history; his attributes in the dramatic tales before mentioned point him out as such. Memorials of this being, and of several others connected with him, have been traditionally preserved in various and very distant parts of the world; and if we mistake not, their memorials are written in the heavens, and some of the constellations bear their names. Arthur is the Great Bear, as the epithet literally implies: and perhaps this constellation being situated so near the north pole, and visibly describing a circle in a small space of the heavens, in the true origin of the famous round table.

By confounding the Arthur of history with that of mythology, the chroniclers of the middle ages have committed a monstrous anachronism; and thus have blended the real facts of the former with the allegorical attributes of the other; and this confusion is still increased by all the succeeding writers of romance.

There are some very extraordinary things related concerning the mythological Arthur, in the Mabinogion, and particularly in the story of the pursuit of Olwen; therein we recognize the Indian Men, exactly by name, and with similar attributes, acting as one of the agents of Arthur to recover Olwen, the representative of the fecundity of nature. To the above rational and credible account, for which the editor is indebted to an ingenious writer, it may not be improper to subjoin, for the gratification of the curious reader, some other particulars, transmitted by Geoffrey of Monmouth, and other historians, of more doubtful authenticity.

From them we learn, that Arthur was the son of Uther, the pendragon and dictator of the Britons, by an adulterous connection with Igrina, wife of Gorlois, Duke of Cornwall, favoured by the aid of Merlin's magical skill. Upon the death of Uther, in 516, Arthur, at the age of 15, or according
According to Buchanan, 18 years ascended the throne. With a competent army, which his extraordinary fame enabled him speedily to raise, he routed Colgrin, the Saxon duke, and all his forces, confining of Saxons, Scots, and Picts, who were committing horrid devastations in Britain. Having purged him to York, he was obliged, in consequence of the succour afforded to Colgrin by Cordic, king of the Saxons, to raise the siege and to march to London. Affiliated by a supply of troops, furnished by his nephew, Hoei, king of Armorica or Brittany, he marched to Lincoln, which was besieged by the Saxons, whom he defeated; and he then compelled the survivors to surrender, on condition of being allowed to leave the kingdom. These men, after having embarked, repented, and relented on the western coast; and proceeding to lay siege to Badon, or Bath, Arthur was obliged to decline his intended pursuit of the Scots and Picts, and to make forced marches for the relief of the city. After a very obstinate and severe engagement which lasted two days, Arthur, having performed extraordinary feats of valour, took their camp, and slew Colgrin, and another of the principal leaders. He then hastily returned to relieve his nephew Hoei, who was invested by the Scots and Picts at Dumfriestone in Scotland. Having succeeded in this enterprise, he directed his course to York, where he is said to have established the Christian worship on the ruins of the Pagan, and to have married a lady called Guanhumara, who, under the name of Guenever, became the subject of various metrical romances. Fabulous hitherto reports, that he invaded and subdued Ireland, Iceland, Gotland, and the Orkneys; and having finished these exploits, governed his kingdom for 12 years with undisputed tranquillity, and very extraordinary splendour. At this time he instituted his famous order of knights of the round table. Having also, as fable relates, conquered Norway and Denmark, invaded France, and taken Paris, and in nine years made himself master of the whole kingdom, the provinces of which he distributed among his domelities, he returned, and held a grand assembly of his tributary kings and nobles at Caerleon in Monmouthshire, where he was solemnly crowned. Whilst he was afterwards purifying his conquests, and marching for Rome, his nephew, Modred, who in his absence had prevailed on his queen, Guanhumara, to marry him, set up the standard of revolt, and called in to his assistance the Saxons and other barzabans. Arthur hastily returned, and three battles were fought between him and Modred; in the last of which, Arthur was mortally wounded, received so many wounds, that, retiring to the Isle of Avalon, he died, 42 Edw. 3. 4, and was buried in that place. "Every nation," says Gibbon (Hist. vol. vi. p. 392), "embraced and adorned the popular romance of Arthur and the knights of the round table; their names were celebrated in Greece and Italy."—At length the light of science and reason was rekindled; the talisman was broken; the visionary fabric melted into air; and by a natural, though unjust revile of the public opinion, the severity of the present age is inclined to question the existence of Arthur." Mr. Whittaker (Hist. Manchester, vol. ii. p. 31 71.) has framed an interesting, and even probable narrative of the wars of Arthur; though it is impossible to allow the reality of the round table, or the Arthurian romance, and to have fought under the auspices of Ambrosius, the Pendragon, who sent him to the relief of the northern Britons, oppressed by the Saxons. After great successes in these parts, he fought his twelfth battle in the south of England, after he was elected to the pen- dragonship, against Cordic the Saxon. Mr. W. believes in the reality of his institution of a military order, the origin of all others of a like kind on the continent of Europe. He speaks in high terms of the glory of his reign, at length fatally terminated by the civil wars, which put an end to the hero's life. Bing. Brit.

Arthur Kull, of Newark Bay, in Geography, lies on the coast of New Jersey, in America, and is formed by the union of Passaic and Hackinack rivers.

ARTIACA, in Ancient Geography, a town of Gaul, in the road from Milan to Gerolasmann, by the Cottian Alps.

ARTICENA, a country of Alba, which made part of the kingdom of Parthia. Ptolemy.

Artichokes, in Botany. See Cynara.

Artichokes, Jerusalem. See Helianthus.

Article, Article, a little part or division of a book, writing, or the like.

Article is also applied to the several clauses or conditions of a contract, treaty of peace, or the like.

In this sense we say, articles of marriage, articles of capitulation, preliminary articles, &c.

Articles of the clergy, Articles clerici, are certain statutes touching persons and cauces ecclesiastical, made under Edward II. and III.

The statute made in the reign of Edw. II. 42 Edw. 3. 34, was made for terminating the disputes between the temporal and spiritual courts, about the limits of their respective jurisdiction. As this statute was procured by the clergy at a time when their alliance was much needed, it was very favourable to their shameful and exorbitant claims of exemption from civil authority. By the last chapter it is granted, that when clergymen confine before temporal judges their heinous offences, as theft, robbery, and murder, they cannot be judged or condemned by those temporal judges upon their own confession, without violating the privilege of the church; and that the privilege of the church being demanded in due form by the ordinary shall not be denied. This statute was actually plighted, and admitted in favour of a bishop of Hereford, A.D. 1324, under accusation of high treason. The statute de clero, 25 Edw. III. ii. 3 c. 4, provided, that clerks convicted for treasons or felonies touching other persons than the king himself, or his royal majesty, should have the privilege of holy church.

The article of faith is by some defined a point of Christian doctrine, which we are obliged to believe, as having been revealed by God himself, and allowed and established as such by the church.

The thirty-nine articles of the church of England were founded, for the most part, upon a body of articles compiled and published in the reign of Edward VI.

The articles of king Edward were 42 in number, and framed by archbishop Cranmer and bishop Ridley; and after having been submitted to the correction and amendment of the other bishops and learned divines, they were reviewed by the archbishop, and then presented to the council, where they received the royal sanction. These articles, though not brought into parliament, nor agreed upon in convocation, as the title seems to express, and as they ought to have been, were announced as "Articles agreed upon by the bishops, and other learned men in the convocation held at London in the year 1532, for the avoiding diversity of opinions, and establishing one true religion." In the reign of queen Elizabeth, they were reviewed by the convocation, and the 42 articles were reduced to the present 39; the following articles were omitted: viz. Art. 39: "The resurrection of the dead is not passed already." Art. 40: "The souls of men deceived do neither perish with their bodies, nor sleep idly." Art. 41: "Of the Miller-
ART

Millenarians." Art. 42. "All men not to be faved at last." Some of the other articles underwent a new division, two being joined into one, and in other parts one is divided into two; but without any remarkable variation of doctrine. It has been a subject of dispute, whether the first clause of the 20th article, viz., "The church has, and ever has, a rule of faith, and authority in controversies of faith," was a part of the article which paffed the synod, and was afterwards confirmed by parliament in 1571. It is certain it did not make a part of king Edward's articles, nor is it in the original MS. of the articles subscribed by both houses of convocation with their own hands, and prefered in Bonnet college library. The dispute, however, is of little consequence to the present subfebrigers, as this clause made a part of the article confirmed by parliament in 1572. These articles, having paffed the convocation, Jan. 31, 1562, were subfcribed immediately by molt of the members of both houses of convocation; but they did not pafs into a law, and become a part of the eftabliments, till nine years after this time. In the year 1571, an act was paffed confirming all the doftinial articles agreed upon in the synod of 1562; and enjoining fubfebrition on all perfons ordained to be deacons or priests, and on all who held any ecleflial livings, as well as licenced lecfters and curates.

23 Eliz. c. 12. It has been faid (Neal's His. Puritans, vol. i. p. 179, 4to.), that this act eftablished only the doctrinal articles; ftoffe, as they are expreffed, "which only concern the confeflion of the true faith, and the doctrine of the sacraments;" and, therefore, that the articles of the church, which relate to its discipline, were not designed to be the terms of minifterial conformity. These articles were ratified by parliament at the reformation of Charles II., in 1662; and fubfebrition to them enjoined on the heads of colleges, chancellorls, officials, and commiffaries, and also on schoolmasters, 13 and 14 Car. II. c. 4.

By 1 W. & M. 1. c. 18, commonly called the toleration act, diftinguifhing teachers are to fubfecribe all these articles except the 34th, 35th, and 36th, and part of the 20th; and in the cafe of anabaptifts, except also part of the 27th; or, if they crimpele fubfebring the fame, they fhall make and fubfecribe the declaration prefcribed by lat. 19 Geo. III. c. 44, profefling themselves to be Christianfs and profontants, and that they believe the Scriptures to contain the revealed will of God, and to be the rule of doctrine and practice; otherwife they are exempted from the benefits of the act of toleration. Diftinguifhing schoolmasters are executed from fubfebrition to the articles by the fame act. See Toleration.

Concerning these articles, very different opinions have been entertained by thofe who fubfecribe them; and they have also differed in their lemtiments and views with regard to the nature and extent of fubfebrition. Some have interpreted them more laxly, and others more rigidly; and they have not been agreed as to the limits or latitude with which they may be fubfebrifed. For the reafons that have been urged in favour of fubfebrition, and against it, and the manner in which it has been interpreted and understood, fee Subscription.

Articles, Lambeth, were nine articles on the subject of predileftation, perseverance, and the limitation of saving graces, drawn up by archbishop Whitgift and other learned divines, subfcribed by them, and enjoined on the students of the university of Cambridge, in confequence of a complait occafioned by a debate in that university, which commenced with a lelfon of Mr. Farret, who attacked the believers of predileftation with great fervor. The prime, in his letter to the university, represents them not as new decrees, but as an explication of certain points, cor responding to the doctrine profefled by the church of England, and already established by the laws of the land." But as they had not the queen's favon, who, however, is said to have been fully perfuaded of their truth, he defired that they might not become a "public act," but used pri vately and with difcretion.

Articles, Statute of the 55. or bloody statute, was an act for abolifhing diversity of opinion in certain articles concerning the Christian religion; 31 Hen. VIII. c. 14. By this law, the doctrine of the real presence, the communion in one kind, the perpetual obligation of vows of fidelity, the utility of private mats, the eceliacy of the clergy, and the necessity of auricular confeflion, were eftablimed. The denial of the fift article subjefted the perfon to death by fire, and to the fame forfeitures as in cases of treason; and admitted not the privilege of obferving; a severity unknown to the in quifition itself. The denial of any other of the five articles, even though recomned, was punifhible by the forfeitures of goods and chattels, and imepinment during the king's pleaure; an otllinate adherence to error, or a relapse, was judged to be felony, and punifhable with death. The mon tage of priests was subjefted to the fame punishment; their commerce with women was, on the firit offence, forfeiture and impenfion, on the second, death. The abjuring from confeflion, and from receiving the eucharift at the accustomed times, subjefled the perfon to fine and impenfion during the king's pleaure; and if the criminal per fifted after conviction, he was punifhed by death and forfeitures, as in cafes of felony. The rigour of these articles was somewhat abated by the 35th Hen. VIII. c. 5, in confequence of the interference of Cranmer. By this statute persons were not to be convicted but upon the oaths of two men; the prosecution was required to be within a year; and a perfon who pleaded against them, was to be informed within 40 days. Nevertheless several were burnt at this time for denying the doctrine of transubftantiation. Upon the acefion of Edw. VI. the statute of the five articles was repealed.

Articles of War, in Military Language, denote certain regulations for the better government of the army in the kingdoms of Great Britain and Ireland, dominions beyond the seas, and foreign parts dependent upon Great Britain. These may be altered and enlarged at the king's pleaure. In certain cafes they extend to thofe that are not military per fons; as when, by proclamation, any place is put under martial law, or when people follow any camp or army for the fale of merchandise, or fea in any menial capacity. It is ordained, that the articles of war fhall be read in the circle of each regiment belonging to the British army every month, or more frequently if the commanding officer thinks proper. A recruit or foldier is not liable to be tried by a military tribunal, unless it can be proved that the articles of war have been duly read to him.

Articles of the Navy, are certain expré rules and orders directing the method of ordering feamen in the royal fleet, and keeping up a regular discipline; first enacted by the authority of parliament soon after the reformation, lat. 13 Car. II. fl. i. c. 9, but since nevew modelled and altered by lat. 32 Geo. II. c. 23, amended by 19 Geo. III. c. 17. In these articles of the navy almost every possible offence is fet down, and the punishment thereof annexed; in which respect the feamen have much the advantage over their brethren in the land service; whole articles of war are not enacted by parliament, but framed from time to time at the pleasure of the crown. Judge Blackstone fuggests, that this distinction proceeded from the perpetual establishment.
of the navy, which rendered a permanent law for their regulation expedient, and the temporary duration of the army, which inhibited only from year to year, and might therefore with less danger be subjected to discretionary government. He adds, "whatever was apprehended at the formation of the Mutiny Act, the regular renewal of our standing force at the entrance of every year, has made this distinction idle. For if from experience we may judge of future events, the army is now lugubriously engraved into the British Constitution, with this singularly fortunate circumstance, that any branch of the legislature may annually put an end to its legal existence, by refusing to concur in its continuance."

Dr. Comm. vol. i. p. 329.

Articles, Lords of, in Scots History, a committee of ancient institution in the Scottish parliament, existing as far back as records enable us to trace the constitution of parliaments in Scotland. It was their business to prepare, and to diggel all matters which were to be laid before the parliament; every motion for a new law was first made there, and approved or rejected by them at pleasure; what they approved of was formed into a bill, and presented to parliament; what they rejected could not be introduced into the house. The lords of articles, then, not only directed the whole proceedings of parliament, but policed a negative before debate. The committee was chosen and constituted in such a manner as put this valuable privilege entirely in the king's hands. It is extremely probable, that the king once had the sole right of nominating the lords of articles. They were afterwards elected by the parliament, and confided of an equal number out of each estate; and most commonly of 8 temporal and 8 spiritual lords, of 8 representatives of boroughs, and of the 8 great officers of the crown. Capable either of influencing their election, or of gaining them when elected, the king commonly found them no less obsequious to his will, than his own privy council; and by means of his authority with them, he could put a negative upon his parliament before debate as well as after it.

James VI. in order the more effectually to preserve his influence over the lords of articles, obtained an act appointing four persons to be named out of each estate, who should meet twenty days before the commencement of parliament, to receive all supplications, &c. and rejecting what they thought frivolous, should engrave in a book what they thought worthy of the attention of the lords of articles. This select body would of course be appointed by the king. In 1633, when Charles I. was beginning to introduce those innovations which gave so much offence to the nation, he dreaded the opposition of his parliament, and in order to prevent it, used an act for securing in favour of the crown the lords of articles. The temporal peers were appointed to choose 8 bishops, and the bishops 8 peers; these 16 met together, and elected 8 knights of the shire, and 8 burgesses, and to these the crown officers were added as usual. In this way all the lords of articles would be the tools and creatures of the king. This practice, so inconsistent with liberty, was abolished during the civil war, and the statute of James VI. was repealed. After the reformation parliaments became more t зрь than ever; and what was only a temporary device in the reign of Charles I. was soon converted into a standing law. Upon the accession of king William III. this practice was abolished, with many other oppressive and despotic powers, which had rendered our nobles abuse flaves to the crown, while they were allowed to be tyrants over the people. Robertson's Hist. of Scotland, vol. i. p. 83.

Article, articulus, in Anatomy, denotes a joint or juncture of two or more bones of the body.

**ART**

**Article of Death.** articulus mortis, the last pang or agony of a dying person. The pope usually fetchs his benediction to the cardinals, &c. *in articulo mortis.*

**Article,** in Arithmetic, signifies the number 10, or any number justly divisible into ten parts; as 20, 30, 40, &c.

—if these are sometimes called decades, and sometimes round numbers.

**Article,** in Grammar, denotes a particle used in most languages for the declining of nouns, and denoting the several cases and genders thereof.

The use of articles arises chiefly hence, that in languages which have no different terminations to express the different cases and circumstances of nouns, there is something required to supply that office.

The Latins have no articles; but the Greeks, and most of the modern languages, have had recourse to them for fixing and ascertaining the vague signification of common and apppellative names.

The Greeks have their ον, the eastern tongues their be emphaticum, from which, perhaps, the Greek article was derived, unless we derive the Greek 0, το, from the relative ηι, or both, by a kind of contraction very common in words much used, from the demonstrative αυτος. The Spaniards and the Italians have their il, lo, and la, which appear to be the Latin ille. The French their le, la, and les, feemingly derived from either the Spanish or Italian. The Germans their der, das, dat, The English have also two articles, a and the; which being prefixed to substantives, apply their general signification to some particular things. See letter A.

Some grammarians make the article a distinct part of speech; others will have it a pronoun; and others a noun adjective. See *Speech,* and *Pronoun.*

Articles, in the distribution of the ingenious Mr. Harris, belong to the species of words which he denominates deitative; because, being associated with a noun, they serve to define, determine, or ascertain any particular object, so as to distinguish it from others of the class to which it belongs, and, of course, to denote its individuality. Although there be a near relation between pronouns and articles, and it may be sometimes doubted concerning particular words to which class they ought to be referred, yet they may be commonly distinguished by this rule; the genuine pronoun always stands by itself, affixing the power of a noun, and suppling its place; whereas the genuine article never stands by itself, but appears at all times associated to something else, requiring a noun for its support, as much as attributes or adjectives. Mr. Harris distributes articles into those strictly and properly so called, and the pronominal articles, such as this, that, any, &c. The reason and use of the former he illustrates in the following manner. When a certain object occurs, with which as an individual we are unacquainted, we refer it to its proper species, and call it dog, horse, man, or the like. If none of these names suit it, we refer it to the genus, and call it animal. But the object which we are contemplating, is perhaps neither a species nor a genus, but an individual. Of what kind? known or unknown? seen now for the first time, or seen before, and now remembered? In this case we shall discover the use of the two articles a and the. A respects our primary perception, and denotes individuals as unknown. When an object passes by which I never saw before, I say, "There goes a beaguer with a long beard." When the same man returns at some future time, I say: "There goes the beaguer with the long beard." The article only is changed, the rest remains unaltered. The individual once vague, is now recognized as something known, and that merely by the efficacy of this
Articles of great service in a language, as they contribute to the more neat and precise expressing of several properties and relations, which must otherwise be lost. Without articles, or some equivalent invention, men could not employ nouns to any of the purposes of life, or indeed communicate their thoughts at all. And hence one great disadvantage of the Latin above other languages which have articles, is, that the article being either expressed, or left out, makes an alteration in the sense, which the Latin cannot distinguish. Thus, when the devil said to our Saviour, "If thou art the Son of God, cast me into the devil's company," it may either be understood, if thou art a Son of God, or, if thou be, the Son of God. — Scaliger, from the want of articles in the Latin, has concluded them useles, and bestowed upon them approbrious language, calling the article, "osiosem logocarissimae gentis instrumentum," and the able Girard has degraded them to the humble flation of "avant-coureurs," merely to announce the approach or entrance of a noun. Mr. Horne Tooke, "Diversions of Purley," has vindicated the honour of the article, and endeavoured to restore it to its primitive dignity. For this purpose he recurs to the reafonings of Mr. Locke, on the use and importance of general terms; and he observes, that it is the business of the article to reduce the generality of terms, and, upon occasion, to enable us to employ general terms for particulars. If in some combination with a general term, it is a subtilitate, yet it is a necessary subtilitate, which (he adds) is more than can be said of abbreviations that have been advanced into distinct parts of speech, for they are not essential to the communication of our thoughts. The Italians even prefix articles to proper names, which do not naturally need any, because they of themselves signify things individually. — Thus they say, il Artifio, il Tasso, il Petrarca. — Even the French join the article to the proper names of kingdoms, provinces, &c. as la Suede, la Normandie. — And we likewise annex it to the names of certain mountains and rivers; as the Rhine, the Danube, the Alps, &c.

F. S. Buffier distinguishes a third kind of articles in French, which he calls intermedii or partitives, serving to denote part of the thing expressed by the substantives they are added to: as, "des navires anciens," "certain men have suppressed," &c.; I want "de la lumiere," "some light," &c.

The use and distinction of the definite and indefinite articles le or la, and de or dis, make one of the greatest difficulties in the French tongue, as being utterly arbitrary, and only to be acquired by practice. — We may add, that in the English, though the articles be so few, yet they are of such frequent use, that they easily discover any stranger from a natural Englishman.

ARTICULARIS, in Medicine, an epithet applied to a dicale which more immediately inflicts the articular, or joints. The morbus articularis is the same with the Greek ἀρτιχαρίς, and our gnait.

ARTICULATE Sounds are those which express the letters, syllables, &c. of any alphabetical language. Brutes cannot form articulate sounds, or they cannot articulate the sounds of their voice; excepting some few birds, as the parrot, phe, raven, hareling, &c.

ARTICULATED Libel, libellus articulatus, that wherein the parts of a fact are set forth to the judge in short distinct articles. This amounts to much the same with what is otherwise called libellus pastoralis.

ARTICULATED Leaf. See Leaf.

ARTICULATED Radius, in Natural History. See Radius Articulatus.

ARTICULATION, στρωματις, in Anatomy, the junction or connection of two bones. Articulation is technically divided into diarthrosis, or moveable articulation; synarthrosis,
Elocution; and in this sense, a good articulation consists in giving every letter in a syllable its due proportion of sound, and in making such a distinction between the syllables of which words are composed, that the ear shall, without difficulty, acknowledge their number, and perceive at once to which syllable each letter belongs. Where these points are not observed, the articulation is proportionably defective. Exactness in forming the words rightly, corresponds to propriety in spelling; and the articulation should be so clear and distinct, that the hearer may with ease keep pace with the speaker. Among the Greeks and Romans, who paid particular attention to speaking, and regularly taught it, the smallest error in pronunciation was equally disgraceful in them, as false speaking is with us. A good articulation is the foundation of a good delivery, in the same manner as the sounding of the simple notes in music with exactness, is the foundation of good fingering. As for the grofter faults of articulation, such as fluttering, hesitation, liping, and inability to pronounce certain letters, they can never be cured by mere precept, but require the constant aid of a person skilful in the causes of those faults, who by teaching each individual how to use the organs of speech rightly, and by showing him the proper position of the tongue, lips, &c. may gradually bring him to a just articulation. Demolitions, it is said, when he first spoke in public, could not pronounce the first letter of his art, "Rhetoric;" but by indurateable pains he overcame the difficulty, and supplied this deficiency in his eloquence, even after he had arrived at the age of manhood. The first and most essential point in articulation is distinctness, and its opposite is the greatest fault. The chief source of indistinctness is too great precipitancy of speech. To this hasty delivery, which drops some letters, and pronounces others too faintly; which runs syllables into each other, and clutters words together, is owing that thick, mumbling, clattering utterance, of which examples are too frequent. Demolitions had this fault; and this, it is not improbable, was the impediment or defect of speech, which he remedied by exercising himself in declaiming with pebbles in his mouth. For curing any imperfections in speech arising originally from too quick an utterance, the most effectual method will be to employ an hour every morning in reading aloud, in a manner much slower than is necessary; let a friend or some perfon attend, whose business it shall be to remind the reader, if he should quicken his pace and recur to his old habit of rapid utterance. Those words should be marked which are passed over hastily, and they should be repeatedly pronounced every morning slowly and distinctly. As in our language, words of more syllables than one have one syllable accented, and peculiarly distinguished from the rest, either by a smart percussion of the voice, or by dwelling longer upon it, the other syllables are often negligently articulated. In order to bring thofe, whose utterance is so rapid, to a due medium, they should accustom themselves to pronounce the unaccented syllables more fully, and to dwell longer upon them. See S. Sheridan's Lectures on Elocution, p. 19—29.

Articulation, in reference to Grammar, is that part of it which treats first of sounds and letters, then of their combinations, for the composing of syllables and words. Hence he who pronounces his words clearly and distinctly, is said to pronounce them articulate.

Articulation, in Vocal Music. This word, which belongs to every kind of elocution, as well as music, is too familiar to be called technical. Yet, as it is extremely important, and much neglected, it shall furnish an article.

Mr. Fra-
The Roman artificers had their peculiar temples, where they assembled, and chose their own patron, to defend their causes: they were exempted from all personal services. Tertullian places Peter the Apostle thirty-two species of artificers, and Constantine thirty-five, who enjoyed this privilege. The artificers were incorporated into divers colleges or companies, each of which had its tutelar gods, to whom they offered their worship; and several of these, when they quitted their profession, hung up their tools, a votive offering to their gods. Artificers were held a degree below merchants, and argentarii, or money-changers, and their employment more forlorn. Some deny, that in the earliest ages of the Roman state, artificers were ranked in the number of citizens; others, who affect their citizenship, allow that they were held in contempt, as being unfit for war, and so poor that they could scarce pay any taxes. For which reason they were not entered among the citizens, in the censor’s books; the dignity of the census being only to see what number of persons were yearly fit to bear arms, and to pay taxes towards the support of the state. It may be added that much of the burdens of artificers was done by slaves and foreigners, who left little for the Romans to mind but their husbandry and war. Dion. Hal. lib. ii. By means of the arts, the minds of men are engaged in inventions beneficial to the community; and thus prove the grand preferential against the barbarism and brutality which ever attend on an indolent and inactive stupidity.

By the English laws, a stranger being an artificer in London, &c. shall not keep above two stranger servitors; but he may have as many English servants and apprentices as he can get. 21 Hen. VIII. c. 15. And as to artificers in wool, iron, steel, brass, or other metal, &c. perfons contracting with them to go out of the kingdom into any foreign country, are to be imprisoned three months, and fined in a sum not exceeding one hundred pounds. And such as going abroad, and not returning on warning given by our ambassadors, &c. shall be disabled from holding lands by deverit or devise, from receiving any legacy, &c. and be deemed aliens. Stat. 5 Geo. I. c. 27. By 23 Geo. II. c. 13. § 1. penalty of 500l. and of imprisonment for twelve months, for the first offence; and for the second, of 1000l. and of imprisonment for two years, is also inflicted on persons seducing artificers to go abroad. By 14 Geo. III. c. 71. 17 Geo. III. c. 5. and 21 Geo. III. c. 57. heavy penalties are inflicted on masters of ships affiling in such seduction. See Manufacturers.

Ramazini has a treatise on the diseases of artificers. Artificer by fire, a denomination sometimes given to chemists and workers in metal. ARTIFICIAL, something made by art; not produced naturally, or in the common course of things. Artificer is also frequently used for aforament. Thus we have artificial amoniacal, artificial borax, &c. Artificial fireworks are compositions of inflammable materials; chiefly used on solemn occasions, by way of rejoicing.

Artificial Graffes, in Agriculture, are such grasses as are introduced into field husbandry, and cultivated either for the purpose of being made into hay, or for being fed off by cattle. Clover, lucerne, fawnfoin, trefoil, rye-graft, and some others are of this nature. See these different heads.

The cultivation of artificial grases has been practiced in some districts of the kingdom for more than a century, while in others it has only been attended to within these few years, and there are still other that have but yet begun to introduce these kinds of grases. Wherever they have, however, been properly cultivated, so various and so manifold have been found
found the advantages arising from them, that they form a very
lucrative branch of husbandry, and are consequently grown in
abundance in many parts of the kingdom. Those which, ac-
gording to the author of the Synopsis of Husbandry, are
most usually propagated and found to bring the most con-
durable profit to the farmer, are fainty-fon, or cinquefoil,
clover, trefoil, hop-clover or non-fuch, and lucerne. One
or other of these different species of grasses may indeed be
beneficially cultivated on almost every soil; as where the
povery of the ground will not admit of sowing either lu-
cerne or clover, fainty-fon or trefoil, from their requiring a
les depth of mould, may turn out a weighty crop. Saint-
fom, clover, and trefoil, are indeed now so universally raised
from seed of English growth, that they have become in a
manner naturalized to the soil, there being scarcely any
country in Europe where larger crops are grown than in this.
Lucerne, though it be sometimes referred for seed here, is
most successfully raised from seeds of foreign growth. In
respect to burnet, spurry, and timothy grasses, which are by
some confidered as artificial grases, although their virtues
have been highly celebrated by many, they have, perhaps,
but seldom, it is observed, been found to answer in the cul-
tivation in any degree equal to the fangone commendations
bestowed on them.

It is judiciously remarked by Mr. Kent, in the Agricultu-
ral Survey of Norfolk, that artificial grasses should always
be chosen agreably to the soil. Saint-loin should, says he,
bet introduced where there is a chalky, marshy, or even a
gritty bottom. White clover should be the principal grass,
where land is designated to be laid for a continne. Trefoil
and burnet upon high and poor uplands, designed for sheep-
waks. Perennial darnel, or what the farmers call rye-
grafs, is, he thinks, proper upon light arable land, for
though it is an exhauder, it serves better than any other to
brace the surface. A few acres of lucerne he likewise recom-
ends to every farmer who has a piece of loamy tillage, and
near his house.

And in the survey of the County of Somberit it is
remarked, that on the stone-bright and free-stone, or soils
faint-fon takes the lead; and that though the feed is very
expensive, the quantity and quality of its produce, together
with its durability, make an ample return of profit, particu-
larly if sown when the land is clean. Next to faint-fon, rye-
grafs, marl-grafts, and white Dutch clover, are in defered
repute, when the land is intended to remain some years in
grafts; but when it is intended to be ploughed again in the
course of a year or two, broad clover is preferred to all other
artificial grases. It is remarked, however, in the able Survey of
Worthington, that there few of the artificial grasses are
ever grown alone, except red clover, when intended to con-
tinue only one year, and even a small portion of rye-
grases, as from one to three gallons per acre, are generally
town with it; and the writers foppled, with much propri-
ety, as it not only comes early in the spring, but thickens
the crop and facilitates making the clover into hay. When
the land is intended to continue for three or more years in
grafts, they are generally mixed in the proportion of eight
or ten pounds of red clover, four pounds of white clover,
and half a bushel of rye-grafts seed per acre; to the above
quantities are sometimes, it is observed, added three or
four pounds of rib-grafts and hopmedick, as the soil fuits. See
Grass.

Artificial Lighting. See Electricity, and Light-
ing.

Artificial Lines on a sector or scale, are certain lines
so contrived, as to repreffent the logarithmic lines and
tangents; which, by the help of the line of numbers, will
solve all questions in trigonometry, navigation, &c. pretty
exactly.

Artificial Magnets. See Magnets.

Artificial Music, that which is composed according to
the rules of art. There is no natural music but the warbling
of birds, which is confined to the melody of the avairy,
of which the tones are too high, and the intervals too mi-
ute for our appreciation. Rigorously speaking, all music is
a work of art, particularly instrumental, in which the instru-
ment itself is an artful contrivance for imitating vocal tones,
and the hand of the performer must be guided by art. But
the artifaces of composition and performance are innumera-
able. In composition, fugues, canons, double counterpoint, in-
genious and elaborate accompaniments, are included in artifical
music; and in the performance upon instruments, the arti-
aces of bowing on the violin, fingering on keyed instruments,
double tonguing on the German flute, &c. are only known
and taught by great masters. The generating musical tones
from glades and other substances, not included in the three
expedients for producing sounds by instruments, which the
ancients as well as the moderns have confided to three seve-
rable species, as strings, pipes, and percussion, is double en-
tiled to the epithet artificial. The harmonies of a fingle
string on the Ayolian harp, have, perhaps, a better claim to
the title of natural music, than any other sounds produced
without human assistance.

Artificial Pastures, in Agriculture, such pasture grounds
as have been cultivated and tawn down with plants of the
artificial grases kind, or such others as are capable of af-
ording a large proportion of green food for the feeding of
beasts and other animals. See Pasture.

Artigis, in Ancient Geography, a town of Spain,
in the county of the Turduli, supposed to be the present
Albama, between Grerado and the sea.

Artigni, Anthony Gachet, in Biography, a writer of lit-
erary history, was born at Vienna, and became
confer of the archiepiscopal church of that city. His work,
titled, "Memoires d'Histoire de Critique et de la Litter-
ature," published in seven volumes 12mo. at Paris in 1749,
manipulated considerable talents for literary research and criti-

Artik-abad, in Geography, a town or district of
African Turkey, in the government of Siwas, between the
town of Siwas and that of Tocat or Tokai; abounding
with grain and fruit.

Artillery is originally a French word signifying
archery. In a general sense, it denotes the offensive appa-
rate of war, particularly of the missile kind; and in mo-
dern acceptation, is more immediately applied to fire-arms
mounted on carriages, and ready for action, with their
balls, bombs, grenades, &c. In a more extensive meaning,
the term includes the powder, matches, utensils of ord-
mance, the machines which facilitate their motion and trans-
port them, the vehicles on which their traverse mires,
every thing necessary to them, and all that enters into
the form of a train of artillery. The same word, fll
farther extended in its meaning, likewise comprehends the
men destined for the service of the artillery, the people who
provide the artillery with materials and implements when
engaged, the cannoniers, the bombardiers, the officers of
every rank, and engineers of every kind. By artillery is like-
wise understood the science which the officers of artillery
ought to poiffes. See Engineering.

In the most ancient times, when war was made with
quicknefs and impetuoufity, the use of artillery was un-
known. Something like military engines feem hinted at in
the book of Deuteronomy (chap. xx. v. 20.); but the ear-
ch
left precise mention of artillery is in the second book of Chronicles (chap. xxvi. v. 15.), where we are told, that Uzziah, who began his reign 809 years before the Chaldaean war, "made in Jerusalem engines invented by cunning men, to be upon the towers and upon the bulwarks, to stout arrows and great stones withal." This also is particularly mentioned by Josephus, who represents Uzziah's care of Jerusalem as toward the end of his reign.

The Greeks, who were defrass of appropriating to themselves every improvement of science that gathered from the East, would fain have been believed the inventors of artillery. But so far from being in possession of artillery, they had not in their early times, if we may judge from Homer's writings, one military engine that was calculated to shake a wall. The earliest influence in prose history is probably to be fought for in the siege of Mitya, about 370 years before Christ, where Dionysius, having battered the fortifications with his rams, advanced to the walls, towers rolled upon wheels, whence he galled the beleaguered with continual volleys of arrows and stones thrown from his catapults. (Anc. Univ. Hist. vol. vi. 401.) The most memorable instance that occurs is the siege of Rhodes by Demetrius Phoecetes, where even Grecian ingenuity was exhausted in the invention and improvement of artillery. (Diod. Siculus, l. xxi.) Another instance of notoriety occurs when Hannibal beleaguered Saguntum, 219 years before the Chaldaean war; and the Saguntines hindered his soldiers from using the battering-ram, by an incessant hurling of darts, stones, and other missile weapons. See the account in Livy (l. xxi. c. 7. edit. Freindii), who has also supplied us (l. xxvi. c. 46, 47.) with a curious inventory of the warlike engines which Scipio, eight years afterwards, found among the stores of Carthagenia. There were no less than an hundred and twenty catapults of the larger size, two hundred and eighty-one of the smaller; of the greater balistae twenty-three, of the lesser fifty-two; besides an innumerable quantity of scorpions of different sizes, arms, and missile weapons. Two years, however, previous to this, Marcellus had laid siege to Syracuse, a city proverbially fatal to the arms that attacked it. Archimedes was at that time resident in Syracuse; and at the earnest solicitation of Hiero, king of Sicily, exerted the powers of his mind in the invention of artillery and other warlike engines. Marcellus had brought with him an amazing engine called lambaca, upon eight galleries; which the mathematician destroyed by discharging little flint stones of enormous weight upon it, while it was at a considerable distance from the walls. The chief instructions he used were balistae, a sort of crown lowered by a lever, which hoisting the ships of the Romans by the prow, plunged them to the bottom of the sea; grapples; and scorpius. Archimedes, however, left no account of these military engines in writing; because he considered all attention to mechanics as mean and forlorn, placing his whole delight in those intellectual speculations which, without any relation to the necessities of life, have an intrinsic excellence arising from truth and demonstration only; and reckoning such inventions but among the amusements of geometry. See the life of Marcellus in Plutarch.

To multiply the enumeration of ancient sieges where artillery was used, would not only be tedious but endless. Every siege, it is probable, gave rise to some invention or improvement. Tacitus indeed mentions an extraordinary instance (Hist. 1. iii. c. 23. 29.) of an engine with which the fifteenth legion fought against the troops of Vespasian, at Cremona. It was a balista of an enormous size, which the Vitellians played off with dreadful execution; and discharged maffy flones of weight to crush whole ranks at once. Inevitable ruin, we are told, must have followed, if two folders had not signalled themselves by a brave exploit. Covering themselves with the shields of the enemy, which they found among the slain, they advanced undiscovered to the battering-engine, and cut the ropes and springs. At last, after vigorous assailnt from Antonius, the Vitellians being no longer able to sustain the shock, and engaged at their disapposition, in a fit of despair, rolled down their battering-engine on the heads of the besiegers. Numbers were crushed by the fall of such a prodigious mass. It happened, however, that the machine drew after it a neighbouring tower, the parapet and part of the wall affording the besiegers an easier access to the city. The continued use of these enormous engines must be remembered by every reader of history; as well as that the Romans had regular batteries both of balistae and catapults.

The credit of introducing artillery into our own country must undoubtedly be given to the Normans, whom William of Malmsbury describes (l. iii. p. 57. col. 1.) as having a peculiar delight in war, and assuring us, that they excelled in all the arts of attacking their enemies, when their forces were sufficient. The Normans first introduced among their calls the key, placed upon a mount, whence they aimed the surrounding enemy with their darts, stones, and other offensive weapons. (Strutt's Manners and Customs of the English, vol. i. p. 93.) Their method of attacking castles seems generally to have been by mere force; blockade was little practised; and the iron ram, which the Romans found so serviceable, was rendered in a great measure useless by the deep ditches which surrounded their fortifications. The principal machines which the Normans employed, were of course of the projectile kind; and they were not only used in regular sieges, but occasionally fo contrived as to be used on flipp-board. See Matt. Paris, p. 1097.

Machines for throwing stones occur fo early as in the battle of Hastings (Will. Pechavi, p. 201.) and Robert de Brune's, in his wars against the Saracens, informs us, that when Richard the Firil let out against the Holy Land, he had in his barges and galleys mills turned by the wind which by force of the fails threw fire and stones.

The benefit which the English manners derived from the crusades, is a topic on which we shall have other opportunities of enlarging; but the accession to the knowledge of our ancestors in the art of war were singularly conspicuous. From the Saracens they obtained a sort of wild-fire of fo subtile a composition, that there was no method of extinguishing it but by smothering it with heaps of dust or vinegar. It was by this device that the Black Prince set fire to Remonentoe; and it was often thrown in pots from the catapulta.

The Greek and Roman writers afford us many instances of the superior force which the catapults and balistae of the ancients could occasionally display; nor are parallel instances wanting in the annals of Britain. Camden informs us, that with the mangonels, trebuchets, and bricades, our forefathers used to cast forth mill-stones; and Helinphild (p. 539.) relates, that when Edward the Firil besieged Stretford castle, he cauht some engines of wood to be raised against it, which shot off stones of two and three hundred weight.

The catalogue of projectile machines in the seventh and twelfth centuries, exclusive of the balista, catapulta, onager, and scorpiion, were the mangonel, the trebuchet, the perraty, the robinet, the matagueison, the briquelette, the bugle or bible, the espingral, the matafunda, the ribadequin, engine a verge, and the war-wolf (Grose Mist. Hist. vol. i. p. 381.)
whose form, construction, and particular history, will be described under their respective articles. Singular, however, as it may seem, not only the form of these curious instruments, but even the method of using them, is entirely lost. And so defective have our historians been in this particular, that after all the strict examinations that have been made, little more of some of them can be collected than their names.

The connection between the modern and the old artillery need hardly be preceded by recapitulating the discovery of gunpowder. For some time after that singular composition was applied to military purposes, the machines and pieces of ordnance were very ponderous and unwieldy, and of course unfit for expeditions service. Military people at that time possessed but a small share of learning of any kind, and almost none at all of a mechanical or mathematical nature. What they did in their profession was entirely the effect of practice. The form of their artillery, as well as of the warlike engines and instruments for conducting it, was only such as the most obvious hints suggested, or the rudest and most uncultivated invention dictated. Their first pieces were not only clumsy and unmanageable, but as they succeeded to the machines of the ancients, they were employed like them in throwing flames of a prodigious weight, and therefore were necessarily of an huge and enormous bore, confining usually of pieces of iron fitted together lengthways, and hooped with iron rings. Some of them were so large that they could not be fired above four or five times a day. Such were those with Mahomet II. battered the walls of Constantinople in 1453, being some of them of the calibre of no less than twelve hundred pounds; and Guiccianini, in the first book of his History, informs us, that a large portion of time interfered between the different chargings and dischargings of one of these pieces, that the besieged had sufficient time to repair at their leisure the breaches made in their walls by the shock of such enormous stones. (See Glennie's Hist. of Gunery, p. 1.)

After such a relation we cannot be surprized to find that not only the moveable towers, but catapults of various descriptions, were retained in use. The extreme awkwardness visible in the construction of cannon, and the great cost of gunpowder, added to the difficulty of procuring it, account for the preference which was still given to the old engines for discharging stones. Henry V. in the fourth year of his reign, employed the tripet, which threw that cannon had not then superseded the old artillery. (Strutt's Manners and Customs, vol. ii. p. 52.)

Under Henry III. of France, the use and practice of artillery was not advanced beyond its infancy. D'Estrees, who occupied the point of matter-general of the ordnance, in 1558, at the siege of Calais by Francis duke of Guise, and who eminently conducted in its capture, was the first person among the French who made any considerable progress in the construction of batteries. Anterior to D'Estrees, continual accidents took place from the burbling of cannon; and it was customary to cool them with vinegar, in order to prevent misfortunes. Armies were then but slenderly provided with artillery, which was considered as more requisite for sieges, than indispensible for the operations of the field. (See Wraxall's Hist. of France, vol. ii. p. 249, 250.) In England, however, the science of artillery had occupied attention at a more early period; and lord Herbert observes, that in 1544, king Henry VIII. had himself invented small pieces of artillery to defend his waggons.

The length and diameter of cannon were by degrees much diminished, and of course their weight; and practice and experience in time discovered how much might be reduced with propriety from their magnitude, without hurting the grand effects which it was necessary on some occasions they should produce. See Cannon, Gunery, and Projectiles.

Dr. Smith observes (Wealth of Nations, vol. iii. p. 79), that the great change introduced into the art of war by the invention of fire-arms, has enhanced still farther both the expense of exercising and disciplining any particular number of soldiers in time of peace, and that of employing them in time of war. Both their arms and their ammunition have become more expensive. A small but a more expensive machine than a javelin or a bow and arrows; a cannon or a mortar, than a balista or a catapult. The powder which is spent in a moderate review is lost irrecoverably, and occasions a very considerable expense. The javelins and arrows which were thrown or shot in an ancient one, could safely be picked up again, and were besides of very little value. The cannon and the mortar are not only much dearer, but much heavier machines than the balista or catapults, and require a greater expense, not only to prepare them for the field, but to carry them to it. As the superiority of the modern artillery over that of the ancients, is very great, it has become much more difficult, and consequently much more expensive to fortify a town so as to resist even for a few weeks the attack of that inferior artillery. In modern times, many different causes contribute to render the defence of society more expensive. The unavoidable effects of the natural progress of improvement have, in this respect, been a good deal enhanced by a great revolution in the art of war, to which a mere accident, the invention of gunpowder, seems to have given occasion.

Artillery-Park, the place in the rear of both lines in the army for encamping the artillery, which is drawn up in lines, of which one is formed by the guns; the ammunition waggons make two or three lines, sixty paces behind the guns, and thirty distant from one another; the pontoon and tumbrils make the last line. The whole is surrounded with a rope, which forms the park; the gunners and maroilles encamp on the flanks; and the bombardiers, pontoon-men, and artificers, in the rear. Of late, when an army has been upon the point of engaging, or in expectation of an action, the artillery has been encamped in two parks, upon both flanks.

Artillery, Train, or Train of, a certain number of pieces of ordnance mounted on carriages, with all their furniture, fit for marching.

Artillery Company, the, had its origin about 1585, when London being wearied with continual matters, a number of its gallant citizens who had served abroad with credit, voluntarily exercised themselves, and trained others to the ready use of war. The ground they used was at the north-west extremity of the city, nigh Bishopsgate, and had before been occupied by the "fraternity of artillery," or gunners of the Tower. Within two years there were near three hundred merchants and others sufficiently skilled to train common soldiers; and in 1588, some of them had commissions in the camp at Tilbury; but their association soon after fell to decay. (Ellis's History of Shoreditch, p. 341.) From the company's register, the only book they faxed in the civil wars, it appears that the association was revived in 1611, by warrant from the privy council; and the volunteers soon amounted to fix thousand. Three years after this they made a general muster, when according to contemporary authority, the men were better armed than disciplined. (See Nicoll's London Artillery, p. 104.) In 1622 they erected an armoury, towards
towards which the chamber of London gave above 300 l.; it was furnished with five hundred sets of arms of extraordinary beauty, which were all lost in the civil wars. Their captain, during a part of those affrighted times, was a Mr. Manby, who irrecoverably detained, for his own purposes, the arms, plate, money, books, and other goods of the company. The protector was in vain solicited to enforce their being restored. (Elkin's Hist. of Shored. p. 349.) In 1660 they quitted their old field of discipline, and entered upon a plot of ground in Bunhill-fields, leased to them by the city.

This company, at present, forms a regular battalion of infantry, consisting of a grenadier, light infantry, and bat divisions; together with the maroon division for the use of two field pieces, presented in the year 1783, by the city. There is also kept up a division of archers; archery being the art cultivated by the company in days when the bow was an instrument of war. The command of the battalion is vested in officers who are annually elected. This municipal corps is authorized and privileged by many royal patents and warrants; and particularly by one of his present majesty, under the royal sign manual, wherein his royal highness the prince of Wales is declared captain-general. It consists of gentlemen of character and property, bound by a solemn declaration and obligation of attachment and fidelity to the king and constitution, and of readiness to join in supporting the civil authority, and defending the metropolis. It is regulated by a court of affidavits, consisting of a precentor, vice-president, treasurer, the field officers; the lord mayor, aldermen, and sheriffs for the time being, and twenty-four elective members. (See the company's address to the inhabitants of London.)

Artillery is also used for what we otherwise call pyrotechnia, or the art of fire-works, with the instruments and apparatus belonging to it.

Artificers, in Geography, one of the Pelew Islands in the Pacific ocean.

Artisen, in Ancient Geography, a place of Asia Minor, in Ionia.

Artisan. See Artist, and also Artificers, and Manufacturers.

Artisiga, in Ancient Geography, a village of Africa, in Mauritania-Casariensi, situated on the seacoast north-west of the mouth of the river Malva, about 27 miles west of Siga.

Artiscus, in Medicine, from aeio, bread, denotes a trochee, but more particularly that prepared of viper's delth, mixed up with bread, to be used in the composition of Venice treacle. These are more particularly called artifci theurici, or theriacal troches. They were formerly in great vogue, and brought with much parade from Venice; but Zweifel discovered their vanity; since which time viper's powder has been generally sublimated for them, in the preparation of the treacle.

Artison, in Natural History, a common name among the French for various kinds of insects that injure furniture, skins, fluffs, &c. such as the Dermeltes, Mitres, &c.

Artist, in a general sense, a person skilled in some art; or, according to Mr. Harris's definition, a person polishing an habitual power of becoming the cause of some effect, according to a system of various and well-approved precepts. In this sense, we say, an excellent, a curious artist. The pre-eminence is disputed between ancient and modern artists, especially as to what relates to sculpture, painting, and the like. At Vicenza, we are told of a privilege granted to artists, like that of clergy in England; in virtue of this, criminals adjudged to death save their lives, if they can prove themselves the most excellent and consummate workmen in any useful art. This benefit is allowed them in favorem artis, for the foul offence, except for some particular crimes, of which coinage is one. The exception is just, since here the greater the artist, the more dangerous the perfon. Evelyn's Disc. of Medals, ch. vii. p. 237, &c.

Artists are persons who practise those arts which must necessarily be combined with a considerable degree of science, distinguishing them from such as are proper artisans or mechanics. Artists are particularly those who study and effect what are termed the polite arts, i.e., painting, sculpture, and architecture, to which may be added engraving. An account of the most eminent artists, ancient and modern, will be found in this work alphabetically arranged, to which our readers are referred. It appears that all civilized nations in every age have produced artists, and that with a degree of excellence generally answerable to their civilization and opulence. In every nation where the arts have flourished, the artists have made but rude efforts, and by degrees they have been nurtured up to excellence, except in such insular cases where they have been transplanted, as from Greece to Rome. It is universally acknowledged respecting statuary and architecture, that ancient Greece has produced the best artists in the world; their works have escaped the ravages of time and are the lasting monuments of their fame, and are still considered as the models of perfection; there is however an uncertainty whether their painters were equally skilful with their statuaries. With some reason, many judicious persons have supposed they were not, while others contend, that so much excellence produced in one branch, must have contemporary artists who would excel in the other also. While we cannot doubt of the genius of the Greek artists, and of their ability to produce works of excellence, yet it may not be allowed that this argument will be found to be so conclusive as it may at first appear, since Chinese and Indian models are found in a more perfect state than either their drawings or paintings. Sir Joshua Reynolds has given a hint upon this subject in his notes to Mr. Mason's translation of Du Fresnoy, which may be consulted upon one side of the question; and Mr. Webb, on the other, will not fail to interest any reader who may be inclined to believe in favour of ancient painters. When the Goths overran Italy, the arts were destroyed; and, with Greek architecture, painting, and sculpture, lay in one common grave forgotten, until they revived under some artists in the twelfth and thirteenth centuries, who ought not to be named as artists, but for the succeeding effects to which their efforts prepared the way, and in a short time after produced Michael Angelo, Raphael, Corregio, Titian, Algarde, Bernini, &c. painters, sculptors, and architects, to whose works the living artists are almost as much indebted as these illustrious characters were to the ancient monuments they dug from the ruins of old Rome. While painters continued to pursue their wretchedly dry and barbarously Gothic method of design, prior to these enlightened artists, even then, the bronze gates of the baptistry of the church at Florence were produced; upon a figh of which, M. Angelo cried out with emotion when he saw them, that they deserved to be the gates of paradise! Calls of these gates may be seen in the Royal Academy in London. This we notice to justify a remark which we have made, that painting does not always accompany with equal steps the efforts of sculpture.

An Englishman will observe with pleasure the progress which has lately been made, and is still making under the protection of our gracious sovereign, in this once barren land, by artists in painting, sculpture, and architecture.
ART

ARTIFIC, artifi, in an academical sense, denotes a philosopher or proficient in the faculty of arts. See Arts.

Artifex is more peculiarly understood of a chemist or alchymist. In which sense it is that Paracelsus and other adepts use the word.

ARTIZOZ, from Διά, short, and ζως, life, is used by some ancient physicians for an infant short-lived, by reason of a difficult birth, whereby he was long detained in the passage from the womb.

ARTOARIA, in Ancient Geography, a town of India on this side of the Ganges. Ptolem. Artocarpus, a town of vindelicia, mentioned by Ptolemy, and supposed by some to be Altzburgh in Bavaria on the Danube, below Ingoldstadt; but by Cluverius, to be Laban on the Saltzburgh, below Lauffen, in the archibishopric of Saltzburgh.

Eff. Gen. Char. Male, amnent, calyx none. Cor. two-petalled. Female, Cal. and Cor. none; style one; berries one-seeded, connected, and forming a roundish mucrinated fruit.

= Fructu appense, fruit without seeds. = Fructu feminino, with seeds in the fruit.

Leaves grafted. Forlir, whole description of this tree appears to be more complete than that of any other species. It is the thickness of a man and upwards of forty feet high. The shoots are upright, the wood soft, smooth, and yellowish, the inner bark white, composed of a net of tilius fibers, the outer bark smooth, but full of chinks, pale ash-colour, with small tuberces thinly scattered over it. Wherever the tree is wounded, it pours out a glutinous milky liquor. The branches form an ample almost globular head; the lower ones, which are the longest, spring from the trunk ten or twelve feet above the ground, spreading almost horizontally, scattered, and in a form of whorl; twigs ascending, bearing flowers and fruit at their ends. Leaves alternate, petioled, oval, deeply divided above the middle into seven or nine lancolate acute lobes, with rounded inlines; they are otherwise quite entire, smooth on both sides, even, spreading, bright green, palm beneath, membraneous, a foot and a half in length, eleven inches wide, veined, having a thick nerve to each lobe, diverging from the common rachis. The younger leaves, like all the more tender parts of the tree, are glutinous to the touch; petioles roundish, even, ascending, two inches in length; lippes in pairs, involving the younger leaves, lanceolate, acuminate, concave, entire, smooth within, hairy on the outside, decumbent, three inches long; peduncles at the ends of the twigs, and in the axils of the upper leaves, solitary, round, upright, having a few hairs, and two inches in length. The male flowers are among the upper leaves; and the female flowers at the ends of the twigs. The male amnent is club-shaped, flabby, upright, a span long, covered with immemorial small, soft little flowers. The proper perianth is very small, two-valved; valves equal, oblong, blunt, concave, closely adhering, yellow, or yellow-brown, These have no stamens. The female flowers have twelve stamens, ovate-lanceolate, compressed, thread-like, spreading, upright, bent at the tip, flat, a span in length, at first closed, then deciduous, placed at the end of the peduncle; fls globular, covered with many conuate germs, these are obconical, immersed in the receptacle, somewhat convex at the top; styles feebly any; fls projecting points, withering in some varieties these are biled, according to Thunberg. The fruit is a globular berry, smoothish, marked with hexagons on the surface, pale green, often nine inches in length, filled with a white, farinaceous, somewhat fibrous pulp, which, when the fruit is ripe, becomes juicy and yellow; it is fattened to a club-shaped, flabby receptacle, which is longitudinally fibrous, and a hand in length.

In Captain Cook's voyage it is observed, that the breadfruit tree is about the size of a middling oak; its leaves are frequently a foot and a half long, oblong, deeply incised like those of the fig-tree, which they resemble in consistence and colour, and are very edible when young. The tree is the size and shape of a child's head, and the surface is reticulated not much unlike a truffle; it is covered with a thin skin, and has a core about as big as the handle of a small knife; the edible part lies between the skin and core; it is as white as sawdust, and of the consistence of new bread. It must be roasted before it is eaten, being first divided into three or four parts; its taste is insipid, with a slight sweetness, somewhat resembling that of the crumb of wheaten bread mixed with Jerusalem artichoke. The fruit not being in season all the year, there is a method of supplying this defect, by reducing it to four parts called mabie; and besides this, cocoa-nuts, bananas, plantains, and a great variety of other fruits, come in aid of it.

This tree not only supplies food, but also clothing, for the bark is stripped off the suckers, and formed into a kind of cloth. To procure the fruit for food, coots the Otaheitean trouble or labour; but they are easily procured, as it should not indeed shoot up (approximately, yet, as Captain Cook observes, "if a man plant ten trees in his life-time, he will as completely fill his duty to his own and future generations, as the native of our less temperate climate can do by ploughing in the cold winter, and reaping in the summer's heat, as often as these seasons return; even after he has procured bread for his present household, he should convert a surplus into money, and lay it up for his children. But where the trees are once introduced in a favourable foil and climate, so far from being obliged to renew them by planting, it seems probable that the inhabitants will rather be under the necessity of preventing their progres; for young trees spring abundantly from the roots of the old ones, which run along near the surface. Accordingly they never plant the bread-fruit tree at Otaheite." The breadfruit is distinguished into that which is diffusible of seeds, and that in which seeds are found. The natives of Otaheite reckon at least eight varieties of trees which produce the former. The most common of these is named aru or ceroo, bearing a globular, smooth, even fruit. The maira has an oval, smooth fruit, with the leaves more deeply cut. The petea has a fruit oblong and rough, with a feyly appearance. The tatoria has an oval fruit, with mammillary germs, muri- cated by the permanent style. Probably, by extending the culture
cultural to distant countries, the varieties may be still farther increased. The parts of fruitation in those trees which bear fruit without stones, are said to be defective, as the amount never expands, and the styles are also deficient. In the variety \( \beta \), the fruit contains a considerable number of seeds, almost as large as chestnuts, oblong, somewhat angular, produced into a point at each end. They are farinaceous like the chestnut, and are eaten in some places by the savage inhabitants, either boiled, or roasted in embers. It will easily be supposed that this fruit, abounding in pulp, and being both more fibrous and less juicy than that which has no seeds, must be much inferior as an article of food; and, accordingly, before the discovery of the South Sea islands, the bread-fruit had not acquired that degree of reputation which it is now found to deserve. It has been long known in many parts of the East Indies, but not being wanted there for food, and consequently not having received any degree of cultivation, it has continued nearly in its natural state, without receiving that improvement from the care of men, which probably necessity first urged them to exercise. Accordingly, Captain Cook remarked the great inferiority of the fruit which he found at Batavia, to the cocoa of the South Sea islands.

This most useful tree is distributed very extensively over the East Indian continent and islands, as well as the inhabitable islands of the South Seas. It was found by Dampier in the Ladrones islands: it is a native of Ambon, Banda, and others of the Molucca islands: of Java and others of the Maldives islands: of Timor, Bule, and Madura, of Prince's island, &c. M. Sonnerat conveyed some of the trees from the island of Luzon to the isle of France. M. Poivre naturalized them both there and in the isle of Bourbon: and they are cultivated both in Malabar and Coromandel. In the South Seas both varieties are still found in the Marian islands, in the Nue Britton, and Friendly islands; but most abundantly in the Society, Marquesas, and Sandwich islands. In Otaheite however, and some others, the evident superiority of the seedless variety for food, has caused the other to be neglected, and it is consequently a most worn out. We are informed by captain King, that in the Sandwich islands these trees are planted and flourished with great luxuriance on rising grounds; that they are not indeed in fine abundance, but that they produce double the quantity of fruit which they do on the rich plains of Otaheite; that the trees are nearly of the same height, but that the branches begin to strike out from the trunk much lower, and with greater luxuriance; and that the climate of these islands differs very little from that of the West Indian islands, which lie in the same latitude.—This reflection probably first suggested the idea of conveying this valuable tree to our islands in the West Indies. For this purpose, his majesty's ship the Bounty failed for the South Seas, on the 23d of December 1787, under the command of lieutenant William Bligh. But a fatal mutiny prevented the accomplishment of this benevolent design. His majesty, however, not discouraged by the unfortunate event of this voyage, and fully impressed with the importance of securing so useful an article of food as the bread-fruit to our West Indian islands, determined, in the year 1791, to employ another ship for a second expedition on this service, and in order to secure the success of the voyage as much as possible, it was thought proper that two vessels should proceed together on this important business. Accordingly, a ship of four hundred tons, named the Providence, was engaged for the purpose, and the command of her given to captain Bligh; and a small tender called the Affiant, commanded by lieutenant Nathaniel Portlock. Sir Joseph Banks, as in the former voyage, directed the equipment of the ship for this particular purpose. Two skilful gardeners were appointed to superintend the trees and plants, from their transplantation at Otaheite, to their delivery at Jamaica, and captain Bligh set sail on the second of August 1791. He arrived at Teneriffe on the twenty-eighth, at St. Jago on the thirteenth of September, and at the Cape of Good Hope on the twentieth of November. He failed from thence on the nineteenth of December, arrived at Adventure's Bay on the ninth of February 1793, and at Otaheite on the eighth or ninth of July. The business of procuring and embarking the bread-fruit trees, &c. took up three months and nine days; though the natives of Otaheite gave all possible affability to Captain Bligh and the gardeners. They failed on the eighteenth or nineteenth of July; arrived at Coupang in Timor on the second of October; at St. Helena on the seventeenth of December, and at St. Vincent's on the twenty-second of January 1794. Here they stayed seven days, to leave a part of their cargo, and on the fifth of February they arrived at Jamaica, and delivered the remainder. The number of plants taken on board at Otaheite, was 465, in 1281 pots, tubs, and cases; and of these 1751 were bread-fruit trees. When they arrived at Coupang, 252 plants were dead, but the rest were in good order. Here they procured ninety-two not of the fruits of that country. They arrived at St. Helena with 870 live bread-fruit trees, besides other plants. Here they left some of them, with different fruits of Otaheite and Timor, besides mountain rice and other seeds; and from hence the East Indies may be supplied with them. On their arrival at St. Vincent's, they had 551 cases, containing six hundred and seventy-eight bread-fruit-trees, besides a great number of other fruits and plants to the number of 1445. Near half this cargo was deposited here under the care of Mr. Alexander Anderson, the superintendent of his majesty's botanical garden, for the use of the Windward Islands; and the remainder, intended for the Leeward Islands, was conveyed to Jamaica, and distributed as the governor and council of Jamaica pleased to direct. The exact number of bread-fruit-trees brought to Jamaica was 425, out of which five only were reserved for the botanical garden at Kew. Though the principal object of this voyage was to procure the bread-fruit trees, it was not confined to this only, for the design was to furnish the West Indian islands with the most valuable productions of the South Seas and the East Indies. Accordingly, the gardeners were instructed to procure plants of sweet plantain called \( \text{meda} \), the Otaheitean apple or \( \text{oova} \), the root called \( \text{pab} \), of which the islanders make a kind of pudding, and a species of yam much larger and better than any in the West Indies. They were also to obtain at Timor and other places in the East Indies such plants and fruits as are used for food or otherwise by the natives, as the \( \text{lajji} \), \( \text{mangelam} \), durian, \( \text{jambo} \), \( \text{nanea} \), \( \text{tehampadda} \), blimming, \( \text{jaloblan} \), \( \text{bathvar} \), \( \text{fale} \), \( \text{bleek} \), long pepper, &c. together with some bulks of dry or mountain rice, which is cultivated without being overflown with water; and they were to make themselves acquainted with the mode of managing it in order to communicate the same to the inhabitants of the West Indies. Captain Bligh had the satisfaction, before he quitted Jamaica, of seeing the trees which he had brought with so much success, in a most flourishing state; inferring that no doubt remained of their growing well and speedily producing fruit; an opinion which subsequent reports have confirmed. But though the fruit has been produced in great abundance, it is said not yet to have arrived at that high state of perfection in which it is described to be at Otaheite. Thunberg sent seeds of the East Indian bread-fruit tree from Batavia to
to the botanic garden at Amsterdam, in 1775. In 1777, he sent some small living plants; and the year following, he brought with him to Europe a great number of plants, both of this and the following species. But the trueMED fort, from the South Seas, was first introduced into the islands of St. Vincent and Jamaica, and into the botanic garden at Kew, by Captain Bighi, in 1793.

The bread-fruit, when perfectly ripe, is pulpy, sweetish, putrefactive, and in this state is thought to be too laxative; but when green it is farinaceous, and esteemed a very wholesome food, either baked under the coals, or roasted over them. The taffe is not unlike that of wheaten bread, but with some resemblance to that of Jerusalem artichokes or potatoes. It was mentioned before that a fort of cloth was made of the inner bark; to this we may add, that the wood is used in building boats and houses; the male catkins serve for tinder; the leaves for wrapping their food in, and for wiping their hands instead of towels; and the juice for making bird line, and as a cement for filling up the cracks of their vessels for holding water. Three trees are tapped to yield sufficient nourishment for one person. In Malabar the fruit of the bread-fruit is called feron, in Java fousa, in Ambinna fana or fom, in Macassar bakar, in Ternate goma, in Ternan rima; the Dutch call it jerkfruit, the Germans brodbaum, the French rima ou fruit à pain.

2. L. interjectifolia, Indian jaca tree; "leaves entire;" foidiacum macroporum, Thunb. Phil. Trans. v. 69. p. 254. Sittochum eufilium, Gaurt. fuct. t. 345. Sarcocarpus nana, Rumph. Amb. t. 1. p. 30–31. Tjaseca-maram, f. Jacca, Rheed. Mal. 3. t. 26, 27, 28. The East Indian Jacca, or jock-tree, is about the same size as the foregoing, or perhaps larger. Branches alternate, spreading; the twigs hirtute with long fliif hairs; leaves alternate, pelted, ovate-oblong, blunt, obscurely serrate, undivided, armed, bright-green, and very smooth on the upper surface, paler beneath, and hirtute with very fliif hairs, spreading, a fpan in length. The younger leaves are evidently toothed, but the tooth disappear. The foot flak is somewhat triangular, smooth, an inch in length; flipples as in the foregoing; flowers male and female distinct on the fame ftree or branch; peduncle either simple or branched, pubifitous an inch thick, and a fop long; pedicle's three, five, or more, the length and thicknefs of a finger. The fruit weighs thirty pounds and upwards; it has within it frequently from two to three hundred seeds, three or four times as big as almonds; they are ovate-oblong, blunt at one end, fparm at the other, and a little flattened on the fides. These two fpecies of aracarpus cannot be diftinguifhed with certainty either by the form of the leaves, or the fition of the fruit; for the leaves in this are sometimes lobed as on that; and the fition of the fruit varies with the age of this tree, being firt borne on the branches and then on the trunk, and finally on the roots. The Jacca tree is a native of Malabar and the other parts of the East India. The fruit is ripe in December, and is then eaten, but is efteemed difficult of digestion; the marpe fruit is also used pickled, or cut into pieces and boiled, or fried in palm-oil. The nuts are eaten roasted, and the skin which immediately covers them, is used instead of the areca nut in chewing betel. The wood of the tree serves for building. No lefs than thirty varieties of the fruit are enumerated in Malabar. It was introduced into the royal botanic garden at Kew, in 1778, by Sir Edward Hughes knight of the bath. Propagation and Culture. Thofe varieties which bear seeds may be propagated by them, fown in a pot of rich earth, and plunged in the bark-bed. Thofe which have no feed in the fruit may be increafed by fuckers, in which they abound very much, or by layers. In hot climates they fucceed bett in a rich foil; for though they will grow in an indifferent one, yet they by no means arrive at that magnitude, nor is the fruit fo well flavoured as when they are planted in a good one. In the East Indies they thrift a fruit of the Jacca into the ground whole, and when the numerous seeds germinate and grow up, they tie the ftrems altogether with withes, and by degrees they form one ftem, which will bear fruit in fix or seven years if not placed in too wet a situation. See Martyn’s Miller’s Dict.

ARDOIS, in Geography, a province of France before the revolution, is one of the moft fertile and moft productive of grain and fruit in the whole kingdom. It was formerly one of the seventeen provinces of the Netherlands; but since the revolution it is principally included in the department of pas de Calais, or trait of Calais. The chief city is Arras.

This province is about twenty-three leagues long, and twelve broad; and is bounded on the west and south by Picardy, on the north-east by Flanders, and on the east by Havannah and Cambresis. The name of Artois is derived from the Atrebatii, who occupied this part of Gallia Belgica in the time of Caesar. From the dominion of the Romans it fell to that of the French kings, who possessed it in 863; in 1233 it was ceded to a Comité by St. Louis, and given to his younger brother Robert I. It was surrendere by Charles VIII. the fon and successor of Louis XI. to Maximilian of Austria, by the treaty of Senlis, in 1493. The books of Anhria and of Spain posseffed it in feuclifion till the year 1643, when Louis the XIII. obtained it by conquest from Philip IV. king of Spain; and from his time it has been subject to France. The peace of the Pyrenees, in 1659, secured it to him, with the exception of the towns of Aire and St. Omer, which, together with their respective territories, were referred to Spain; but afterwards ceded to Louis XIV. in 1678, by the treaty of Nimeguen, confirmed by subsequent treaties, and particularly by that of Utrecht in 1713. Its commerce confines principally in grain, flas, hops, wool, and linen cloth.

ARTOLICA, in Ancient Geography, a town of the Sabellini, in Gallia Cispadana, at the foot of the Alps, now called la Taille by the inhabitants, a hamlet of Savoy, in the duchy of Aouit, at the foot of mount St. Bernard the Lefs.

ARTOMELI, from αρτως, bread, and μέλι, honey, in Ancient Pharmacy, a kind of cataplasm prepared of bread and honey, applied chiefly to the preeordia.

ARTON, in Geography, a town of France, in the department of the Lower Loire, and chief place of a canton in the district of Parthenay, seventeen miles south-west of Nantes.

ARTONNE, a town of France, in the department of Puy de Dome, and chief place of a canton in the district of Riom, five leagues north of Clermont, and two and a half north of Riom.

ARTOTYRITES, or ARTOTYRITE, in Ecceiological History, a branch of the ancient Montanism, who first appeared in the second century, chiefly in Galatia. They use bread and cheese in the Eucharist, or perhaps bread baked with cheese. Their reason was, that the first men offered to God not only the fruits of the earth but of their flocks too.

Hence, according to St. Augustine, came their name, which is composed of αρτως, bread, and μελις, cheese.

The Artotyrites admitted women to the priesthood and episcopacy; and Epiphanius says, that it was common to fee seven girls enter at once into their church, in white robes with torches in their hand, where they bewailed with tears the miseries of human life.

ARTO,
ARTRO, in Geography, a river of North Wales, which runs into the sea near Llandder in Merionethshire.

ARUTUNI, Gio. Maria, of Bologna, in Biography, though he is ranked only among the minor writers on music, yet if his merit and importance are estimated by the celebrity and size of his volumes, certainly deferved the attention of students and collectors of musical tracts. In his "Arte del Contrapunto ridotta in tavole," published at Venice, 1586, he has admirably analysed and compred the voluminuous and diffused works of Zarlino and other anterior writers on musical composition, into a compendium, in a manner almost as clear and geometrical as that in which M. d'Alembert has abridged the theoretical works of Rameau. In 1589, Artuñi, who, like most of the musical writers of Italy, was an ecclesiastic, published a second part of his "Arte del Contrapunto," which is a useful and excellent supplement to his former compendium. And in 1600 and 1605, this intelligent writer published at Venice the first and second part of another work, "Delle imperfetioni della moderna musica." Here the author gives a curious account of the flatte of instrumental music in his time; and in describing a grand concert that was made by the means of a convent at Ferrara, in 1598, on occasion of a double wedding between Philip III. king of Spain with Margaret of Austria, and the archduke Albert with the infant Isabella, the king's sister, he enumerates the several instruments that were employed, and points out their excellencies and defects. Among these, though the violin is just mentioned, yet nothing is laid of its properties, while the cornet, trumpet, viol, double-harp, lute, flute, and harpichord, are honoured with particular remarks, both on their construction and use: but among these, the cornet, which has been supplanted in the favour of the public by the hautbois, seems to have lost the highest in the author's estimation. The elder Doni, in his dialogue written about fifty years before, mentions the cornet more frequently than any other instrument: "Il divino Antonio, da cornetto perfezionato—et M. Battaila dal Fondo, con il suo cornetto anchora; che lo fua miracoloso:" 

I have not been able, says Dr. Burney, to discover what instrument is to be understood in this dialogue, when Girolamo Parabosco says, "Io finonerò il trombone," and when it is said, "M. Gio Vaniacapo Buzzino fuanando di violone il fopranco, corre egli fa miracolosamente." I am utterly unable to guess what instrument is meant, unless we call violone, by a typographical error, has been printed for violino. But to return to Artuñi's remarks upon instruments; his hero on the cornet was Girolamo da Udine. In speaking of defects in the intonations of different instruments, I expected the violin would be celebrated for its superior perfection in that particular; but by the author's silence on that subject, I am convinced that it was either then or little used in concert, or was very ill played. Burney's Hist. Mus. vol. iii. p. 174.

ARTYMNESUS, in Ancient Geography, a town of Asia, in Lydia, where the Xanthians are said to have established a colony.

ARTZ, in Geography, a district of the island of Zealand, belonging to Denmark, in the prefecture of Kielhoduburg, which includes nine churches.

ARZTBACH, a river of Germany, which runs into the Ems, four miles south of Reiffeling, in the district of Storia.

ARZTBURG, a town of Germany, in the archduchy of Austria, near the Ems, twelve miles south-east of Steyr.

ARZTFELDT, a town of France, in the department of the Forts, and chief-place of a canton in the district of Bittbourg. The place contains 503, and the canton 6053 inhabitants; the territory comprehends 3224 kilometres and 12 communes.

Vol. III.

ARU, or Arroe, a small island in the Indian sea, between the island of Sumatra and the peninsula of Malacca.

ARVA, in Ichthyology, a name by which the Russians distinguish a species of mackerel found in the seas about Kamtchatka; the natives call it kara.

ARUA, in Ancient Geography, a town of Spain, in the district of Huelva, now Aleas, a citadel of Andalusia on the Betsis or Quadalequiver, seven leagues above Seville.

ARVA, in Geography, a town and castle of Hungary, the capital of a county which extends to Poland, between the frontiers of Siléfia and mount Crapack, fourteen miles north of Rosenberg.—Alfo, a river of Hungary, which runs into the Waag, eleven miles north of Arva.

ARVAD, in Ancient Geography. See Arad.

ARVALES FRATRES, in Roman Antiquity, were priests in ancient Rome, who afflicted in the sacrifices of the An- barvaluus, offered every year to Ceres and Bacchus for the prosperity of the principal fruits of the earth, viz. the corn and wine.

They were instituted by Romulus, and were twelve in number; all of them persons of the first distinction; the founder himself having been of the body. They constituted a college called collegium fratrum arvalium.

The mark of their dignity was a garland, composed of ears of corn tied with a white ribband; this, Pliny says, was the first crown given at Rome.

According to Fulgentius, Acca Laurentia, Romulus's nurse, was the first founder of this order of priests: she, it seems, had twelve sons, who used to walk before her in procession to the sacrifice; one of whom dying, Romulus, in favour of his nurse, promised to take his place; and hence, says he, came this sacrifice, the number twelve, and the name of brother.—Pliny (lib. xvii. cap. 2.) seems to indicate the same thing, when he mentions that Romulus instituted priests of the fields, after the example of Acca Laurentia, his nurse.

ARUANUS, in Conchology, a species of the Muric genus, that inhabits New Guinea. It is a coarse and heavy shell, usually of a black or bluish colour, and encircled with rings; the aperture is angulated; the tail rather long; and more pointed. The specific character is thus defined: tall patulous; spire crowned with spines. Off. This is the buccinum aruanum of Rumphius.

ARVARI, in Ancient Geography, an ancient people of India, on this side of the Ganges.

ARVAS, a town of Asia in Hircania. Q. Curtius.

ARUBA, in Geography, one of the Little Antilles islands in the West Indies, subject to the Dutch; it lies near the coast of Terra Fima, fourteen leagues west of Curacao, is uninhabited, and produces little else besides corn and wood. N. lat. 12° 30'. W. long. 67° 35'.

ARUBA, a town of Peru, in the province of Mecran, near a cape of the same name in the Indian ocean, thirty leagues east of Mecran.

ARUBIUM, or ARUBIUN, a town of Lower Media, on the Danube.

ARUBO, a river on the coast of Guinea, west of Illequino gulf.

ARUBOTH, or ARABOTH, in Ancient Geography, a town or country of Palestine, in the tribe of Judea.

ARUCCI NOVUM, a town situated on the confines of Lusitania and Batica, place of the Antonian thirty miles from Pax Julia; now Moura, a small town of Portugal, near the confines of the Ardila and Guadalequiver.

ARUCCI Vetus, a small town of the Turdetani, in Batica; now Arco, a hamlet of Andalusia, on the confines of Portugal and Estremadura, on the river Gama, seven
seven leagues to the east of Aruci Novum. A mountain in its vicinity called Arucianus derives its name from it; now la Sierra d'Arceche.

ARUCIA, a town of Illyris, in the interior parts of Liburnia. Ptolemy, According to some, it is now Braga; but according to others, Otricaria, a citadel of Moralia. ARUDIS, a town of Asia, in Syria, situate on the east side of Samothrace. Ptolemy.

ARUDE, in Geography, a town of France, in the department of the Lower Pyrenees, and chief place of a canton in the district of Obron, 11 miles south of Pau. The place contains 1756 and the canton 10,656 inhabitants; the territory includes 266 kilometres and 12 communes.

ARVE, a sonorous and violent river of Savoy, which rises from the Alps, in the county of Faugny, and runs into the Rhone near Geneva.

ARVEDORUM MONTE in Ancient Geography, mountains of India, on this side of the Ganges. Ptolemy.

ARVENSIS, in Entomology, a species of Curculio described by Mill. Zool. Dan. It is grey, with three lines on the thorax; wing-cases rufous, and faintly suffixed. ARVENSIS, a species of Cicada found in Denmark. It is yellow; front, abdomen beneath and sides black. Mill. Gmel. &c.

ARVENSIS, a species of Phalera (Vestal. Linn.) The wings are brown, with a transverse yellow spot in the middle; margin brown. Gmel. Fab. &c.—Vestal brunnea of Wien. Schmetter. This insect is of the middle size, and the under side is brown; the larva is naked, brown and spotted with white; the lateral line is blunt; head black, with two white lines.

ARVENSIS, a species of Vespa that inhabits Europe. It has four yellow bands on the abdomen, the third of which is interrupted. Linn. Fa. Su. Scheff. &c.

ARVERNI, in Ancient Geography, a denomination given to one of the most powerful nations of Gaul, whose country, according to Strabo, was situated between the ocean, the Pyrenees, and the Rhine. They claimed affinity with the Romans, as the descendants of Antenor; to this purpose Lucan says of them,

"Arvernique aut lato se dierce frates
Sanguine ab Iliaco populi."

And Pliny says, that after their conquest by the Romans, their ancient liberty was preferred to them on account of their bravery. When Cæsar took possession of Gaul, it was divided into two factions, the Arverni, and the Éduini; and it is said, that the complaints preferred at Rome by the Éduini against the Arverni, were one of the causes which brought the arms of the Romans into Gaul, under the command of Fabius Maximus and Domitius Ahemenobus. According to Steph. Byz. they were one of the most war-like nations among the Celts. Their country was composed in Aquitania Prima, and their capital was "Augustomunum," now Clermont, in Auvergne. N. lat. 45° 42'. E. long. 3° 28'.

ARVERON, in Geography, a river which rises in a glacier of Montanvert, in the Alps, and runs into the Arve.

ARVICO, a town of Italy, in the kingdom of Naples, on the east coast of Calabria Ultra, four miles south of Stilo.

ARVICOLA, in Entomology, a species of Scarabaeus (Melolontha Fab.) found in Rilla, and greatly resembling S. horticola. The field of the head is reflected; body black and immaculate. Gmel. &c.—Osy. It is hairy; and the thorax is tazed with blue.

ARVIEUX, Laurent P't, in Biography, was born of a family of rank at Marcielles, in 1635, and accompanied a relation to Syracuse in 1653. In this place, and in other parts of Syria and Palestine, he refused 12 years, perfecting himself in the eastern languages, and extending his acquaintance with the history, manners, and politics of the Levant. Returning to France in 1665, he was denounced as an envoy to Turin in 1668, for the purpose of negotiating a treaty. Whilst he was successfully conducting this business, he procured the liberation of 380 French slaves who, upon being refused to their country offered him a purse of 600 pistoles, which he declined accepting. At Constantinople, whither he was sent in 1672, he obtained everything he asked; and surprized the Turks by holding all his conferences without an interpreter. He was afterwards, viz. in 1675, sent to Algiers, and obtained the freedom of 242 French slaves. In 1679, he was preferred to the consulate at Aleppo, where he performed various services, which recommended him so much to Pope Innocent XI. that he sent him a brief for the bishopric of Babylon, empowering him to appoint another person if he himself chose to decline it. Accordingly he nominated father Pidon to the office. In 1686, he returned to Marcielles, and principally devoted himself to literary pursuits. He wrote several memoirs on Modern History, and the affairs of the Levant; and he employed the last years of his life in the study of the scriptures in their original languages, aided by the assistance and patronage of the learned and pious. He died in 1702, aged 67. In 1717, M. de la Rocque printed, in 12mo., a MS. which he had left unfinished, containing an account of a journey to the grand emir of the Arabs, with a description of the manners and customs of that people; and in 1734 there appeared, "Memoires de l'chevalier D'Arvieux," with an account of all his travels, &c. in 6 vols. 12mo. collected and arranged by father Labat, a Dominican. Moseri. Gen. Bio. r.

ARVILL, in Ancient Geography, a people of Gallia Lycennis, mentioned by Ptolemy, who are supposed, by M. d'Anville, to have occupied that part of Gaul which corresponds to part of Maine. Some vestiges of their ancient capital have been discovered in La Cise, on the river Erve, which runs into the Sarte.

ARVILLE-Suppères, an entertainment made at funerals in the northern parts of England; and arvel-bread is the bread delivered to the poor on such occasions. Arvil has also been held for the funeral rites themselves.

ARVIRAGUS, in Biography, a British king, flourished, according to Geoffrey of Monmouth, and other native writers, in the time of the emperor Claudius. Geoffrey's account of his reign is generally deemed fabulous; however, he says, that he was the son of Romæus; that upon the death of his father and brother, he headed the Britons, and gained a victory over Claudius; that upon Claudius's return to Rome, he became a powerful prince, and assumed independent authority; that upon the arrival of Vespasian, he made a compromise with him, and retained his dominions; and that, having governed the kingdom in peace, his life was protracted to a good old age; that he was loved and feared even by the Romans; and that he was buried at Gloucester, in a temple he had built and dedicated to the honour of the emperor Claudius. An old tradition reports, that, in the time of this king, Joseph of Arimathea came over to Britain, and planted the gospel in this country. Bio. Brit.

simple, a little shorter than the spathé, coloured, banded at the bottom with ferrum, and shrivelling above them; perianth proper none. Cor. none; nectaries: thick at the base, ending in threads or tendrils, in two rows, issuing from the middle of the spadix. Stam. filamento none; each anther fertile, four-connate. Female flowers on the lower part of the spadix; close to each other, Col. spathé and spadix common to them with the males; perianth proper none. Cor. none. Fil. germ each obovate; style none; stigma beard-like. Pdr. berry globular, one-celled. Seeds several, roundish.

Eff. Gen. Char. spathe one-leaved, cowled; spadix naked above, female below, flaminous in the middle. Species:

* Without fruits; leaves compound.

1. *A. crinum*, hairy sheathed arum; "leaves pedate, with the lateral segments involute; spathé hairy within; spadix fomentaceous above;" root leaves cut into seven parts, which are lanceolate, nerved, middle part largest; the first leaves are pagitate, or five-awned, various; petals round, sheathing at bottom, scape very short, round; spathé as in the common arum; spadix subcylindrical, a little shorter than the spathé; club many times longer than the other parts, having remote violet-coloured bristles scattered over it. The flower smells strong like carrion, by which flies are enticed to enter, but when they would retreat, the revoluted hairs prevent them, and they are there devoured to death. It is a native of Minorca, and introduced in 1777, by Mr. Malcolm. It flowers in March. 2. *A. dracunculus*, long-sheathed arum or common dragon, "leaves pedate, leaflets lanceolate, entire; lamina ovate, longer than the spadix;" this has a large tuberous fibrous root, which in the spring puts up a straight stalk about three feet high, spotted like the belly of a horse; at the top it spreads out into leaves, which are cut into several narrow segments almost to the bottom; at the top of the stalk the flower is produced, which is in shape like the common arum, having a very long spathé, of a dark purple colour, flanging erect, with a large spadix of the same colour, so that when it is in flower, it makes no unpleasing appearance, but the flower has so strong a scent of carrion, that few persons can endure it. It is a native of the southern parts of Europe, flowering in June and July. Cultivated by Gerard in 1596. 3. *A. dracunculum*, short-sheathed arum, or green dragon, "leaves pedate, leaflets lanceolate, entire, longer than the spathé, which is shorter than the spadix;" it rises about eight or nine inches high; leaves petioled, upright, smaller than those of the common dragon; leaflets broad, lanceolate, commonly in threes; spadix awl-shaped, slender, longer than both spathé and leaves. It flowers with us in June, and grows in moist places in Virginia and New Jersey, also in Japan and China. Cultivated by Miller in 1759. 4. *A. senegala*, purple-flowered arum, "leaves pedate, leaflets suboval, entire, lamina lanceolate, longer than the spadix;" the native country of this species is not known. It flowers in March, and was introduced by Mr. Malcolm in 1774. 5. *A. feroxphyllum*, five-leaved arum; "leaves quintate;" it grows about a foot high, fimbriate, upright; leaflets lanceolate, entire, smooth. A native of the East Indies and China. 6. *A. trilobatum*, three-leaved green-fibrous arum; "leaves terete, lamina lanceolate, terminate, the length of the spadix; it is fimbriate, with the scape arising from the petiole; some scapes are male, others female, from the same root; the male spathé is erect, the female has the lip inflected. The Brazilian plant has the side leaflets lobed outwards. The Virginian plant has them only gibbous, but the situation of the flower is the same in both. This plant according to Linné differs in China from the foregoing, in having the leaflets denticulate, not pedate. It flowers in June and July, and appears from Evelyn's kalendar to have been cultivated here, in 1654. 7. *A. arborescens*, three-leaved purple-flowered arum. *A. trilobatum*, 8. *A. thrysiflorum*, 89. *Lin. Spec. "Leaves terete, lamina ovate, shorter by half than the spadix." A native of Virginia, and cultivated by Miller in 1759. Its flowers in June and July. 8. *A. terricum*, "leaves terete, receptacle longer than the spathé." Found in Japan by Thunberg, flowering in May and June.

** Without fruits; leaves simple.

9. *A. coloratus*, Egyptian arum, Cateto. con. 2. t. 45. "Leaves pedate, ovate, repand, semibarbatus at the base; it has a thick large oblong root, rounded at the base; leaves thick, smooth, un-coloured, in form and size resembling those of the water lily; petals thick, upright, roundish, white, spreading out at the bottom; scape short, with a tubulose reflex flat spathé. A native of the Levant, Egypt, Sicily, &c. This plant is esteemed a wholesome food. 10. *A. biococcus*, two-coloured arum, "leaves pedate, fimbriate, coloured on the disk, spathé contracted in the middle, fimbriate at the base, lamina roundish, acuminate; upright, somewhat convolute." This is cultivated in Madeira, and was introduced here in 1773, by Moll. Kennedy and Lee. It flowers in June and July. 11. *A. euculatum*, eculeate arum, or Indian kale. Shakes. Jan. 1. t. 1756. "Leaves pedate, ovate, entire, emarginate at the base; it has large, tuberous, tubulous, brown, with small tubers growing at the side of it. The plant is about three feet in height; leaves smooth, of a bright green, semibarbatus at the base, and roundish; petals round, dilated at the base, embracing the inner ones; spathe spreading, straight, not cowled, longer than the spadix. The Jamaica plant seems to be smaller than that of the east; for Shaw says that it only rises a foot from the ground. He says, that island this species is planted very carefully in moist plantations; that the roots are eaten, but that the leaves are most valued, which are boiled and used as coleworts. It would seem indeed that the *A. euculatum* is a plant highly useful and very generally cultivated in warm climates, and by none more than by the natives of the South Sea Islands. The acrimony of the root in its recent state is fo great, that when eaten raw, it will excoriate the mouth, but on being baked, this acrimony quality is wholly diffusible. 12. *A. macrocarpus*, long-rooted arum. Flor. Austr. 8. t. 429. "Leaves pedate, cordate, repand, two-parted at the base; it has this very large root, or rather tuberous trunk, the thickness and length of the human arm; leaves very large and wide, fimbriated on both sides, furnished with strong prominent nerves; their very long hollowed petioles form at bottom, where they embrace each other closely; stem three feet long, and as thick as a man's arm. The flower is white and very sweet; all the florets are hermaphrodite. This species, which is distinguished by its great size, is a native of China, and Cochinchina, the East Indies, Ceylon, and the islands of the Southern Ocean, and is eaten by the natives like the foregoing. 13. *A. pergeratum*, "Leaves cordate, obtuse, mucronate; angles rounded." A native of America. Mr. Miller says that he has received three sorts of arum from the West Indies, by the title of Edder, but he supposes this to be most commonly cultivated there for its roots. 14. *A. divortium*, "Leaves cordate-bifid, dissimilis." Rhed. Mal. 11. 39. t. 20. Spathe revolutus; spadix fimbriate, longer than the spathé. A native of Malabar and Ceylon. 15. *A. trilobatum*, three-leaved arum. Mill. fig. t. 52. f. 2. "Leaves fimbriate-trilobate; flower fertile." Miller describes this plant as follow: root tuberous; leaves remaining most part of the year; spathe five inches long, inclining downwards, having a long point twisted like a screw, inside.
A R U M.

fide deep purple, outside green; spadix long, slender, purple; extending out of the spathhe, turning upwards; the flower is fded like a carnation. It was brought from Ceylon in 1752, and flowered in the Chelsea garden. It flowers here in May and June. 16. A. fagittatum, arrow-leaved arum. Jacq. Hort. 2. 157. Ceci also Brown Jam. and Sloane's Hort. 2. 106. 8. 3. Lour. Coch. 574. "Leaves fagittate triangular; the angles divaricate, acute;" upright, four feet high; leaves large, dusky green, bifid at the base, divaricate, all the angles acute; footstalks round, spotted with red and black; spathe long, cowled, longer than the spadix, which is club-shaped. A native of the Spanish West Indies, Chindia, and Cochinchina. Cultivated by Miller in 1731. In Jamaica it is called smaller Indian kale, and cultivated there by several persons for the same purposes as the A. efculentum. 17. A. maculatum, common arum, Curt. Lond. 2. 63. Woolv. 3. 25. Smith Flor. Brit. Hudf. Wither. Lightf. A common arum without spots. 8 Common spotted arum. 7 Italian arum. "Leaves habitate, entire; spadix club-shaped." It has a tuberous whitish root about the size of a large nutmeg, growing twinerly, fending forth on every side a great number of fingle filices, propagating itself by lateral tubercles; leaves radical, from two to four, fliming, veiny, frequently marked with dark purple, or black spots, sometimes broken with white, fanding on fleething triangular footstalks; fpathe ufually green, and often fotted like the leaves; fpathe varies from a yellowish green, to a fine purple; berries fcarlet, in a naked clufher, containing one or two feeds. It is common in most parts of Europe, and is the only species of the genus indigenous in Britain. It is ufually fuded under heedges, flowering in May, and ripening its berries in the autum. 18. A. virginicum, Virginian arum. "Leaves habflate-cordate, acute; angles obtufe." It grows wild in wet places in Virginia, Carolina, Pennsylvania, &c. The favages boil the fpathe with the berries, and devour it as a great dainty. 19. A. probofideum, Apenine arum, arilium, Tournef. Bocc. Muff. 2. 61. t. 50. "Leaves hablate, fpathe decinate, filiform-fimbolute." A native of the Apenines. Spathe shaped like a monk's cowl; leaves on very short footstalks. 20. A. ariforum, broad-leaved hooped arum, or friar's cowl. Hort. Cliff. 435. t. 79. "Leaves cordate oblong, aperture of the spathe ovate; spathe entire and bent forwards above, below not convolute;" about a foot and a half high; leaves sharphift; spathe shorter than the leaves; spadix curved; berries red, one-fedded. A native of the South of Europe. Dr. Smith obferves, that the Italians call this plant il fume, from the flickering reffemblance of its flower, when reverfed, to a lamp with itswick. Cultivated by Gerard in 1596. 21. A. fiiatum, painted arum. "Leaves cordate, painted with coloured veins;" root-leaves three or four, petioled, painted on the upper surface with white veins; fpathe fcelar, radical, inflated at the base, green, except at the top, where it is purplish; fpathe with an ovate-oblong, dark purple club; germshubglobule, green; anders immediately above them; upper filaments remote. See Supp. Plant. 410. 22. A. ovatum, Rumph. Amb. 5. 312. t. 108. "Leaves ovate-oblong; spathe feabrolous." A native of the East Indies. 23. A. tenfifolium, grafs-leaved arum, or narrow-leaved friar's cowl. "Leaves lanceolate; fpathe brillifh-shaped, decinate." This species ufually has five or fix fhiming leaves resembfmg thofe of narrow-leaved plantain; fpathe long, foid tef, reflex, white; fpathe seven inches long, purple or green-hifted, pointed. It grows wild about Rome, Montpellier, also in Dalmatia and the Levant. We learn from Lobel that it was cultivated here in 1570. 24. A. canefifolium, Supp. Plant. 470. "Leaves lanceolate, veinefhs;" leaves few, two feet long, resembfng thofe of canna; feave very fhort; fpathe rather obtufe, red without, white within. In the fpadix there is no space between the lamens and piffils. A native of Surinam, on trees, paftifhal.

*** Cauliflora.***

25. A. arborifem, tree-arum, Plum. Amer. 44. t. 51. 55. & 62. "Straight; leaves fagittate." A native of South America. 26. A. fignum, dumb caule arum, Jacq. Amer. 239. t. 151. pict. t. 229. Miller's fig. 295. See Sloane and Brown's Jam. "Nearly upright; leaves lanceolate ovate." It rifes to the height of fix or seven feet, with a green-jointed flalk, as large as a walking-cane. Leaves placed irregularly at the top of the flalks in a clufher; they are oblong, of a light green colour, and sometimes punched with holes, as in the deaconium pertum. On the side of the flalks, between the leaves, the flowers appear with a long fpathe of a pale green colour, marked with white spots. The female flowers and lamens are ranged only on one side of the fpathe, a circumstance which distinguishes it from all its conge- ners. It is a native of the Sugar Islands, and the warmer parts of America. Cultivated in 1759, by Miller. The whole plant abounds with an acute juice, so that if applied to the tongue, this organ swells to much as to lofe the power of articulation, and hence the name of dum-cane. In this way it is said to have been used as a punishment for negroes. The juice is sometimes employed to affift the lime in promoting the granulation of fugar. 27. A. hederaeacm, ivory-leaved arum, Jacq. Amer. t. 152. pict. 230. "Radicant; leaves cordate, oblong, acuminate; petioles round." A native of the West Indies. 28. A. tubulatum, tongue-leaved arum, Brown Jam. 333. n. 12. Sloane's Jam. 1. 75. t. 27. f. 2, 3. "Creeping; leaves coruate lanceolate; their footstalks edged with membranes." It readily climbs trees, and becomes more succulent and luxuriant towards the top. A native of the West Indies. 29. A. auritum, ear-leaved arum, Brown Jam. 331. n. 2. Sloan. t. 169. "Radicant; leaves terete; fhole on the fide one-lobed." A climbing plant, fending out roots from the ftems and branches; leaves large heart-shaped, having three lobes or ears; flowers inclosed in a large fpathe. A native of the West Indies. Found on all the hills of Jamaica, climbing the trees, and is the only species of the genus with compound leaves in that ifland. Cultivated by Miller in 1748. 30. A. indicum, Indian arum, Lorr. Coch. 536. Rumph. Amb. 5. t. 106. "Nearly upright; leaves ovate; bifid at the base, rounded; fpathe axillary;" ftem five feet high, as thick as a man's arm; leaves very large, with many tranfvere parallel ribs, on fimbolute, erec, flem- clapping footstalks; fpathe axillary, small, acute, rightfht, convolute; fpathe tapering, erec; berries pale, small. A native of the East Indies. Cultivated in Cochinchina, where the flalk is boiled and eaten. 31. A. cuculatum, cowled arum, Lorr. Cochinch. 356. "Upright; leaves petiuate, cordate, with the ears cowled;" ftem two feet high, leaves acuminate, on round footstalks; fpathe short, almoft wholly covered with fores. A native of the fuburbs of Canton. 32. A. fipite, fiprum arum, Retz. Obs. 1. 30. n. 104. "Stemlefs; leaves lanceolate; fpathe fcelar fheifie;" leaves acute, naked, with the footstalks dilated at the base, membraneous, veined. A native of Tranquebar in the East Indies, discovered by Koenig. This fpecies ought to have been placed in the second division. It may here be obferved, that in the arum, every piffil and every anther is to be confidered as a diftinct floret, consequently it ought to be removed to the clafs monoea; and this has been done by Screber and Withering. Thunberg and Swartz place it in the clafs polypodium. We fee no advantage however in removing it from the clafs gymnadenia, where it was left by the great author of the sexual fystem.

Medical
ARU

**Medicinal qualities.** Common arum is the only species of this genus included in the Materia Medica; and its use is confined to the root, which in a recent state is inedible and extremely aconiacious, infomuch that when cut into slices and applied to the skin, it has been found to blister the part; and upon being chewed, it excites an intolerable sensation of burning and prickling in the tongue, which continues for several hours. This acrimony, however, is gradually lost by drying, and may be, to completely dissipated by the application of heat, as to leave the root a bland carminative aliment. Its medicinal efficacy, therefore, resides wholly in the active volatile matter. It is a very powerful stimulant, and by promoting the secretions, may be properly employed in cachetic and chlorotic cases, in rheumatic affections, and in various complaints of phlegmatic, torpid consti- tutions; but more especially in a weakened or relaxed state of the stomach, abounding with vifid inmucus. If the root is given in powder, great care should be taken that it be young and newly dried, when it may be used in the dose of a scruple or more twice a day; but in rheumatic and paralytic affections, requiring the full effects of this medicine, the root should be given in its recent state; and to cover the inportant puipuency it discovers on the tongue, Dr. Lewis advises us to administer it in the form of emulsion with gum arabic and spermacaet, increasing the dose from ten grains to upwards of a scruple, three or four times a day; in this way, he says, it generally occasioned a perspiration of light sweat; the stomach, and afterwards in the more remote parts, manifetely promoted perspiration, and frequently produced a plentiful sweat. As several obstinate rheumatic pains were removed by this medicine, it is recommended to further trial. See Wood. Med. Bot. p. 75.

**Propagation and Culture.** Species 2. is very hardy and will grow in any soil or situation; autumn is the proper time for transplanting it. 3. should have a moist, sandy situation; it is with difficulty preferred in gardens. 6, 7, 8, are propagated by offsets; they will live in the open air, if planted in a sheltered situation, or if the ground be covered with tan. 9, 10, 11, 12, 13, 14, and 16, are to be propagated by offsets planted in pots, and plucked into a hot-bed, and after having acquired sufficient strength, kept upon shelves in a dry flor. 15, requires the tan-bed or bark-flor. Common arum ought to be transplanted soon after the seeds are ripe. 19, 20, 21. These multiply by offsets, and should have a sandy situation. 25, 26, 27, 28, 29, are propagated by cutting off the flanks, into lengths of three or four joints, which must be laid to dry fix weeks or more; for if the wound part be not perfectly healed over before the cuttings are planted, they will rot and decay; they should be put in small pots filled with light sandy earth, and plunged into a moderate hot-bed of tan, being careful that they have little wet till they have made good roots, when some of them may be placed in a dry flor, and others plunged in the tan-bed, in the bark flor, where they will produce more flowers. They are tender plants, and must be constantly kept in the flor. See Martyn's Miller's Dict.

**ARUM Ethiopianum.** See CALLA.

**ARUM Scandens.** See Dracaenum.

**ARUMATIA, in Entomology, a name given by Mark-gra ve, in his Natural History of Brasil, to the species of Mantid called Gipas by Linnaeus.**

**ARUN, in Ancient Geog'raphy, a village of Paleflne, in the neighbourhood of Samaria.**

**ARUN, in Geography, a river of England, which runs into the sea at Little Hampton in Suffors, famous for its red mullets.**

*ARUNCI. See ARUNCI.*

**ARUNCI, in Entomology, a species of Cicada, described by Scopoli. This insect is entirely of a ferruginous colour, with brown eyes.**

**ARUNCO, in Zoology, a species of Rana toad, that is larger than the common frog, but nearly of the same colour. It inhabits Chili; and is described by Molina. All kinds of this kind are palmated, and the body warty. Dr. Shaw specifically describes it thus: R. corpore verrucose pedibus omnibus palmatis. Gmelin seems to think the palmed feet are a sufficient criterion by which it may be distinguished, "pedibus omnibus palmatis." Gmelin.**

**ARUNCUS, in Botany. See SPIREA.**

**ARUNDA, in Ancient Geography, a town of Spain, in Baecca, seated on the Annas or Guadiana; now said to be Roadas, in the province of Granada, on the confines of Andalusia. N. lat. 30° 26'. W. long. 6° 40'.**

**ARUNDEL, Thomas, in Biography, archbishop of Canterbury in the reigns of Richard II., Henry IV., and Henry V., was the second son of Robert Fitz-Alan, earl of Arundel and Warren; and at the age of twenty-one years, in 1374, promoted from the archdeaconry of Tamton to the see of Ely, and enthroned with the ulual solemnities in 1376. While he held this see he almost rebuilt the episcopal palace in Holborn, and, beside other donations, presented it with a table of massive gold, enriched with precious flowers, which he had bought of Prince Edward for three hundred marks. Upon his translation to the arch- bishopric of York, in 1388, he expended a large sum in building an archiepiscopal palace, and in furnishing the church with several pieces of silver-gilt plate, and other ornaments. After his advancement to the see of Canterbury, in 1396, he was a great benefactor to that church; for he built the southern tower and great part of the nave, and gave it a ring of five bells, called "Arundel's ring," several rich veiments, a mitre enchaufed with jewels, a silver girt croiser, a golden chalice for the high altar, and another to be used only on St. Thomas a Beckett's day. He held the office of lord high chancellor of England, with some interruptions, from the year 1386 to 1399; and in 1393, he removed the courts of justice from London to York; partly with a view of mortifying the pride and influence of the inhabitants of London, and principally for the purpose of en- riching those of the latter city, over the diocese of which he presided: but after the experience of one or two terms, the courts returned to their first and more convenient station. Soon after his accession to the metropolitan see, he revived an old institution, by which the inhabitants of the several parishes of London were obliged to pay their rector one halfpenny in the pound out of the rest of their houses.

The interference of archbishop Arundel in the civil affairs of the kingdom terminated in his impeachment and exile. Having taken an active part in the first attempt that was made to deliver the nation from the oppression of Richard II., by obtaining a commission to the duke of Gloucester, his brother the earl of Arundel, and others, in which com- mission he himself was included, for governing the kingdom, he was impeached by the commons, sentenced to be banished, and ordered to leave the kingdom within forty days, on pain of death. Pope Boniface IX. feizing this opportunity of tetifying his displeasure against the king and parliament of England, gave Arundel a cordial reception at Rome, nominated him archbishop of St. Andrews, and promised him other preferments. The king's remonstrance, however, prevailed with his holiness to withhold the grant of the further favours which he had intended to confer on the exiled prelate. The dissatisfaction of the people of England with the
the government of Richard II., increasing, archbishop Arundel had an opportunity of returning to his country, and regaining his dignities. Whiles he was in Brittany, in his way home, he was employed to fetch Henry duke of Lancaster, who had been banished by Richard, to return from France, and assume the crown: and having obtined the duke's scruples, the accession of Henry IV. was accompanied with the restoration of Arundel to the metropolitan see; and he had the pleasure of placing the crown on the head of his new master. At an early period of this reign, a deign was formed of feizing the revenues of the church, in order to supply the exigencies of the public service. In a parliament held at Coventry in 1424 or 1425, and called "Parliamentum Indoctum," this measure was proposed for execution. Arundel was present, remonstrated against the proposal, and urged that the clergy were at least as serviceable to the king by their prayers, as the laity by their arms; and that the kingdom could not expect to prosper as long as the prayers of the church were destitute. His spirited exertions prevented, for the present, the further prosecution of this violent measure. The archbishop having thus restored the temporalities of the church from depredation, manifested equal zeal in preserving inviolate its internal constitution. He exerted himself for restraining the progress of those new opinions, with regard both to doctrine and worship, which were disseminated by the Lollards or Wickliffites; and as the sway of Oxford was beginning to be infected with these opinions, he appointed visitors to examine and to report the state of that seminary. He proceeded, in consequence of the information he received from the inquisitorial committee, delegated and authorized by his authority, to persecute, with as much severity as any other thing nothing but the ignorance and bigotry of the times can in any degree justify, those who were found chargeable with this new heresy. Upon the authority of the act for burning heretics, which passed in the reign of Henry IV., and which remained for a long time a support to our statute books, a Lollard was condemned to the flames in 1410; and in the beginning of the reign of Henry V. Sir John Oldcastle, lord Cobham, a principal patron of the Lollards, was indicted by the priory, convicted of heresy, and sentenced to the flames. He had some time before attempted to procure an order from the pope to dig up the bones of Wickliffe, which was refused; and he actually procured a fysiological constitution, which prohibited the translation of the scriptures into the vulgar tongue. It is said that whilst the archbishop was pronouncing sentence of excommunication and condemnation on lord Cobham, he was seized with an inflammation in his throat, which prevented his taking any further part, and soon terminated in his death, Feb. 28th, 1413. The death of the prelate, as to the time and manner of it, was attributed by the Lollards to the immediate interposition of God; but however superstitious such judgments may be deemed in the present enlightened age, the intolerance and cruelty of the archbishop will be universally condemned, and they will entitle him reproach on his name and character as long as any records of him remain. Boc. Brit.

Arundel, in Geography, a corporation and borough town of England, in the county of Sussex, seated on the river Arun, where its name. It sends two members to parliament; the corporation consists of a mayor and twelve burgesses; it has two markets weekly, on Wednesday and Saturday; and is distant from London sixty-one miles. It has a harbour which admits vessels of one hundred tons burthen, and which was repaired in 1733. The caffle, which stands on the north-east part of the town, was erected by the empress Matilda on William the Albane, as a recompence for his defence of it against King Stephen. It descended to the Norfolk family in 1579, and the present duke has expended large sums in repairing and adorning it. To this place belongs the peculiar privilege of conferring the title of earl on itsCollector without any patent or creation from the crown; and Arundel is the premier caledon in England. N. lat. 50° 45', W. long. 2° 27'.

Arundel, a township, in York county and district of Maine, situate between cape Porpoise and Biddeford on the north-east, on the river Saco, twenty-one miles north-east from York, and ninety-six north-east from Boston. It contains 1438 inhabitants.

Arundelian Marbles, Marmora Arundelliana, or Oxford Marbles, called also Parian Chronicles, are supposed to be ancient marbles, wherein is inscribed a chronicle of the city of Athens, engraved in capital letters in the island of Paros, one of the Cyclades, 264 years before Jesus Christ. They take their name from Thomas earl of Arundel, who procured them out of the East, or from Henry his grandson, who presented them to the university of Oxford.

These marbles, and other ancient relics, were purchased in Asia Minor, Greece, and the islands of the Archipelago, by Mr. William Petty, who was employed, in the year 1624, by Thomas earl of Arundel, in making such collection for him in the East. They were brought into England about the year 1627, and placed in the gardens belonging to Arundel house in London. Soon after their arrival, they excited very general curiosity among inquisitive and learned persons; and Sir Robert Cotton engaged Mr. Selden to explain the Greek inscriptions. Accordingly Selden and two of his friends, Patrick Young, or Patricks, John, and Richard James, immediately undertook the business; and in the following year Selden published a small volume in 4to, under the title of "Marmora Arundelliana," containing about thirty-nine of the inscriptions, with annotations. During the civil wars, Arundel house was often defaced by its illustrious proprietors, and some of the marbles were defaced or broken, and others stolen or used for the ordinary purposes of architecture. The chronological marble, in particular, was broken and defaced; and the upper part, containing thirty-one epochs, is said to have been used in repairing a chimney in Arundel house. In the year 1667, the honourable Henry Howard, afterwards duke of Norfolk, the grandson of the first collector, preserved these curious remains of antiquity to the university of Oxford; and as Mr. Selden's work was become scarce, bishop Fell engaged Dr. Prideaux, dean of Norwich, to publish a new edition of the inscription, which was printed at Oxford in 1676, with additional notes and translations, under the title of "Marmora Oxoniensia, or Arundelianis, Seldenianus, et alia confissa." In 1731, Mr. Matraire favoured the public with a more comprehensive view of these marbles than either of his predecessors; and in 1763, Dr. Chandler published a new and improved copy of them, in which he corrected the mistakes of the former editors, and supplied the lacuna in some of the inscriptions, particularly those of the Parian chronicle, by many ingenious conjectures.

These marbles, in their perfect state, contained a chronological detail of the principal events of Greece during a period of 1318 years, extending from the commencement of the reign of Cecrops in the year before Christ 1522, to the close of the archonate of Diognetus in the year before Christ 264. But the chronicle of the last 90 years is lost, so that the part now remaining terminates with the archonship of Dicthius, 354 years before Christ; and in this fragment the inscription
inscription is very much corroded and effaced, and the sentence can only be discovered by very learned and indistinct antiquaries, or supplied by their conjectures. For a translation from the Greek of this ancient remain, see Tab. 1. Playfair's Chronology, p. 297. Almost every event in this table between the destruction of Troy and the annual migration of Athens, is dated twenty-six years earlier than in the canons of Eusebius, and those of other approved chronologers; so that this number of years must be subtracted from the dates in the tables, during the time mentioned, in order to accommodate them to those of Eratosthenes, Dion, Halicarnassus, Eusebius, and other ancient writers.

These valuable remains of antiquity have been applied to the elucidation of many parts of ancient history that had been long involved in obscurity. However their inconsistency with other authentic historical accounts has depreciated their importance and use; and Sir Isaac Newton, as well as some other modern philosophers, have paid little or no regard to them. Their authenticity has indeed of late been the subject of particular discussion between Mr. Robertson, who, in his "Parian Chronicle," Svo. 1788, questioned it; and Mr. Hawlett, in his "Vindication of the Authenticity of the Parian Chronicle," Svo. 1789, defended it. See an account of the arguments on both sides, under the article Parian Chronicle.

ARUNDINACEA, in Conchology, a species of SABELLA found in rivers in some parts of Europe. It is fusiform, open at both ends, and composed of fragments of the bark of reeds placed on each other. Gmelin, &c.

ARUNDINACEAS, in Ornithology, a species of TURDUS that inhabits reedy marshes of Europe, and is called La Rouferole, or Roucherolle, by Buffon, Buffon, and other French writers. Ray and Willughby named it Junco, or greater reed sparrow; and Dr. Latham, the reed thrush.

This bird is rather larger than the common lark; the colour is ferruginous brown; white, with a tawny band beneath; quills-leathers brown, reddish at the end. Gmelin, &c. Of this species Gmelin enumerates three varieties; viz. g. Turdus arundinaceus supra fagittis nigris variis; var. varied above with black arrow-shaped spots. 2. Turdus arundinaceus minimus, supra ex integentibus virens, testacea abbas ferrugineus; var. small, above yellowish-green, wing ferrugineous. In the southern parts of Russia, and in Poland, this species, it is said, is very common. It makes its nest on the molly billocks among reeds and rushes, or according to Cramer suspends the nest between two or three reeds which are fastened together to support it. The female lays five or six eggs; and the male, it is likewise observed, is perpetually piping while the female is sitting; and hence it has acquired the name of water nightingale.

ARUNDINETI, in Entomology, a species of TIPULA deburred by Linnaeus and Fabricius. It is whitish; antennæ villosæ; eyes black. A native of Europe, and inhabits reedy marshes.

ARUNDINIS, a species of PHALANA (NOBEL, Linn.) that lives on the flanks of reeds. It is an European kind; the wings are cinereous with black dots, and marginal lunulae of the same colour; and the wings beneath marked with a central brown spot. Fabricius, &c.

ARUNDINIS, a species of APHIS, that lives on the leaves of arundo egyptiaca. The body is green; head and thorax brown, and covered with white dots. Fabricius, Gmelin, &c.

ARUNDO, in Botany, Reed (supposed to be derived from area, because it soon becomes dry). Linn. g. 93. Schroeder, 124. Julii. 32. Clas, triandra digynia. Nat. Ord. Gramineae or grasses. Gen. Char. Cal. glume one, or many-flowered, two-valved, erect; valves oblong, acuminate, awnless; one shorter. Cor. two-valved; valves the length of the calyx, oblong, acuminate; from the base arises a lance, almost the length of the flower; nectary, two-valved, very small. Stam. filaments three, capillary; anthers forked at both ends. Pyr. germ oblong; styles two, capillary, reflex, villosæ; stigma capitate. Pfr. none: corolla adheres to the seed without gaping; seed oblong, oblong, acuminate at both ends, furnished with long down (pappus) at the base. Eff. Gen. Char. Cal. two-valved; flowers congested, surrounded with wool.

Species, 1. A. bambus; bambu or bamboo-cane; A. Lambri, Lambri. Cochinich. 56. A. arbor. Bauh. Pin. 18. wafurisia, Bihla. Rumph. Amb. I. 6. c. 4. Ily. Rheed. Mal. i. 5. t. 16. Bambus arundinacea, Retzm. Obi. 5. 25. n. 58. "Calyces many flowered, (one-flowered, Linn.) spikes in threes, (unequal in number, Retz.) sepals," Lin. flowers fix-flaened; panicle diffused, with imbricate spikelets, branches of the culm spiny; calyces one-flowered. Loureiro. Panicle branched, divaricate, hard; spikes heaped alternately, unequal in number, sepalrio. Reitz. The bamboo has a woody hollow round bright culm, forty feet high and upwards, simple and thinning; the internodes a foot in length and in circumference; hearts thick, hairy, rough, convolute, deciduous; branches alternate, slender, ferial, spiny, reching, springing from the base to the top; the lower ones being usually cut off; leaves small, entire, lanceolate, roundish at the base, flat, round, on alternate round petioles. For the parts of inflorescence we refer to the specific characters. It grows almost every where within the tropical regions. Over a great part of Asia it is very common; in China, Cochinchina, Tonquin, Cambodia, Japan, Ceylon, the peninsula of India, and the islands. The bamboo-cane has been long since introduced into the West Indies, and foundries also in South Carolina. Mr. Miller cultivated it here in 1730, and if our flowers were high enough, these plants would probably rise to the height of forty feet, as a strong shoot from the root has been found to attain to half this height in five weeks.

There is perhaps no plant used for such a variety of purposes as bamboo. In the East Indies, great use is made of it in building, and the households of the lower classes of people are almost entirely composed of it. Bridges are also made of it, masts for their boats, boxes, cups, ladders, mats, &c. Paper is also made of it by boiling and steeping it in water, and thus forming it into a paste. It is the common fence for gardens and stoves, and is frequently used as pipes for conveying water. The leaves are generally put round the tea which is sent in chests to Europe from China. A substance called Talaflor or Talaclir, which is a concretion of the liquor in the cavities of the cane, and extracted at certain seasons, is said to be indelible by fire, to refit the action of the strongest acids, and by fusion with alkalies to form a transparent permanent glass which may be decomposed by acids, &c. The taphisler is much esteemed as a medicine by the orientals, and indeed several parts of the bamboo, according to Loureiro, poffes medicinal virtues. A. arborea, A. orientalis, of Miller, seem to be only varieties of A. bambus, and we learn from Loureiro and others, that there are still more varieties, if not found to be distinct species. 2. A. donax, cultivated reed. A. servius. Bauh. Pin. 17 Rain Hist. 1275. Mor. Hist i. 8. 1. 87. Calyces five-flowered, panicle diffused, culm hardly; culm from fisc
to twenty feet in height, hard, almost woody, jointed or
knotted, with divergents. Above each joint a leaf embrac-
ing the culm, with a yellow sheath, two feet long, and
three inches broad. The top of the culm ends in a point, the
leaves rolling in the form of a cone; panicle a foot and a
half long, erect, many flowered. Number of flowers in the
calyx variable, often two, but more commonly three. It
is a native of the south of Europe, Siberia, Egypt, Cochini-
china, &c. It was cultivated in 1648, in the Oxford botan-
ic garden, and flowers here in July and August. The
canes are brought to us from Spain and Portugal, for the
use of weavers, and for making fishing rods, &c. There is
a variety of A. donax, with stripped leaves, noticed by Miller
and others. 3. A. phragmitis, common reed. Smith Flor.
“Calyxes five flowered, panicle loose?” root perennial,
creeping; culms annual, erect, simple, six feet high, round,
jointed, leafy, smooth, white within; leaves lanceolate,
acute, spreading, striated, rough at the edges, under-
nearth very smooth and glaucous; sheaths cylindric, striated,
smooth; ripples very short, hairy on both sides; panicule
erect, dilated, much branched; glumes of the calyx very
unequal, lanceolate, acute, the larger three-nerved; florets
from four to six, surrounded at the base with a silky wool;
interior glume dilated, half the length of the exterior; seed
covered with the indurated corolla. A variety of this
species with variegated leaves is noticed by Relhan. It is
common in ditches, flooding waters, and on sides of rivers,
flowering from July till September. The common reed is
used for screens in gardens, also as a foundation for planter
in ceilings, and for various other purposes. 4. A. epigeros,
A. calamagrostis, Hudf. 54. Reih. 52. Liichtf. 166. calam-
agrostis lanceolata, With. 122. gramen arundinaceum paniculat
mollis pudicae major, Rauli Syn. 401. “Calyxes one-flowered,
longer than the corolla, panicule erect, leaves lanceolate;”
root creeping; culm nearly as high as the preceding, but
weaker, and often branched at the base; leaves lanceolate,
acute, leafy, underneath glaucous and rough at the edges;
sheaths smooth, striated; ripples lanceolate, many
lengths divided, naked on both sides; panicule erect,
spreading; flowers in clusters all on the same side, nodding;
glumes of the calyx nearly equal, lanceolate, acute, nervous;
rough on the keeled part; floret solitary, much shorter
than the calyx, white, membranaceous, inflated in a
woolly substance longer than the petals, often cloven at the
apex; near the base, and from the back arises an arm,
which is jointed, and nearly the length of the wool.
we are told by Dr. Smith, that the wool and arm here
noticed, were, from an error, not represented in the figure
referred to in Eng. Bot. It grows in shaded ditches and
wet meadows: and flowers in July. 5. A. calamagrostis,
Brit. 146. 186. A. epigeros, Hudf. 54. Tehl. 51. Cala-

epigeros, Rauli Syn. 401. “Calyxes one-flowered, longer
than the corolla; panicule erect, dilated; flowers scattered,
erect; leaves linear.” Smith. Root perennial, fibrous,
scarcey creeping; culm erect, three or four feet high, round,
very smooth, leafy, much flatter than the preceding, and
sometimes branched; leaves linear, acute, narrow, somewhat
involute, pale green underneath, rough above, sometimes
hairy; sheaths long, close, striated, almost smooth; ripples
lanceolate, often lacerated, decurrent, smooth on both sides;
panicule very branching, diluted; flowers scattered, erect;
glumes of the calyx of a chefнут or purple colour, nearly
equal, lanceolate, acute, keeled, rough on the back, scarcey
nervose; florets solitary, much shorter than the calyx, white,
torn at the apex, included in wool longer than the petals, a
small arm at the apex, between the divisions of the larger petal.
It grows in groves, hedges, and wet situations, flowering in
July. 6. A. arenaria, sea-reed. Marram. Sea-matweed,
Dickf. H. S. Fafes. 12. 5. Flor. Dan. 1. 917. Calamagro-
listis arenaria, With. 123. “Calyxes one-flowered, longer
than the corolla; panicule spicatid; flowers erect, awnless;
leaves rolled inwards, pungent.” Root perennial, creeping,
jointed, spreading itself to a great extent; culm about three
feet high, stiff, round, smooth, articulated, leafy; leaves erecto-
patent, rigid, turning inwards, sharply pointed, glaucous,
smoth on the under side, on the upper furrowed; sheaths
nervose, smooth; panicule erect, spike-like, with short erect
branch; flowers lanceolate, acute, compressed, keeled, ob-
scurely three-nerved; florets solitary, rather shorter than the
calyx; glumes lanceolate, unequal, nervose, with a rough
keel, the outer broadly, eroded at the apex, and embracing
the other; wool about one-third the length of the floret.
Common on the sea-cords, growing in the sand. By means
of its extensive creeping roots, it is of great use in giving
stability to driving sands which gather about it in hills or
banks. It is planted about Wells in Norfolk, to aid in
repelling the sea; a purpose for which it seems peculiarly
well adapted. 7. A. colorata, Canary reed-grasfs. Soland.
variagata. With. 124. Gramen arundinaceum acerfoli
glumæ noturns. Rauli Syn. 400. 8. G. arundinaceum acerfol
grumæ Jericinum. Rauli Syn. 400. 7. Phalaris arundini-
acea; 8. pica. Sp. Pl. 85. “Calyxes one-flowered, equal
to the corolla; panicule erect, glomerate; flowers inclining
to the same side, awnless; leaves flat.” Root perennial,
creeping, scaly, or turfry; culm erect, three to five feet high,
round, leafy, striated, smooth, furnished with many joints;
leaves spreading, lanceolate, striated, with a smooth margin
on both sides, on the variety 8, glaucous, in 7, variegated;
sheaths nervose, somewhat inflated, smooth; filippe short,
obtuse; panicule erect, branched, in lobes, branches angular,
rough; flowers rolled together, inclining to one side, varie-
gated with white and purple; glumes of the calyx equal,
compressed, keeled, three-nerved; florets solitary, the length
of the calyx, lanceolate, rather compressed, awnless, furnished
with two nectarious pencil-shaped substances at the base;
glumes or valves hairy, equal in length, but the exterior
broader than the other. It grows in fleshy waters, and
on the banks of rivers. The variety 7, cultivated in gardens,
and called riband-grasfs, was also found wild near Cambridge
by Mr. Relhan. The following are new species. 8. A.
panicule loose, from erect, spreading; awn of the outer petal
reflex, and very long.” A native of New Zealand. 9. A.
Amb. 1. 6. c. 7. t. 4. “Flowers fix-flamine, panicule;
spiked; spikeslets clustered; lower branches of the culm very
spiky; calyxes one-flowered.” It grows to the height of
thirty feet, and to the thicknees of a man’s arm. A native
of Cochinchina, growing on mountains and dry desert places.
Amb. 1. 6. c. 7. t. 4. “Flowers fix-flamed, panicule erect,
contracted; spikes long, imbricate; culm very even, unarm-
ced; calyxes one-flowered.” This is rather a higher and thicker
plant than the A. agrestis. It is cultivated in Cochinchina,
and being cut into long pieces, it is used for weaving into
hats, coffers, ballcets, and a variety of utensils, which are
very elegant. 11. A. multiplex, Lor. Cochinch. 58. Arun-
dabor,
ARUSPICES, an order of priests among the Ancient Romans, who foretold things to come, chiefly by inspecting the entrails of beasts which were killed in sacrifice. They also took their observations from the victims before they were cut up, from the flame that used to rise while they were burning; and from the flour, bran, frankincense, wine, or water, used in the sacrifice. The word seems more properly written haruspices; as being derived from harsus, which signifies the entrails of victims; and asperiores, to view or confederate others derive aruspices, ab arvis aucta veris, from their looking on the altar. These diviners were all at first taken from Etruria, where their art was in great repute; but afterwards the Senate ordered twelve of the sons of the chief men of Rome to be sent into that country to acquaint themselves with the rites and ceremonies of the Etruscan religion, of which this science was the chief part; the ceremony, however, of consulting the entrails of victims was practised among the Greeks before it was introduced into Etruria. An instance of it occurs at the battle of Platea; and it was recurred to on other occasions among the Aetati. But the Etruscans were perhaps the first who reduced it to an art, and established the rites by which it was conducted. The doctrine or discipline of the aruspices formed into a precise art, called aruspicitia. Cato, who was an aruspex, used to say, he wondered how one aruspex could look at another without laughing in his face; by which we learn what opinion he had of the fidelity of the aruspex. Confiantine paffed several laws against the aruspices; and though he allowed the Pagans to consult them, he forbade their entering the houses of private persons, upon pain of being burnt alive, and such as received them were to forfeit their estates, and be banished for life. His intention was to prevent all private sacrifices and consultations, and by one law he obliged those who consulted the aruspices to send their answers to his secretary.

ARUSPICI liber, a kind of facetted writings among the ancient Hetrurians, wherein the laws and discipline of the aruspices were described. They were also called rituales, sometimes fidigramatis libri, as directing how to take indications from thunder, lightning, &c.

ARVUM, in Ancient Agriculture, properly denoted ground ploughed, but not sown. Though the word is also sometimes extended to all arable or corn land, in contradistinction from pasture.

ARWACAS Bay, in Geography, lies on the east coast of
of South America, and bears the river Amona to the west. It has a good road for large ships, well sheltered from south and westerly winds, but exposed to the north.

ARWANGEN, a town and castle of Switzerland, in the canton of Berne, seated on the Ar, 12 miles east of Soleure.

ARX, in the Ancient Military Art, a town, fort, or citadel, for the defence of a place. The arx, in ancient Rome, was a distinct edifice from the Capitol Mount, stronger and better fortified than the rest, with towers and pinnated walls; in which was also the temple of Jupiter Capitolinus. Struv. Synt. Ant. Rom. c. ix. p. 522.

Arx also denoted a conterminous place on the Palatine Mount, where the augurs publicly performed their office. Some will have the arx to have been the augural temple; but Varro expressly distinguishes between the two.

Arx was particularly used for a public place in Rome, set apart for the operations of the augurs. In this sense, arx amounts to the same with what is otherwise called auguraculum, and auguratorium, and in the camp augurale. Out of this arx it was that the fretula, or heralds, gathered the facts used in the ceremony of making leagues and treaties. Liv. ii. c. 24.

ARX Britannica, in Ancient Geography, a citadel of Batavia, near the old mouth of the Middle Rhine. Its foundation is seen at low water, and after a strong south-westerly wind. Some suppose it to be the pharus or very high tower of Caligula, as Suetonius calls it; a monument of his pretended conquest of Britain; others imagine that it was built by Dufus, with an altar, erected by Claudius, on his expedition into Britain. But the usual passage was from Gefforacum, and Suetonius says expressly, that Claudius paused over from thence. Its ancient name is no where expressed; it is now called ch'tiues to Britten or Brittenburg, i.e. Arx Britannica; but it does not appear from what authority. Cellarius.

ARXAMA, a town of Afia, in the interior part of Mesopotamia. Ptolemy.

ARXAN, a town of Afia, in Armenia Major, near the river Nymphias.

ARXATA, a town of Armenia Major, on the confines of Astatus. Strabo.

ARXAN, a town of Thrace.

ARXIANUS, a plain of Afia, near the river Lerma.

ARY, a town of Greece, in the country of the Locris Epicsynedii. Diod. Sic.

ARYCANDUS, a river of Afia, in Lycia, that discharged itself into the Limyra. Pliny.

ARYS, in Geography, a people of South America, in Brazil, in the neighbourhood of Capitania, or the government of Porto Seguro. Jackson.

ARYMAGDUS, or ORYMAGDUS, in Ancient Geography, a river of Afia, in Cilicia. Ptolemy.

ARYMPHÆL, a people who inhabited the territory adjoining to the Palus Maeotis and Tanais. They were clothed like the Scythians, spoke a peculiar language, and lived in the woods. They were honored as a sacred people, and their country served as an asylum. They are mentioned by Herodotus and Mela.

ARYS, in Geography, a town of Italy, belonging to the republic of Venice, in the province of Friuli, ten miles W. S. W. of Palma la Nuova.

ARYTÆNOIDEUS CARTILAGO, in Anatomy, a cartilage situated at the back part of the larynx. There are two cartilages which bear this name.

ARYTÆNOIDEUS MUSCULUS, is subservient to the motions of the above mentioned cartilages. For an account of both these articles, see LARYNX.

ARYTHMUS or ARYTHMUS, formed from the privative a, and ő, is a moduls or measure, in M. and in Quintus, it is used by some for a linking or failure of the pulse, so that it can no longer be felt; but it more properly denotes an irregularity, or want of due order and proportion of the pulse.

ARYZAC, in Geography, a town of France, in the department of the Lower Pyrénées, and chief place of a canton in the district of Orthes, five leagues north of Pau. The place contains 1014, and the canton 10,531 inhabitants; the territory includes 175 kilometres and 29 communes.

ARYZACELI, or ARZACHEL, in Biographia, a Spanish mathematician, lived in the tenth or eleventh century, and wrote a book on Astronomy, intitled "Observationes de Obliquitate Zodiaca." Vouhis.

ARYZAMAS, in Geography. See ARZAMAS.

ARYZANO, a town of France, in the department of Finisterre, and the chief place of a canton in the district of Quimperle, five miles E.N.E. from Quimperle. The place contains 130, and the canton 5,658 inhabitants; the territory comprehends 124 square kilometres, and 3 communes.

ARYZBERG, a town of Germany, in the circle of Freisa, and principality of Bareuth, seven miles east of Wonnefeld.

ARYZENGAN, or ARZENGAN, a town of Afiatic Turkey, in the province of Aladula, eighty miles south-east of Erzerum. It was taken in 1742 by the Mogul Tartars.

ARYZEN, a town of Africa, on the coast of Barbary, in the Mediterranean, on the cape of Cabo Ferrat or Ferrol, and extends to the north-east as far as Cape Dyrre or Ivory. The town is at the south-west, in the bottom of the bay, and before it is good anchorage. It stands on the cape side of the river which here falls into the bay.

ARYZENA, or ARZENAYA, a river of European Turkey, in Albania, discharges itself into the gulph of Venice, between Durazzo and Parga.

ARYZE, in Ancient Geography, a town of the island of Cyprus, formerly a considerable city, and seat of a Greek bishop, but since the reduction of the island by the Turks, reduced to a village.

ARYZER, a town of Afia, situated towards the middle of the northern part of the lake Arsifa.

ARYZEV, in Geography, a sea-port of Africa, in the western province or province of Timflan, twelve miles S.E. of Cape Ferrat. It is called by the Moors, the port of the "Beni Zean," after the name of the neighbouring Kabyles, who were formerly a considerable community. Ptolemy places his "Deorum portus" betwixt Quiza and Arefania, which, says Dr. Shaw, can be no other than this, provided Geeza or Warran is the ancient Quiza; as Arzew is, without doubt, the ancient Arifemia. Arzew is at the distance of three Roman miles from this port, as Pliny places his Arefania. The country behind it is a rich champagne ground, but towards the sea there are steep rocks and precipices, which must have served for its defence in that direction. The water now used by the inhabitants lies lower than the sea, and of course is brackish. But for obtaining a supply of fresh water, the whole city was formerly built upon cisterns, of which several still remain, and serve for dwellings to the inhabitants. Several ancient ruins of capitals, bases, and shafts of pillars, with sepulchral inscriptions, are scattered over this place. Five miles from the sea-coast are the fall-pits of Arzew, which supply the neighbouring communities
with spirit. This commodity, as the pits are exhaustible, would be a very valuable branch of trade under any other government than that of the Turks. Shaw's Travels, p. 14.

ARZILLA, a sea port town of Africa, on the coast of the Atlantic, in the empire of Morocco, built by the Romans at the mouth of a river, site of five leagues from Tangiers, and now inhabited by Moors and Jews, who carry on no trade. It was formerly a Roman colony, afterwards fell under the Government of the Goths, and was next taken by the Mahometans. It was taken and burned by the English; after which it remained waste and uninhabited for thirty years, but was rebuilt by the caliphs of Cordova. In the year 1470, it was taken by Alphonso king of Portugal, called the African; and abandoned by the Portuguese about the end of the sixteenth century. N. lat. 35° 30'. W. long. 5° 30'.

ARZUS, in Ancient Geography, a river of Thrace, which ran into the Propontis at the latitude of about 42°.—Alfo, a town of Thrace, called also Arcam and Affius, situate between Oprimna and Sabzupara, eighteen miles from the former, and twenty miles from the latter.

AS, among Antiquaries, sometimes signifies a particular weight; in which feine the Roman as is the fame with the Roman libra, or pound. See Libra.

The word is by some derived from as, which, in the Doric dialect, is used for a, one, q. d. an entire thing; though others will have this name named as, quali as, because made of brass. —Budæus has written nine books De affer, & ejus partibus; "Of the as, and its parts."

The as had several divisions. See the table under As, an integer. See also Weight.

As was also the name of a Roman coin, which was made of different materials and different weights, in different ages of the commonwealth.

Under Numa Pompeius, according to Eusebius in his "Chronicon," the Roman money was either of wood, leathcr, or thulls. In the time of Servius Tullius, who reigned in Rome about 578 years before Christ, it was copper or brass, and was called as libra, libelles, or pondo, because actually weighing a pound, or twelve ounces. Mr. Pinkerton is of opinion, that we may value the as librae of ancient Rome at about eight-pence English. This was called æs græcum; and these affer were weighed, and not counted. The coinage of Tullius seems to have been confined to the as, or piece of brass, with the impression of Janus on the one side, and the prow of a ship on the other, because Janus arrived in Italy by sea. Varro, however, informs us, that the first coins of Tullius had the figure of a bull, or of other cattle upon them, like the Etruscan coins, of which they were imitations; and hence it is said they were called jecucia. These affer with the figure of Janus and the prow of a ship upon them, may be supposed, according to Mr. Pinkerton, first to have appeared about 400 years before Christ; but in a short time, various subdivisions of the as were coined. The femis, or half, is commonly stamped with the head of Jupiter laureate; the triens, or third, with four cyphers, as being originally of four ounces weight, has the head of Minerva; the quadrans, or quarter, marked with three cyphers, has the head of Hercules wrapt in a lion's skin; the sextans, or sixth, with two cyphers, is marked with the head of Mercury with a cap and wings; and the uncia, having one cypher, is marked with the head of Rome. All these coins appear to have been cast in moulds, by a considerable number at a time; afterwards the smaller divisions were struck, instead of being cast; but the larger continued to be cast until the as fell to two ounces. At this time, however, it was called libra, and accounted a pound of copper; though larger denominations of it were coined, such as the biennis or double affer, the triennis and quadrans of three and four affer, and even as far as decennis or ten affer, marked X. The smaller parts of the affer, however, were probably owing to their small value; though some are still found, such as the femis, triens, quadrans, sextans, and uncia, coined in the times of Nero and Domitian. Some coins occur which exceed the as librae in weight; and these are supposed to be prior to the time of Servius Tullius. The Romans reckoned by affer before they coined silver, in the 485th year of the city, or 269 before Christ, and afterwards they kept their accounts in featers.

Phyn says, that when the first Punic war had exhausted the treasury, they reduced the as to two ounces. They thus gained fifteen parts, and were enabled to pay their debts. Mr. Pinkerton is of opinion, that Phiny, in affecting that the as continued a pound weight till the end of the first Punic war, is mistaken. Coins, that refute this assertion, are still found; and he thinks it probable that the as decreed gradually and slowly in weight, as from a pound to an ounce, then to ten, nine, &c.; but neither the as nor its parts were ever correctly fixed. In the second Punic war, when the Romans were much pressed by Hannibal, about the year of Rome 358, or 216 before Christ; Fabius Maximus being dictator; the affer were further reduced to an ounce each; and the silver denarius was made to pass for sixteen affer, the quinarius for eight, and the fetherc for four; and the republic gained upon the copper money one half. This took place about thirty-six years after the former reduction. The as libralis, with the face of Janus upon it, is the form most commonly occurring before it was reduced to two ounces. Mr. Pinkerton supposes, that this continued for at least a century and a half after the coinage of Tullius, till about 300 before Christ, in the year of Rome 454, between which and the 502d year of Rome, a gradual diminution of the as to two ounces must have taken place. The following table exhibits, according to Mr. Pinkerton, the dates of the Roman coinage. The libralis coined by Tullius with the figures of oxen, &c. about 167 years after the building of Rome, according to Sir Isaac Newton, or about the year before Christ 460, or 587 according to Blair.

| Aser libralis, with Janus and the prow of a ship | 400 |
| As of 10 ounces | 300 |
| 8 | 290 |
| 6 | 280 |
| 4 | 270 |
| 3 | 260 |
| 2, according to Phyn | 250 |
| 1, according to the fame | 214 |

Lastly, by the Papian law, the as was reduced to half an ounce; and it is generally thought that it rested here all the time of the commonwealth, and event till Vespasian's reign. This law was called the Papian as, because the law just mentioned was paifed in the year of Rome 563; or, according to the Varronian computation, 151 before Christ, by C. Papirius Carbo, then tribune of the people. Thus, there were four different affer in the time of the commonwealth. The figure stamped on the as was at first a head, ox, or fow; and from the time of the kings, a Janus with two faces on one fide, and the roftrum or prow of a ship on the reverse.

The triens and quadrans of copper had the figure of a small vessel called ralis on the reverse. Thus Phyn: Neda aris (i.e. affer), fui ex altera parte Janus geminus, ex altero roftrum navis: in triangulo & quadrante rotas. Hist. Nat.lib. xxxiii. cap. 3. Hence these pieces were sometimes called raliti.

After the Romans began to have an intercourse with Greece, various elegant figures appear upon the parts of the
ASA, though not on the as itself till after the time of Sylia. Towards the latter end of the republic, dupondii, or double asa, were coined, together with the sesterii aurei, which supplied the place of the quadrans; when the denarius began to be reckoned at sixteen asses; probably at the time when the latter was reduced to half an ounce. M. Paullus, in his "Metrology," estimates the value of the as, from the foundation of Rome till the year 537, at 20 foils, or a livre; though it was sometimes 20 foils: from the year of Rome 537 to the year 544, at 3 French foils, its weight being two Roman ounces of copper; from 544 to 586, at 1 foils, its weight being one Roman ounce: from 586 to the reign of Claudius or of Nero, 1 foil 10 deniers: from the reign of Claudius or of Nero to that of Constantine, about 1 foil. See Coins, and Coinage.

As was also of d to denote any integer, or whole—Whence the English word acre.

Thus, as signifies the whole inheritance; whence hares or oxen, the heir to the whole estate.

Sophists, or Roman acre of land, being reckoned the integer, was called as, and divided, like it, into twelve

The as, and its parts or divisions, stand thus:

As, or As, in Mythology, a name given to a deity of the inhabitants of the north. Speculations suggested, that when the Atonites were driven from their country by Pompey, they retired into the northern regions; but as they were a delicate and polished people, they defied the barbarous names of the north, and they were regarded among the rude inhabitants of these countries as superior to mortals, or as a species of divinities. Acquainted therefore to express any thing that was sublime and excellent by the terms Asa and As, they applied these appellations to their gods.

ASA, in Scripture Biography, a king of Judah, was the son of Abijam and succeeded him A. M. 3049, B. C. 955. He was zealous in the establishment and maintenance of true religion, and active in demolishing altars created to idols, and in restraining and punishing such as were addicted to the infamous practices connected with idolatry, and restoring the worship of Jehovah. He obtained a decisive victory over Zerah, king of Ethiopia, in the plain of Zephathah or Zephaiah near Mahelah. In his contest with Ithaa, king of Israel, he called in the affinities of Beninadad, king of Syria, for which he was reproached by the prophet Hanani, whom he severely punished. He died A. M. 3090. B. C. 913, after having held the sceptre of Judah nearly forty-one years. 1 Kings xv. 8, &c. 2 Chron. xiii.—xvi.

ASA, in Geography, a river of Germany in the archdechy of Austria, which runs into the Danube two miles north of Erfeding.

ASA, among Naturalists. The writers of the later ages have formed this word asa from the lificador of the ancients, and attributed it to a gum very different from that anciently known by the name they have thus corrupted. The asa of the ancients was an odorous and fragrant gum; and the asa of the after ages had little title to this epithet, that they distinguished it by one, expressing its being of an offensive or flinking smell. The Arabian writers, according to this distinction, describe two kinds of asa, the one flinking, the other aromatic; and the modern Greeks appropriated the name asa, or lafar, to the flinking gum the Lattins called by that name, but added a distinctive epithet to express its smell, and called it farsafyrorum.

ASA Dutia, in the Materia Medica, a name by which some authors have called the benjamin of Benzon of the shops. Dale.

ASA Petida, or ASA Petida. See Ferula.

ASA BORUM PROMONTORIUM, in Ancient Geography, a promontory of Arabia, in the latitudes of the Persian gulf.

ASD, a town of Persia, in the province of Farisian, forty-seven leagues north-west of Schirin.

ASAD-ABAD, a large and populous town of Persia, in the province of Itrc-Ageni, on the frontiers of Kurlutan, twenty-two leagues N. E. of Amadan.

ASEI, in Ancient Geography, a people of Asia, in Sarmatia. Ptolomy.

ASAM, or ASAIN, in Geography, a country of Asia, situate to the north-east of Bengal, and bounded on the north by Tibet, on the west by Hindolfan, on the south by Meckley, and on the east by part of the Birmah empire, or Ava. Its districts commence, where the river of Bengal end, in N. lat. 26°, and E. long. 91°. This country is divided into two parts by the river Brahmaputra, or Burrampoot, which flows from Kista. The northern part is called Utarein, and the southern Dachinbala; the former begins Gevahnuty, the boundary of the Mogul possessions, and terminates in mountains inhabited by a tribe called Meeri Mechina; and the latter extends from the village Sides to the hills of Siringar. Asam is of an oblong figure; its length about 200 standard 50s, and its breadth from the northern to the southern mountains about eight days' journey. Several rivers flow from the southern mountains of Asam, and fall into the Burrampoot; and the chief of these is the Dhone. Between these rivers is an island well inhabited, and in an excellent state of tillage, containing a spacious and pleasant country that extends about fifty 50s. The cultivated tract is bounded by a thick forest, which harbours elephants, and where those animals may be caught, as well as in four or five other forests of Asam. These animals are so numerous, that five or six hundred may be procured in a year. Sazer's Dhone, on the side of Gherong, which is the capital of the country, is a wide, agreeable, and level country, the face of which is marked with population and tillage, and presents everywhere delightful prospects of ploughed fields, harvests, gardens, and groves. This island lies in the part called Daghinal. As the country is overflowed in the rainy season, a high and broad causeway has been raised for the convenience of travellers from Salagoreh to Gherong; each side of which is planted with bamboos, the branches of which meet and are intertwined, and thus afford a pleasant shade. Amongst the fruits which this country produces are mangoes, plantains, jackes, oranges, citrons, limes, pears, and pomegranates, a species of anleh, which has such an excellent flavour, that every person who tastes it prefers it to the plum. There are also cocoa-nut trees, pepper-vines, areca-trees, and the faah, or mulbatherm, in great plenty. The sugarcane excels in softness and sweetness, and is of three colours, red, black, and white. There are ginger which is free from fibres, and betel vines. Such are the fertility and fertility of the soil, that any seed that is sown, or slips that are planted, always thrive. The principal crop of the country consists in rice and mah, which is a species of grain: wheat and barley are never sown. The filks are excellent, and resemble...
resemble those of China; but they manufacture few more than are required for use. They embroider with flowers, and weave velvet and silk stuffs, a kind of silk, of which they make tents and coverings, or the walls that surround their houses are defended and fear; but it is found at the bottom of some of the hills, of a bitter and purging quality; a better fort, extracted from the plantain-tree, is more common. The mountains, inhabited by a tribe called "Nanacs," produce plenty of excellent lignum aloes, which the natives annually import into Afam, and barter for salt and grain. These people are naked, and feed on dogs, cats, fakes, mice, rats, ants, and locusts. The hills of Camrun, Sida, and Laufitergh, supply a fine species of lignum aloes, which flows in water. Several of the mountains contain marble.

The country of Utiracal on the northern side of the Bur- rumpooter, is in the highest state of cultivation, and produces plenty of pepper and areca nuts; it even furnishes Dac-

nineluc in population and tillage. The breadth from the banks of the river to the foot of the mountains, where the climate is cold, and in which there is snow, is various; but it is no where less than fifteen, nor greater than forty

cous. The inhabitants of the mountains are strong, have a robust and respectable appearance, and are of the middling size. Their complexions, like those of the natives of all cold climates, are red and white; and they have also trees and fruits peculiar to frigid regions; several of the hills in the country of Dereng, on the side of Gwahutty, supply milk, kitten or mountain cows, beef and pork, which are two kinds of blanket, and two species of horses called geot and tanys. Gold and silver are procured here, as also in the whole country of Afam, by washing the sand of the rivers. This, indeed, is one of the sources of revenue. It is supposed that 12,000, and some say 10,000 inhabitants, are employed in this occupation; and each of them pays a fixed revenue of a ton of gold to the rajah; a ton containing eighty reti weights, and eight retis being equal in weight to twenty-four barley ears, or seven carats among jewelers. The people of Afam (says the writer whose account is here cited) are a bafe and unprincipled nation, and have no fixed religion. They follow no rule but that of their own inclinations, and make the approbation of their own vicious minds the test of the propriety of their actions. They do not adopt any mode of worship practiced either by Mahometans or Heathens; nor do they concern with any of the known sects which prevail amongst mankind: unlike the pagans of Hindoostan, they do not reject victuals which have been drest by muflimans, and they abstain from no flesh except human. They even eat animals that have died a natural death. It is not their custom to veil their women. The men have often four or five wives each, and publicly buy, sell, and change them. They have their heads, beards, and whiskers, and reproach and admonish every person who neglects this ceremony. It has been af-

fected that their language has not the least affinity with that of Bengal; but others say, that young Brahmins often come from Afam to Nadiya for instruction, and that their vulgar dialect is understood by the Bengal teachers. Their strength and courage are apparent in their looks; but their ferocious manners and brutal tempers are also betrayed by their phylognomy. They are superior to most nations in corporal force and hardly exertions. They are enterprising, savage, fond of war, vindictive, treacherous, and deceitful. The virtues of compassion, kindness, friendship, sincerity, truth, honour, good faith, and purity of morals, have been left out of their composition. Their drefs consists of a cloth tied round their heads, another round their loins, and a sheet thrown upon their shoulders; but it is not customary to wear turbans, robes, drawers, or shoes. There are no buildings of brick or stone, or with walls of earth, except the gates of the city of Ghengong, and some of their ido-

litrous temples. The habitations of the rich and poor are contructed of wood, bamboo, and straw. The rajah and his courtiers travel in flatly litters; but this is not the case with the junior and respectable persons among his subjects who are carried in lower vehicles, called daddies. Afam produces neither horses, camels, nor assels; but those animals are sometimes brought thither from other countries. The brutal inhabitants, from a congenial impulse, are fond of seeing and keeping assels, and they buy and sell them at a high price; but they are much surprised at seeing a camel; and are so afraid of a horse, that if one trooper should attack 100 armed Afamians, they would all throw down their arms and fly, or if unable to es-
cape, would surrender themselves prisoners. Yet if one of this detestable race should encounter two men of another na-
tion on foot, he would defeat them.

The ancient inhabitants of this country were divided into two tribes, the Afamians and the Cullitians. The latter fixed the former in all occupations except war and the conduct of hardy enterprises, in which the former are superior. A body guard of 6 or 7000 Afamians, dressed as demons, of unshaken courage, and well provided with arms and warlike accompaniments, always keep watch near the rajah's fitting and deeping apartments; these are his loyal con-

fidential troops and patrol. The martial weapons of this country are the musket, sword, spear, and arrow and bow of bamboo. In their forts and boats they have plenty of cannon, zerbzen or swivels, and ramchangees, in the manage-

ment of which they are very expert. Whenever any of the rajahs, magistrates, or principal men die, they dig a large cave for the deceased, in which they inter his women, attend-

ants, and servants, and some of the magnificent equipages and useful furniture which he possessed in his life, time, such as elephants, gold and silver, badash or large fans, carpets, clothes, victuals, lamps, with plenty of oil or a torch burning, for they consider these articles as stores for a future

flair. They afterwards construct a strong roof over the cave upon thick timbers. The rajahs of the country have never yielded submission and obedience, nor paid tribute and revenue to the most powerful monarch; but they have curbed the ambition, and checked the conquests of the most victorious princes of Hindoostan. When an in-
vading army has entered their territories, the Afamians have covered themselves in strong poits, and directed the enemey by stratagems, surprifes, and alarms, and by cutting off their provisions. If these means have failed, they have declined a battle in the field, but have carried the peafants into the mountains, burn the grain, and left the country empty. But when the rainy season has set in upon the ad-
vancing enemy, they have watched their opportunity to make excursions, and vent their rage; and the famished in-

vaders have either become their prisoners, or been put to
death.

The preceding account of the Afamians, who are prob-
ably superior in all respects to the Moguls, exhibits a

c specimen of the malignity and intolérance with which it was usful, in the reign of Aurungzebe, to treat all those whom the crafty, cruel, and avaricious emperor, was pleased to condemn as infidels and barbarians. It is extracted from "A description of Afam," written by Mohammed Caxim, and translated from the Perzian by Henry Vaghet-
tart, Esq. Asiatic Researches, vol. ii. p. 171-183. It should be re-collected, in justice to the people of Afam, that the author was an enemy, and a rigid Mahometan, resident at the
the coast of ArgomBce. The diet of the Aaswae, though less refined than that of the Hindoes of Bengal, is by no means promiscuous; and their religion does not materially differ from that of Hindoesan, and little be proved by their coins, on which are inscribed the names of the Hindoo deities.

ASAMA, or ASANA, in Ancient Geography, a river of Africa, in Mauritania Tingitana.

ASALMON, a mountain of Palestine, in Galilee, overagainu Sephuri. Jot-phus.

ASAMAR, a town of India, on this side of the Ganges. Potemey.

ASANCH, a town of Germany. Potemey.

ASANCHE, in Geography, a town of Asia, in the country of Dierbekir, situate on the Tigris, on the borders of Armenia.

ASANGA, a jurisdiction of South America, under the bishop of Cufco, in Peru, fifty leagues from that city, in which are bred many cattle. In the north-east part of it there are some silver mines.

ASAPH, in Biography, a celebrated musician in the time of David, was the son of Barachus of the tribe of Levi. Asaph, and also his descendants, professed over the musical band in the service of the temple. Several of the psalms, as the 50th, the 73d to the 83d, have the name of Asaph prefixed; but it is not certain, whether the words or the music were composed by him: with regard to some of them, which were written during the Babylonish captivity, they cannot in any respect be ascribed to him. Perhaps they were written or set to music by his descendants, who prefixed to them his name, or by some of that class of musicians of which the family of Asaph was the head. 1 Chron. vi. 39. 2 Chron. xxix. 30. xxxv. 15. Nehem. xii. 46.

ASAP, St. a monk of North Wales, was descended of a good family, and belonged to the church of Llan-Ely, over which Kentigern the Scotch bishop of that place presided. Upon the removal of this prelate to his own country, he alleging his consent and cathedral to St. Asaph, so that after his death Llan-Ely lost its name and took that of the saint. He was a diligent preacher, and frequently repeated this saying, "They who withhold the preaching of God's word, envy man's salvation." He flourished about the year 590, under Carentius king of the Britons; but the time of his death is unknown. The feast seems to have continued vacant above 500 years, till it was filled by Geoffrey of Monmouth. St. Asaph was eminent in his time for learning and sanctity; he wrote the "Ordinances" of his church, the "Life" of Kentigern his master, and some other pieces. Biog. Brit.

ASAP, St. in Geography, a city and bishop's see in Flintshire, which derived its name from St. ASAP. The diocese consists of part of Denbigh, Flint, Montgomery, and Merionethshire, and a small part of Shropshire; containing 41 parishes and 91 churches and chapels, most of which are under the patronage of the bishop. The see is valuable, and the patronage extensive. The town is seated on an eminence near the sea, at the termination of the vale of Chwydd. Although it is denominanted a city, it is merely a village in extent. Its fine Gothic cathedral has been lately improved in its external decoration, and its palace has been rebuilt by the late bishop (Bagot); which being situated above the town, fronting the hill towards Holywell, commands a pleasant view.

ASAPEIS, asepr, from z, negative, and aabem clear, open, in Hippocrates, in Prohr. & Coce. are such patients as do not utter their words in a clear manner. The defect is occasioned, as Galen says, Comm. 2 in Prohr. "either by some hurt which the organs of speech have contracted from a disorder of the nerves, or else by a delirium."

ASAPEHADAM, in Ancient Geography, a town of Syria, in the Chalcidean territory. Potemey.

ASAPEES, or AAZAPES, an order of soldiers in the Turkish army, whom they always expose to the first shock of the enemy; to the end that the enemy being thus fatigued, and their swords blunted, the pashas and janissaries may fall on, and find an easy conquest.

The word is derived from the Turkish saph, which signifies rank, from whence they have formed asaph, to range in battle.

The afappes are said to be held of fo little value, that they frequently serve as bridges for the cavalry to pass over in bad roads, and as fascines to fill up the ditches of places beleaguered.—The greatest part of them are natural Turks; they travel on foot, and have no pay but the plunder they can get from the enemy.

ASAR, in Commerce, a Persian coin worth 6s. 8d. sterlings.

ASARHADAD, or ASARHADON, in Biography, son of Sennacherib, king of Syria, succeeded his father about 709 years before Christ, and having reigned 29 years in Nineveh, he became also king of Babylon, in the year 680 before Christ. He sent a colony of Babylonians and Cutharians into Samaria; and his generals having taken captive king Manasles, sent him loaded with chains to Babylon. His reign terminated in the year 667 before Christ.

ASARINA, in Botany. See Antirrhmum, and Cheilone.

ASARO, in Geography, a town of Sicily, in the valley of Noto, eight miles south of Nicofia.

ASAROTA, aseweta, from a and asew, if sweep, a kind of painted pavements, in use before the invention of mosaic work. The most celebrated was that at Pergamus, painted by Sefus, and exhibiting the appearance of crumbs, as if the floor had not been swept after dinner, whence, according to Pliny, the denomination. Perrot supposes them to have been a black kind of pavements of a spongy matter. Plin. Nat. Hist. lib. xxxvi. cap. 25. Perrot ad Vitruv. lib. vi. cap. 5.

Species. t. A. eurobapus, common afarabacca. Hadf. 265. With. 440. Smith. Flor. Brit. 509. Med. Bot. t. 86. Flor. Dan. t. 653. "Leaves kidney-shaped, obtuse, in pairs;" root perennial, creeping; stems short, simple, round, pubescent, one-flowered, and commonly two-leaved; leaves opposite, on long footstalks, reniform, perfectly entire, somewhat downy; flower terminal, pitcher-shaped, of a dark purple colour, villose, on a slender peduncle. It has been found in the north of England, in woods, particularly in Lancashire, but it is a very scarce plant in Britain. The time of its flowering is in May.

Medicinal
ASB

Medicinal Properties. The leaves and roots of asarabacca are strongly emetic and cathartic; the latter indeed has been observed to excite vomiting in invariably, that they have been proposed as a substitute for ipecacuanha. At present, however, this plant is seldom given internally, as the evacuations expected from its use may be produced with more certainty and safety by various other medicines: it is now chiefly employed as an emetine or febrifuge, and is found to be the most useful and convenient in the Materia Medica. For this purpose the leaves being less acid than the roots, are preferred. A few grains sufficed to the nose several evenings produce a considerable watery discharge, which sometimes continues for several days, by which head-ache, tooth-ache, ophthalmia, and some paralytic and soporific complaints, have been effectually relieved. The college directs a pulvis afarici compotitis. See Woodv. Med. Bot. p. 328. 2. A. canadensis, Canadian asarabacca. Mill. figs. 53. i. 6. “Leaves kidney-shaped, mucronate;” the leaves of this are much larger than those of the preceding; their foot-flats are also longer; in this species the leaves are pointed and hairy; and the flower, greenish on the outside. A native of Canada, cultivated by Miller in 1751. It flowers from April to July. “Leaves heart-shaped, blunt, smooth, petiolate,” the leaves of this are veined and spotted on their upper surface, like those of the autumn cyclamen. The flowers are shaped like the others, but stand on longer peduncles, and are of a darker purple. A native of Virginia and Carolina; also of several provinces in China. Both this and the second species were found in Japan by Thunberg. Cultivated by Miller in 1759.

Propagation and Culture. These plants delight in a moist shady situation, and may be increased by parting the roots in autumn. Much wet in winter will rot the Canadian species, and the last species will not bear too much sun. See Martyn’s Miller’s Diet.

ASARUM Hypocistis. See Cytinus.

ASASI, a name given by the people of Guinea to a tree, the leaves of which being boiled in water, and held to the mouth, cure the tooth-ache. This tree in its form and manner of growing resembles the laurel; the leaves are very hard and stiff, and grow alternate on the flanks; they have short pedicles, and the branches are blackish and rugged, but they are variegated with small reddish spangles, or scaly protuberances. Phil. Trans. N° 232.

ASAWNLLY, in Geography, a town of Hindooftan, in the circuit of Oudipour, eighteen miles south-west of Oudipour.

ASBAMAE, in Ancient Geography, a fountain dedicated to Jupiter, near Tyana in Cappadocia. Phliusofratus, in his life of Apollonius, says, that the waters, though in a state of ebullition, were cold, and that they were pleasant and refreshing to those who observed their toilets, but poisonous and fatal to bars and perfumed persons. Jupiter had a temple near this fountain.

ASBANKEI, a town of Asia, in Nawaraaher Trans-Oxana, or Zagatal.

ASBECK, in Geography, a town of Germany, in the circle of Weftphalia, four miles south-east of Ahaun.

ASBESTINE, something incombustible, or that partakes of the nature and qualities of the lapis asbestus. Such as asafinite paper and cloth. See ASBESTUS.

ASBESTINE, and ASBESTRIO of Kirwan, in Mineralogy. See Steahlestein.

ASBESTINUM, in Natural History, a species of Alyconium, described by Petiver, Pallas, and others. It inhabits the American fens, is very porous, white, and rosy within; the specific character is, item rather simple, roundish, with large, oblong pores scattered on every part. Olmec, &c. Petiver calls this kind Puteus trigonius Americanus, C. v. 1. 23. f. 2.

ASBESTOS; falsi, is a name given to plume alum. See ALUM.

ASBESTUS, in Chemistry, formed of the priv. α, and σωμα, to extingui, Asbestoniron. Fr. Asbestos, immutarius of the old mineralogists. Geminier asbest. Germ. Taleum asbestus vulgaris. Werner. The most usual colour of asbestos is black-green; sometimes mountain; or olive-green, more rarely greenish or yellowish grey. It occurs in masts. Hexahedral prismatic crystals of asbestos are also mentioned as having been found at Griesbach near Paffau, and rhomboidal prisms of the same at Gemundt in Carinthia, and at Bagneres; according, however, to Emmerling and Lentz, there are not crystals of asbestos, but of ilahhlein. Internally it is shining, or little shining with a silky or waxy lustre. Its fracture is parallel fibrous, either straight or curved, sometimes also splintery. It generally flies, when broken, into long splintery fragments. It is translucent in the edge; is tender, splitting into half; is brittle, slightly elastic; somewhat mucous to the touch. Sp. gr. according to Kirwan, 2.547.

Asbestos does not effervescce with acids; before the blowpipe it fumes without addition, but very difficultly, in a greyish black flag; at 160° of Wedgewood, it forms a grey porous porcelain, of sufficient hardness to fire with fire.

The results of the analysis of this mineral are as yet but little satisfactory. Bergman analyzed three specimens, from which it appears, that asbestos consists of 60...67 per cent. of fibres, 13...16 carbonated magnesia, 6...12 carbonated lime, and a very variable proportion of alumine and iron. Weigle, on the other hand, found in the asbestos of Zöblitz 48.45 magnesia, 46.66 fibres, 4.79 iron. It is fo lately, however, that the art of chemical analysis has been brought even to an approximation of certainty, and the caufls of error are still fo numerous, that with the exception of Klaproth, Volquin, Chenevis, and perhaps a few others, hardly any authority is to be attached to the various chemists who have been engaged in this very important but most difficult branch of mineralogical science.

Asbestos is found in serpentine rock, and, in general, in the same situations as amianthus. It is sometimes mixed with indurated talc and magnetic iron.

The more flexible varieties have been applied to the manufacture of incombustible cloth, in the same manner as Amianthus; which see, Kirwan’s Mineralog. vol. i. 159. Brochant. Mineralog. v. i. 497. Wedemann. Handb. der Mineral. p. 451. Lentz. Verfuß &c. v. i. p. 537. ASBISI, in Geography, a small kingdom of Africa, in Guinea, on the gold coast.

ASBROIT, in Geography, a town of Sweden, in South Gothland, six miles north of Wardberg.

ASBURG, a town of Germany, in the circle of Weiphalia, and county of Meurs, two leagues east of Meurs, and six miles west of Dilsburg.

ASBYSTÆ, in Ancient Geography, a people of Africa, in Libya, placed by Herodotus above Cyrene. Euthathus places them near the temple of Jupiter Ammon, and the fountain of the sun.

ASCA, in Geography, the name of a town of Arabia Felix.

ASCAGNE, Ascanius, in Zoology, a new species of Sinia.
ASCALON, a maritime town of Palæstine, and one of the five Satrapies of the Philistines, situate on the Mediterranean, and placed by Josephus at the distance of 320 furlongs west of Jerusalem, between Azotus to the north, and Gaza to the south. It was esteemed the strongest of the Philistine coast; and yet the tribe of Judah, to whose lot it fell, made themselves masters of it soon after the death of Joshua. Venus, called Urania or Caelitis, was worshipped in this city; and Herodotus relates, that this temple was pillaged by the Scythians about 632 years before the Christian era. There was another divinity, which was the object of worship in this place, called by Diodorus Siculus, Demeter, represented as half a woman and half a fish; and near it was a lake full of fishes, consecrated to this goddess, which the inhabitants, on this account, refrained from eating, as they also did from pigeons, supposed to be under her protection. This city had its own kings, and was successively under the dominion of the Assyrians, Persians, Greeks, and Romans. It was the native place of Herod the Great, who was hence called Acalonites, and who built a palace, which Augustus, after the death of Herod, gave to his foster son Salome. The port of Acalon was at some distance from the city. This city was made an episcopal see from the earliest ages of Christianity; and, during the holy war, was adorned with many flately edifices, all of which have been since ruined by the Saracens and Turks. It is still in being, though reduced to a small village called Scaldon. It was anciently famous for its ecclesiastics, which took their name from this town. N. lat. 31° 50'. E. long. 16° 44'.

ASCALPHUS, in Entomology, the name of a Fabrician genus of neuropterus insects, which in the Linnaean system belong to that of Myrmeleon. The character is, pali nearly equal, and filiform; jaw ciliated; lip horny, rounded, and entire. In other works of Fabricius it is thus defined: pali fix, nearly equal, and filiform; antennae elongated and ciliated. Gmelin forms a subdivision of his genus Myrmeleon, under the name acalpus, in which are included the species longicorhis, barbarus, aurialis, and cayennensis, all of which are truly alcalphii of Fabricius.

ASCANDALIS, in Ancient Geography, a town of Asia Minor, in Lycia. Plisty.

ASCANIA, a name given by Pliny to one of the islands of the Archipelago.

ASCANIA, a country of Asia Minor, in Bithynia, extending from the river and lake Acan, between the sea, the river Scarn, and mount Olympus. Sal.ii.

ASCANIA, small islands on the coast of the Tronde. Play.

ASCANII, in Entomology, a species of Cuculus, of a cylindrical shape, black, and bluish on the sides. Fabricius, Herb. &c. — A. Cuculio cylindricus of Herbst and Fuelich (Archives des Insectes), is considered by Gmelin as a variety (a) of this insect. Inhabits the south of Europe.

ASCANUS, in Biography, called also Iulus or Illus, the son of Ancas by Creufia, the daughter of Priam; or, as others say, by Lavinia, accompanied his father in his flight and dangers, and succeeded him in the government of Lavinium, in the year before Chrif 1177. He was called Acanus from a river of that name in Phrygia, and Illus, changed into Iulus, from Ilium or Troy. Having defeated Mezentius, king of the Tucans, who demanded of the Latins a tribute of all the wine produced in Latium, he made peace with them upon condition that the Tiber should be the boundary between the Latin and Hetrurian territories. When he found it expedient to resign Lavinium to Lavinia and his son Sylvius, he determined to build another city for the place of his residence, and the capital of his kingdom, which he called Aella Longa. Here he resided about 12 years; and, after a reign of about 38 years, died in this city in the year before Chrif 1140. Dion. Hal. I. i. p. 51, &c. Livy, I. c. 3.

ASCANUS, in Entomology, a species of Papilio (Eq. Tr.). Above and beneath black, with a common white band; posterior wings clouded with red. Fabricius, &c. Inhabits Brazil.—The body of this insect is black, and the breath is spotted with red.

ASCANUS, in Ancient Geography, a river of Asia Minor, in Bithynia, according to Pocleny, by which the lake Aca- cania or Acanus discharged its waters into the sea. Pliny places it in a gulf near Etheleum.—Alfo, a port of Asia, placed by Pliny near the city of Phocaea.—Alfo, a lake of Asia Minor, in Bithynia, now the lake of Ilinit, near which Pliny places the city of Nicaea.

ASCARA, in Geography, a town of Japan, in the province of Sino-odukye.

ASCARDIC, the capital of the country of Asia, called Little Thirer.

Species, 1. Acetaria pollychaeta. Forl. Flor. Austral. n. 364. A native of the Society islands in the South seas. ASCARIS, in Natural History, is the generic name of those creatures belonging to the tribe of Verme insculpfa, which have a round and elastic body, tapering towards each extremity; three protuberances at the head; tail obtuse or furbulate; and the intestines spiral, milky white, and pul- lucid.

The knowledge of the ancients concerning these animals was apparently very limited; and they invariably confounded the ascarides with other intestinal worms. To Redi much credit is due for directing his researches to this intricate subject; and though his discoveries are not of material moment, he was certainly the first among modern writers, who endeavoured to improve upon that knowledge which, the
the ancients had left us. He describes the ascariids of the
eagle, the raven, the swan, and several other creatures, in his
work, "De animalibus vivis quo in corporibus animalium
vivorum reperturum Observationes." Ann. 1788. Some
further observations were made by different persons after the
time of Redi, but many years intervened before any consider-
able advances were made in this important branch of scien-
tific inquiry.

Although it is evident that several species of the ascariids
were most clearly ascertained before the time of Linnaeus,
that celebrated naturalist has thought proper to infer only
two species of them in his Systema Naturae, which are A.
vermicularis and A. lumbricoides. In the last edition of that
work, Gmelin has added himself of more recent discoveries,
and has augmented that number to seventy-eight: some spe-
cies have even been discovered by naturalists since the publi-
cation of that work, of which one or two is described by
Dr. Pulney in the Transactions of the Linnean society of
London for the year 1800; and there can be no just reason
to doubt, that many other kinds of them exist in different
animals, which have hitherto escaped investigation.

Prof. Pallas published an elaborate work on the ascari-
ids and other intestinal vermes, intitled "Thesiv de in-
felitis viventibus intra viventia." It was printed at Leyden
in 1762, and deservedly acquired a very distinguished reputa-
tion. In this book the author has judiciously collated
every useful information the labours of his predecessors could
afford him, as well as his own experience and observa-
tions, and has given ample descriptions and accurate spe-
cific distinctions, by which the kinds he describes may be ac-
certained.

O. F. Müller has assiduously pursued the same inquiry,
and greatly extended our knowledge of these creatures.
The royal society of Copenhagen also, aware of the vital
importance of this subject to the welfare of mankind, pro-
posed a premium for the best dissertation on the origin,
generation, and bent means of destroying the various kinds of
tentias, ascariidas, fieshale, and other parasiticus vermes, about
the year 1782. This excited the diligence both of M. Bloch
and M. Goëze, and to each of them a prize was assigned as
a reward for their labours. M. Bloch afterwards published
his dissertation in the German language, at Berlin, in 1783;
and in 1788, a translation of it into French appeared in
Strasburg, under the title of "Traité de la généra-
dion des vers des intestines et des vermis." That of
M. Goëze was published in German with forty-four illus-
trative plates, and is also a work of considerable merit and
utility.

Among the French naturalists of the present day, M.
Lamarck's "Système des animaux sans vertèbres," and
"L'Histoire naturelle des vers," a sequel to D'Arville's
edition of Buffon, are much esteemed. "In spite of the
observations of all the writers who have treated on the ascari-
des," says a modern French author, "it is to Lamarck
and Cuvier we are indebted for circumstating the number
of species within the proper limits." M. Chalmet, a man,
of acknowledged skill in the veterinary art, has also written
on the intestinal vermes; as a naturalist, it seems he has
incurred some blame; his species may however be ascertained,
and what is of equal if not greater moment is the mere
accuracy of arrangement and scientific definitions, he has
endeavoured to point out the best means of extirpating
them.

From the observations of different writers it appears,
that the ascariids are of the two sexes; and that the female
is oviparous and very prolific. All the species that are
truly ascariids, live in the stomach of man or of animals;
and their origin, which it is of the utmost consequence to
ascertain, is still a matter of profound obscurity. The three
tubercules at the head have been mistaken by fame for the
accompaniments of the vent, because there is obviously an
aperture or pore in the middle; but this is unquestionably
the mouth, and Brugière notices two little transverse openings
below, which he named figmata; and these, it is con-
jectured, are the organs of respiration.

It will be proper to observe, that besides the prodigious
number of ascariids already ascertained, there is a numerous
host of similar internal enemies peculiar to different animals
which do not profess the generical character of the ascariid,
and are therefore arranged in the new genera ichchosphalus,
filaria, uncinaris, fieshale, hyla, bronchialis, echynorhynchos,
hercules, celenus, carophyllus, linguitula, fieshale, tanta,
&c. The species of ascariids described by Gmelin are ar-
ranged in the following order:

**Insectory Man, and the Mammalia.**

Vermicularis, lumbricoides; -refertillumus, in the long-
scarved bat: -Phoece, bidita, canis, viceralis, lupi, vulpis,
leonis, tigridis, felis, cati, martis, bronchialis, renalis, me-
phitidis, gulonis, talpe, muris, hirci, vituli, equi, lys,
apri.

**Insectory Birds.**

Aquila, albicilla, buteonis, milvi, subbuteonitis, herma-
phrodita, cornicis, coracix, cygni, anatis, fuligula, lari,
ciconius, tares, papillosa, gallogavonius, galli, galling,
phani, tetronis, columna, abuads, furri, turbri.

**Insectory Reptiles.**

Telfudinis, lacerte, bufonialis, rubetras, tre-
chalis, rane, intellectalis, dyphnoos, infons.

**Insectory Fishes.**

Anguilla, marina, blemni, rhombi, perex, globica,
la-
cufalis, filii, faronis, trutta, marena, acus, halecis,
argentinis, gobionis, raja, squali, lophis.

**Insectory Worms.**

Lumbricis.

In the sequel of this article we shall confine ourselves to
the two species of ascariids that belong to the human body;
viz. the A. lumbricoides and vermicularis, referring for their
scientific characters to their specific names.

The ascariids of the first species generally infest the small
intestines; sometimes they ascend through the duodenum in-
to the stomach, and creep out of the mouth and nostrils; they
feldom descend into the large intestines, except on the exhibi-
tion of medicines increasing the action of the intestines. Some-
times they are very numerous. Dr. Hooper (to whose excellent
Paper in the Memoirs of the Medical Society of London we
are indebted for much of this detail) relates a case of a girl
eighty years old who voided per anum upwards of 220 in the
course of a week. Sometimes, however, they appear even fol-
itary. When recently excluded, they are transparent, and ap-
pear as if they had been sucking water tinged with blood;
this colour, however, soon disappears, and they become at
length of a light opaque yellow. After being evacuated, their
motion is feeble, and they soon die: sometimes, when they
have been hastily evacuated, they will be very lively, and
by means of putting them into warm milk and water, they
will continue to for some time. Their motion is serpentine,
and in no respect resembles the motion of the luminbricus
terrestris, or earth-worm, which has the power of diminish-

\[ \text{ASCARIS.} \]
ing its length and extending itself again, while the length of the ascaris lumbricoides is never diminished; the head is always sent forward by the worm curling itself into circles, and suddenly extending it with considerable force to some distance.

It is said that the ascaris lumbricoides is not hermaphrodite. The worm here described is considered as the female. Dr. Hooper says he has examined a very considerable number, and has never met with any other appearances than these.

Anatomical Description. Cuticle.—The covering or external membrane of the worm, which may be considered as the cuticle, is very strong, elastic, thin, smooth, and transparent, and only separates from the parts underneath by maceration in water; under this we find the cutis or true skin, which is considerably thicker than the former, and retains marks of the muscles which it covers; it is also very strong, elastic, and transparent. When the cutis is removed, the muscles, observable through the skin, present themselves; they do not entirely surround the worm as they at first appear, but are two distinct orders acting in opposition to each other, for the two longitudinal lines which extend from one extremity of the worm to the other, are each of them composed of two distinct tendons, separable from one another; these tendons serve for the attachment of the femoral muscles which cover the worm from the head to the tail. Upon carefully removing the femoral muscles from the head to the deflected band, a number of minute vessels are to be seen (by means of a glafs) filled with a submucous fluid which issues out upon puncturing them. This cellular or parenchymatous apparatus closely embraces the intestinal canal from the head to the deflected band; but from thence to the tail there is merely a fibrous kind of cellular membrane. When the muscles are removed from the deflected band to the tail, an extremely delicate membrane appears, which as a peritoneum embraces the abdominal vesseas, and lines the cavity of the abdomen, which cavity extends from the deflected band to the tail; it is diffused with a transparent fluid, and contains the intestinal tube, and an apparatus supposed to be subfervient to generation. The intestinal tube or canal begins from the mouth, and continues nearly half an inch in a parallel form, which Dr. Bawle calls osophagus; it then becomes larger and transparent, increasing in size till it arrives to the beginning of the abdomen, closely embraced by the parenchymatous substance; it now obtains the dimensions of a crow-quill, and pales straight, still enlarging, through the whole length of the worm to within an eighth part of an inch, where it suddenly becomes narrow, and terminates in an anus. This canal is generally filled with a greenish coloured fluid of the consistence of mucus. If a portion of this tube be macerated a few days in water, it exhibits distinct tunics, the external of which is a portion of the peritoneum; it is externally covered with filaments, which may be vesicles of nutrition. The second vescas is considered by some as peculiar to the female, and all agree it is for the purpose of generation; it begins about the middle of the worm, where the cavity of the abdomen commences by a slender tube which is continued from the punctiform aperture situated in the deflected band between the two longitudinal lines. This tube, which is termed the vagina, soon becomes larger, when it commences uterus, and divides into two large sacs, which for the space of four or five inches are of an uniform diameter, then suddenly diminish and appear like opaque threads, embracing in every direction the intestinal tube. Werner considers these as Fallopian tubes. This convoluted apparatus is composed of very fine transparent membranes; it is never found empty, but always diffused with an opaque fluid, in which are a number of ova containing young worms. Some have considered these threads (which always protrude if the skin of the worm be divided) as young worms, and have contended that the ascaris was viviparous; but it is not; and ova, similar to those found in the Fallopian tubes, will be found in the mucus surrounding the worm in the intestines.

As the ascaris lumbricoides has long been confounded with the lumbricus terrestris, or earth-worm, it may be proper to mention that the lumbricus terrestris has but one vehicle at its head, in the middle of which is its mouth; it is flat towards the tail, and is furnished with sharp bristles on its under surface that serve it for feet, which the animal can erict or depress at pleasure; its annule are very large and strongly marked, and its colour is of a dirty red. Upon the under surface there is a large femoral fold in the skin, into which the animal can draw its head or thrust it out at will; in all these it is strongly distinguished from the ascaris lumbricoides. This lumbricus has also an elevated belt in its middle, the ascaris a deflected band; on each side of the ascaris there is a longitudinal line; on the lumbricus, there are three lines upon its upper surface.

The ascaris vermicularis, called the maw or thread worm, when full grown, is about half an inch in length, and in thickness resembling a piece of fine thread; the head, or obtuse extremity, is divided into three vehicles or papillae, in whole middle is an aperture, which is the mouth. The body is about a third of the length of the animal, beginning from the head, and terminating in the tail, and is of a rigiose, pellucid, annular fabric; the tail commences at the small aperture or anus, and becomes less and less, terminating in a fine point.

These worms are mostly confined to the rectum and colon, and that principally of children; but they are often found in the cocoon and small intestines, and even the stomach, and frequently get into the vagina, and even uterus, bladder, &c. Their number sometimes exceeds all bounds; in which case the excrement, when first evacuated, appear quite alive from being covered with them; generally a small number are evacuated from the rectum every day, producing a most unpleasant sensation of itching by their piercing the skin in a degree with theirawl-shaped tails. Their constant action is one of their most flirking characters, appearing to be never at rest. On exposure to the air, they have the power of piercing the faces, and burying themselves in almost infancy. From the extreme action of this species, the genus has obtained the name ascaris, for ovcasrion signifying the same as ovnsir, falsare, inquit, mo-vere.

They are not hermaphrodite: the male does not exhibit any of the gyrate apparatus; the stomach and intestinal canal have in appearance a different arrangement from those in the female: but the male organs of generation have not been detected, probably they are too minute. The female has upon its external surface, about the eighth of an inch from the head, a small punctiform aperture through which the young are protruded, and when highly magnified, its internal cavity appears filled with the convoluted apparatus; and Dr. Hooper says he has found upwards of one hundred young ones escape through this aperture while alive, and very vivacious several hours after the death of the mother; upon a little pressure being made upon it.

Anatomical Observations. The integuments of this species are similar to those of the lumbricoid ascaris, and const
A single page of text discussing the symptoms and treatment of ascariasis, a parasitic infection caused by the nematode Ascaris lumbricoides. The text explains the internal structure of the adult worm, its symptoms, and various methods of treatment.

Symptoms of Worms: When these worms exist in any number, they produce more or less constipation, paleness of the countenance, with sometimes flushing of the face, a bluish circle about the eyes, itching of the nose, inquietude with flaring and talking during sleep, thirst in the morning, nausea and difficulty for food, though more frequently great appetite, foetid breath, pinching, gripping, and tendernefs in the belly, especially about the navel; belly frequently much enlarged, flatus, colic sometimes at other times purging, weakness, languor, epileptic fits, and more or less symptomatic fever, pulse weak, and sometimes intermitting. These symptoms arise more from the lumbricoïdes than the vermicularis; but where the latter are numerous, they will occasion nearly as violent symptoms; otherwise they are more known by their effects in and about the rectum and its neighbourhood, producing itching there more or less intolerable, with tenesmus, and even fatal abuses. There are a number of other symptoms brought on by the existence of worms; these, however, are the principal and most decisive; but the best and most satisfactory evidence is their being seen in the evacuations.

Cure: The indications for the cure of ascariases are of two kinds; first, the expulsion of them, their young, their ova, and the mucus containing them, from the bowels; and second, the correction of that weak state of the bowels, or other morbid dispositions of them, whatever they may be, which favour the production of them, and that mucus which becomes a nidus for their propagation. For although the only place in nature where these two species of infects are known to be generated, is the human intestines, during life, and therefore it might be reasonable to suppose, they might exist in them (not in great numbers) in a state of health, yet they are generally found in them when at least in a state of lefis vigour, as in infancy and age, or when weakened by any external means, among the caufes of which (it may be proper to mention here) the drafle purgatives, employed to get rid of them. These frequently weaken so much that the patient rather submits to the inconvenience of them, especially the ascariases vermicularis, than to the pernicious effects of vermifuges upon the digestive organs.

There is hardly a purgative, especially among the drauffe ones, which has not been employed for this purpofe. They should be used with every precaution; and are hardly ever necessary for the expulsion of the acarcides. The lumbricoïdes is not very tenacious of life, and is easily defroyed and evacuated by means of colonel, with fcanmony or jalap, and other milder purgatives, in moderate doses, adapted to the strength of the patient. The purgative should be several times repeated, at short intervals, in order to remove such worms and ova as have been screened by the foads of the intestines, or in the mucus, from the action of the preceding dose. The same means are employed to remove the acarcides vermicularis, but not with the fame facilities. This is much more tenacious of life, and as it is generally located far from the defomach, medicines administered by the mouth have little other effect upon it than as they evacuate the contents of the rectum in common with the other vifcera; but administered by glyfter, the relief they afford is very con- siderable, though not in all cafes certain. A small quantity of aloes, diffolved in some inodorous fluid, and employed as a glyfter, is very powerful in this way, affiited at the fame time by medicine, to evacuate them from above. There are cafes where no effectual remedy has been found to remove these troublesome vermin. We shall below tranfcribe the accurate history of a cafe of these worms, given by the late Dr. Heberden, in the first volume of the Medical Transactions, which will greatly illustrate this part of our subjed.

The second indication of cure, the removal of that weak and morbid state of the intestines which proves favourable to the generation of the acarcides, is by no means the leat; and it is on this principle perhaps only that bitters have been ranked with worm medicines: it is hardly probable that infects always bred in bitters, and which have been found in the dukes communis cholechochus, and even gall bladder, should be poisoned by bitters. Bitters, and tonics, as preparations of feel and other mineral and vegetable tonics, will be found nearly as useful as the medicines which simply expel them. The consideration of other remedies employed in the removal of worms, we must refer to the article TANIA.

Dr. Heberden tells us, that being acquainted with an experienced and intelligent physician, who had from his infancy been troubled with ascariases, he defired to be informed by him what were the inconveniences which they had occasioned, and what was the ufe of the remedies which the defired. was to this end; that according to his experience, the peculiar symptoms of this species of worms are a great uneafiness in the rectum, and an almost intolerable itching of the anus. These defections usually come on in an evening, and prevent sleep for feveral hours; they are attended with a heat, which is sometimes fo considerable as to produce a swelling in the rectum, both internally and externally; and if these symptoms be not soon relieved, a tenesmus is brought on with a mucus dejection. Sometimes there is a gripping pain in the lower part of the abdomen, a little above the pubis. If this pain be very feeve, there follows a bloody mucus, in which there are often found ascariases alive. They were sometimes suspected of occasioning di- turbed sleep, and some degree of head-ache. Purgings and irritating cyflets were injected with very little success. One dram and a half of tobacco was inifed in five ounces of boiling water, and the strained liquor being given as a cyflet, occasioned a violent pain in the lower part of the abdomen, with faintnefs and a cold sweat. This infecfion, though retained only one minute, acted as a smart purger, but did little or no good. Lime water was also used
as a clyster, which brought on a coffeeenis, but had no good effect. Six grains of salt of rhubarb were dissolved in six ounces of water, and injected. This clyster in a few minutes occasioned an aching in the rectum, and gripped a little, without purging, and excited a tenesmus. Some few aferidies were brought off with it, but all of them were alive. The uneazy fermentation occasioned by this clyster did not abate till some warm milk was thrown up. Wherever the tenesmus or mucus flowed the worth worth taking notice of, warm milk and oil generally gave immediate relief. If purging was necessary, the lewest purges, such as manna, with oil, were in this case made use of; rhubarb was found too stimulating. But, in general, the most useful purge, and which therefore was most usually taken, was cinnamon and rhubarb, of each half a drachm: this powder seldom failed to bring away a mucus as transparent as the white of an egg, and in this many sacrifies were moving about. The cinna-

bar frequently adhered to this mucus, which did not come off in such large quantities, when a purge was taken without the cinnabar. Colonel did no more than any other purge, which precipitates briskly, would have done; that is, it brought away aferidies, with a great deal of mucus. Oil, given as a clyster, has sometimes brought off these animacules; the oil swam on the surface of the mucus, and the sacrifies were alive moving in the mucus, which probably hindered the oil from coming in contact with them and killing them. The same mucus may reasonably be supposed to preserve these worms unheal, though surrounded with many other liquors, the immediate touch of which would be fatal. If the sacrifies be taken out of their mucus, and exposed to the open air, they become motionless, and feem to die in a very few minutes.

The general health of this patient did not seem to have at all suffered by the long continuance of his disorder, nor the immediate inconveniences of the disorder itself to have increased. It is perhaps universally true that this kind of worm, though as difficult to be cured as any, is yet the least dangerous of all. They have been known to accompany a peron through the whole of a long life, without any reason to suspect that they have hattened its end. As in this example, there was no remarkable sickness, indigestion, pain of the stomach, giddiness, nor itching of the nose, possibly these symptoms, where they have happened to be joined with the sacrifies, did not properly belong to them, but arose from other causes. There is indeed no sign of worms, but what in some patients will be wanting. From this cely further appears, that mucus or slime is the proper seat of the sacrifies, in which they live, and perhaps the food by which they are nourished. It is hard to satisfy ourselves by what instinct they find it out in the human body, and by what means they get at it; but it is observable in many other parts of nature as well as here, that where there is a fit foil for the hatching and growth of animals and vegetables, nature has taken sufficient care that their feed should find the way thither. Worms are said to have been found in the intestines of infants who have been born dead. Purges, by lessening this slime, never fail to relieve the patients; and it is not unlikely that the worms which are not forced away by this quickened motion of the intestines may, for want of a proper quantity of it, languish, and at last die. Experience furnishes no objections against supposing that the kind of purge is of little moment in the cure of all other sorts of worms as well as of the sacrifies, the worms being always defended from the immediate action of medicines; and that therefore those purges are the best which act briskly, and of which a frequent repetition can be most sally borns.

Purging waters are of this kind, and jalap, especially for children; two or more grains of which, mixed with sugar, are easily taken, and may be daily repeated.

ASCAROIDES, a species of Cucullanus found in the flomach of the Silurus glan/us; it resembles the larva of the mufca, is about an inch in length, of a whitish grey colour, and is gregarious. Goëze and Gmel. thus define its specific character: head orbicular, and hooked on each side; tail rounded, short, and pointed with two exserted fipules.

ASCALUS, in Ancient Geography, a town of Ger-

many. Ptolem.;

ASCALUS, in Ancient Mufic, a wind instrument, con-
cerning which musical antiquaries are not agreed; but it is
genearly supposed to be synonymous with the tibia articu-
laris, or borg-hofte: which fee.

ASCULUS, in Geography, a town of Venetia, north-
well of Tavilion.

ASCENDANT, in Astrology, denotes the harcope; or the ecliptic which lies upon the horizon, at the time of the birth of any one. This is supposed to have an influence on the person’s life and fortune, by giving him a bent and propensity to one thing more than another. In the celestial theme this is called the first house, the angle of the north, or oriental angle, and the regulator of life.—Such a planet ruled in his ascend. —Jupiter was in his ascend. &c.

Hence the word is also used in a moral sense, for a certain superiority which one man has over another, from some unknown cause.

ASCENDANT, in Genealogy, is underflow of ancestors, or such relations as have gone before us; such are father, grandfather, &c.—They are thus called in contradistinction to descendants, or the defending line. It is a canon in law, that inheritances never linearly ascend.

ASCENDANT, in Anatomy, is applied to such vessels as carry the blood upwards; thus part of the aorta, and the inferior cava, have been termed the ascending aorta, and ascending cava.

ASCENDANT, in Botany, denotes growing first horizontally, and then bowed upwards; and the term in this sense is applicable to leaves, to italks, to stems, as in spik’d weedwell; or to flamos, as in all the speedweeds.

ASCENDANT, in Astronomy, is underflow of the stars or degrees of the heavens, &c. which are rising above the horizon, in any parallel of the equator.

ASCENDANT, in Astronomy, is underflow of those stars or degrees of the heavens, &c. which are rising above the horizon, in any parallel of the equator.

ASCENDANT, in Astronomy, is underflow of those stars or degrees of the heavens, &c. which are rising above the horizon, in any parallel of the equator.

ASCENDANT, in Astronomy, is underflow of those stars or degrees of the heavens, &c. which are rising above the horizon, in any parallel of the equator.

ASCENDANT, in Astronomy, is underflow of those stars or degrees of the heavens, &c. which are rising above the horizon, in any parallel of the equator.

ASCENDANT, in Astronomy, is underflow of those stars or degrees of the heavens, &c. which are rising above the horizon, in any parallel of the equator.

ASCENDANT, in Astronomy, is underflow of those stars or degrees of the heavens, &c. which are rising above the horizon, in any parallel of the equator.
Apocryphal Constitutions, 1. v. c. 19. Its origin is not known; and hence none have been led to imagine, that it was received by tradition from the apostles.

Ascension, in astronomy, is either right or oblique.

Ascension, right, of the fun, or of a star, is that degree of the equinoctial, accounted from the beginning of Aries, which rises with the fun, or star, is a right sphere. Or, right ascension is that degree and minute of the equinoctial, counted as before, which comes to the meridian with the fun, or star, or other point of the heavens. The reason of thus referring it to the meridian, is, because it is always at right angles to the equinoctial, whereas the horizon is only so in a right or direct sphere. The right ascension stands opposed to the right ascension, and corresponds to the longitude of places on the earth. Two fixed stars, which have the same right ascension, i.e. that are at the same distance from the first point of Aries, or, which amounts to the same, are in the same meridian, rise at the same time in a right sphere, or with respect to people who live under the equator. If they be not in the same meridian, the difference between the times of their rising or coming to the meridian is the precise difference of their right ascension. In an oblique sphere, where the horizon cuts all the meridians obliquely, different points of the meridian never rise or set together; so that two stars, on the same meridian, never rise or set at the same time; and the more oblique the sphere, the greater is the interval of time between them. To find the right ascension of the fun, stars, &c. trigonometrically, say, for the fun, as radius is to the cofine of the fun's greatest declination, or obliquity of the ecliptic, so is the tangent of the fun's longitude to the tangent of the right ascension.

Let PESQ (Astronomy, Plate II. fig. 15.) represent the folliellular circle, the centre of which is \( \gamma \), and let the diameter \( EP \) be the equator and the diameter \( PS \) be the equinoctial circle. Suppose the obliquity to be \( \varepsilon = 23^\circ 28' \), and the diameter \( \omega \), the ecliptic, in which take \( \gamma \), for the fun's longitude or distance from the point \( \gamma = 43^\circ 16' \); and through \( P \), describe a circle of right ascension. Then in the right-angled spherical triangle \( \gamma P \beta \), we have

**Radius**

| to t. fun's long. = 43° 16' | 9.97371 |
| As cof. obl. ccl. = 23° 28' | 9.96251 |
| to t. right ascension = 46° 48' | 9.93722 |

While the fun is moving from \( \gamma \) to \( \omega \), or in the first quadrant of the ecliptic, the given longitude is the hypotheneuse in the triangle \( \gamma P \beta \), the declination \( B \) is north, and \( \gamma P \beta \) is the right ascension. When the fun has passed the folliell \( \varepsilon \), and is descending towards \( \gamma \), or in the second quadrant, his longitude or distance from \( \gamma \) being taken from \( 180^\circ \), the remainder \( \gamma \) becomes the hypotheneuse, and the declination is still north; but the arc \( B \) found for the right ascension is only the supplemement, and must therefore be taken from \( 180^\circ \). The fun having paffed the peff 

\[
\begin{align*}
\text{A} + \text{O} &= \text{B} \\
\text{A} + \text{O} &= \text{B} + \text{E} \\
\text{A} + \text{O} &= \text{B} + \text{E} + \text{F} \\
\end{align*}
\]

The right ascension and declination of a fixed star or planet, whose longitude and latitude, as well as (O) the obliquity of the ecliptic, are given, may be found by the following problem, communicated by Dr. Mattheus to Dr. A. Mackay.

Tan. lat. — fine long. = tan. A, north or south, as latitude.

Call. O north in fix first signs, and south in fix last signs.

A + O = B

A less than 45°, co. ar. co. A + cof. B + tang. long.

A more than 45°, tang. A + co. ar. fine A + cof. B = + tang. long.

If the right ascension of the given kind as longitude; unless B be more than 90°, when the quantity found of the same kind as longitude must be subtracted from 12 signs.
AR (right ascension) nearer III and IX signs than o and VI signs, then $\text{AR} + \tan \beta$

AR nearer o and VI signs than III and IX signs, then $\tan \alpha \cos \beta$

tang. declination of fame title as B, true to the nearest second by Taylor's logarithms, to nearest 10" by Gardiner's logarithms, or to nearest minute by Sherwin's or Hutton's logarithms, without proportioning.

Example.

Let the moon's long. be 7° 14' 26" 21", and lat. 4° 0' 34" N., and the obliquity of the ecliptic 23° 27' 48". Required the right ascension and declination?

Lat. $\Gamma 4^\circ 0' 34"$, tang. 8.8456713.

Long. 223 26 21 fine 9.8451920; tang. 9.9914974.

$A = 5^h 4^m 6^s$ tang. 9.0004793 ar. cos. o. 0.0021654.

$O = 23^h 27' 48"$. N. B. The right ascension and declination may be found by the following formulae:

Co. f. Decl. = $\varphi$. f. Long. a. $\varphi \times f$. co. lat. $\times f$. ob. ecl. + v. f. co. lat. $\times f$. ob. ecl.

Co. Right ascension from $\varphi$ or $\alpha$ =

The practical method of finding the right ascension of a body from that of a fixed star, by a clock adjusted to sidereal time, is this:—Let the clock begin its motion from o to 0" at the instant the first point of aries is on the meridian; then, when any star comes to the meridian, the clock would show the apparent right ascension of the star, the right ascension being estimated in time at the rate of 15° an hour, provided the clock was subject to no error, because it would then show at any time how far the first point of aries was from the meridian. But as the clock is liable to errors, we must be able at any time to ascertain its error, or the difference between the right ascension shown by the clock and the right ascension of that point of the equator which is at that time on the meridian. To do this, we must, when a star, whose apparent right ascension is known, passes the meridian, compare its apparent right ascension with the right ascension shown by the clock, and the difference will show the error of the clock. 

The arc of right ascension is that portion of the equator intercepted between the beginning of aries, and the point of the equator which is in the meridian; or, it is the number of degrees contained in it. This coincides with the right ascension itself. The right ascension is the same in all parts of the globe.

We sometimes also say, the right ascension of a point of the ecliptic, or any other point of the heavens. The right ascension of the mid-heaven is often used by astronomers, particularly in calculating eclipses by the nonaginal degree; and it denotes the right ascension of that point of the equator which is in the meridian, and is equal to the sum of the sun's right ascension and the hour angle or true time reduced to degrees, or to the sum of the mean longitude of the sun and mean time.

Ascension, angle of right. See Angle.

Ascension, oblique, is an arc of the equator intercepted between the first point of aries, and that point of the equator which rises together with a star, &c. in an oblique sphere.

The oblique ascension is numbered from west to east; and is greater or less, according to the different obliquity of the sphere.

To find the oblique ascension of the sun by the globe, see Globe. See also Ascensional Difference.

The arch of oblique ascension is an arc of the horizon intercepted between the beginning of aries, and the point of the equator, which rises with a star or planet in an oblique sphere. This coincides with the oblique ascension itself.

The oblique ascensions change according to the latitude of the place.

Ascension and Declension, Refraction of. See Refraction.

Ascension, isf of, in Geography, one of the African islands situate in the Southern Atlantic ocean. S. lat. 9° 56' 30". W. long. 14° 22' 31".

This dreary desolate island was first discovered in 1501, by J. de Nova Galego, a Portuguese navigator, who called it "Ilha de Nossa Senhora de Conceição;" and it was seen a second time by Alfonso d'Albuquerque, on his voyage to India in 1523, probably on Ascension-day when it received its present name. Capt. Cook stopped at this island in 1775; and he says that it is about ten miles in length, from north-west to south-east, and about five or six in breadth. Its surface is composed of barren hills and valleys, or a collection of rocks and hollows, without a shrub or plant for several miles, and exhibiting by the stones and ashes which abound in it, sufficient evidence that at some period or other it was a volcanic production. Mr. Forster, in his account of this island, says, that they could discern from the ship, near the centre of it, a broad white mountain of considerable elevation, on which there was some verdure, and from this circumstance it obtained the name of the "Green Mountain." When they landed on the beach, through a high surf, they found themselves amid vast rocks, which consisted of minute shell-sand, chiefly of a snowy white, deep and dry, and by the reflection of the sun intolerable to the eyes. In their progress, they ascended through heaps of block cavernous stone, which perfectly resembled the common lavas of Vefuvius and Iceland. After a perpendicular ascent of about twelve or fifteen yards, they arrived at an extensive level plain, about five or eight miles in circuit, at the different corners of which they observed large hills, of a conical shape, and of a reddish colour, which were perfectly intimated. Between these hills the plain was covered with a great
great number of small hillocks, composed of lava similar to that which they found on the sea-shore, and the pieces of which founded like glass when struck against each other. Between the heaps of lava the soil was a firm black earth, and where the heaps did not appear, the whole was a red earth, so loose and composed of such minute particles, that the wind raised from it clouds of dust. The conic hills consisted of a different sort of lava, which was red and bright, and crumbled into earth. One of these hills stands directly in front of the bay, and has on its summit a wooden cross, whence the bay is said to take its name. The sides of the hill are very steep, but a path about 1/2 of a mile long winds to the summit. The plain on which the hill is situated, they concluded to have been once the crater of a volcano, by the accumulation of whole cinders and pumice stones the conic hills had been gradually formed; the currents of lava which were now distributed in many heaps, had, as they conjectured, been gradually buried in fresh cinders and ashes; and the waters flowing from the interior mountain in the rainy season, had carried every thing before them, and thus filled up by degrees the cavity of the crater. The rocky black lava was the residuum of numberless men-of-war birds, and boobies, which sat on their eggs and allowed of a close approach. Here they found a New York sloop, which came to the island to catch turtles, in order to sell them at the Windward islands. The East India ships, it is said, touch at this island for the purpose of furnishing themselves with turtles, which are plentiful and very large. On a second visit to the island, Mr. Forster and his companions crossed the plain, and arrived at a prodigious current of lava, intersected by many channels from fix to eight yards deep, which appeared to have been formed by torrents of water, but which they found dry, as the sun was in the northern hemisphere. In their gullies they perceived a small quantity of soil which was a black volcanic earth mixed with some whitish particles, that were gritty to the touch. This soil afforded sufficient nutriment to purfana, and a species of grass, the "panicum fanguineum." Having with difficulty climbed over this lava current, they came to the foot of the "green mountain," which was surrounded by a lava, that was covered with purfana, and a kind of new fern, "lunaria adeniophora," on which several wild goats were feeding. This mountain is divided in its extremities by various cliffs into several bodies, which run together towards the centre, and form one broad mass of great height. The whole appears to consist of a gritty topahoeus limestone, which has never been attacked by the volcano, but probably existed, as Mr. Forster supposed, prior to its eruption: its sides are covered with a kind of grass peculiar to the island, which Linnaeus has named "aridita adeniophora." The goats which feed on it were very numerous, but being very shy, they fled with great velocity over tremendous precipices, where it was impossible to pursue them. This island, with a little trouble, says this writer, might in a short space of time be rendered fit for the residence of men. The introduction of furze, "aulx Europae," and some other plants which thrive best in a parched soil, and which are not likely to be attacked by rats or goats, would soon have the same effect as at St. Helena. The moiture attracted from the atmosphere by the high mountains in the centre of the island, would then not be evaporated by the heat of the sun, but gradually be collected into rivulets, and supply the whole island. A bed of grasses would everywhere cover the surface of the ground, and annually increase the flatus of the mould, till it could be planted with more useful vegetables. The outsports of the island are represented to be beyond description dreary.

It is said that, as this island is visited by the homeward-bound ships on account of its sea-fowls, fowl, turtle, and goats, there is in the crevice of a rock a place called by the sailors the "Poit Office," where letters are deposited, shut up in a well corked bottle, for the ships that next visit the island. Mod. Uni. Hist. vol. xi. p. 458.

ASCENSION, or Ascension, Isle of, a small island about 120 leagues east from the coast of Brazil, N. lat. 25° 30'. W. long. 33° 40'. Some have supposed this island to be the same with the Isle of Trinidad or Trinity, M. le Perouze, who wished to ascertain the existence of the island of Ascension, made search for it, and aetas (see his voyage, vol. i. p. 24.) that no such island exists from the meridian of Trinidad to about seven degrees west longitude, between the latitudes of 20° 10', and 25° 30'. M. le Pautre d'Augelet also suspects (Mem. Acad. Sc. Paris, for 1788) the French geographers have committed an error with regard to the Isle of Trinity, which they have laid down in their maps of the African seas, but which he thinks is really the Isle of Ascension, which, by some error of reckoning, occasioned probably by currents, has been twice laid down. But M. Dapres (Neptune Oriental, p. 10.) has placed the island of Ascension 100 leagues west of Trinidad, and fifteen miles to the southward. It appears also, that though the latitudes of these two islands were nearly the same, their latitudes were very imperfectly ascertained; and from the minute and very different plans which Dalrymple has given of these two islands and their appearance, it is presumed that they are not the same. La Perouze did not pursue his researches far enough, as the Isle of Ascension is probably somewhat nearer the coast of Brazil than Dapres has placed it.

ASCENSION BAY, lies on the east side of the peninsula of Yucatan, in the bay of Honduras, having Amber bay on the north, and the northern point of Ambergris Key on the south, which forms a passage into Hanover bay, south from Ascension bay.—Also, a bay in the north part of the gulf of Mexico, situate between Cape Balize at the mouth of the Mississippi, and the bay of Fresh-water on the west, in N. lat. 35°, and W. long. 92°.

ASCENSIONAL Differences, in Astronomy, is the difference between the right and oblique ascension of the same point on the surface of the sphere.

To find the ascensional difference trigonometrically, having the latitude of the place, and the sun's declination given, lay, As radius is to the tangent of the latitude, so is the tangent of the sun's declination to the sine of the ascensional difference.

E. G. Let it be required to find the sun's ascensional difference at London, lat. 51° 32' N. on the 21st of June, being the longest day, when the sun's declination is 23° 28' N.

Let the primitive circle PESQ (Astron. Pl. II. fig. 17.) represent the meridian of the place, and the diameter HR the horizon; take RP from R, the north point, for the latitude = 51° 32'; draw the axis, or 6 o'clock hour circle, PS, and perpendicular to it draw the equator EQ; make En, QM, each = 23° 28', the declination, and describe the parallel of declination TMS, intersecting the horizon in O, the place of the sun at his rising or setting, and through this point describe the hour circle POS.

In the spherical triangle AOA', right-angled at A, the angle QPR, measured by the arc OR, is the co-latitude; A'O is the sun's declination; and the required ascensional difference is A'A, which may be found by the proportion above stated; viz.

Rad.
ASC

Rad. 
To t. lat. P^\circ \theta = 51^\circ 32' 
As t. decl. A^\circ = 23^\circ 26' 
To find ate. diff. \phi' \theta = 33^\circ 7' 

This ascensional difference 23^\circ = 7', converted into time, gives 211 12' 28" for the time which the fun rides before, and sets after the hour of fix, on the longest day. Hence it appears, that when the latitude and declination have the same name, the fun rides before, and sets after fix; but when they are of contrary names, the fun rides after, and sets before fix. And as the fun describes the parallel of declination in 24 hours, being at n when it is noon, and s when it is midnight, the time in passing from n to s, or the time of rising being doubled, gives the length of the right; and the time of setting being doubled, gives the length of the day. Consequently, 6° + 2° 12' 28" = 8° 12' 28", will be the time of setting; and 6° - 2° 12' 28" = 3° 47' 32", will be the time of rising; and \(8 \times 12' 28" \times = 16' 24' 56"\) the length of the day, and \(3^\circ 47' 32" \times 2 = 7^\circ 55' 44"\) the length of the night.

But when it is the shortest day at London, that is, when the sun has 23° 28' south declination, the lengths of the day and night will change places; the day being 7° 35' 44", and the night 16° 24' 56".

When the latitude and declination have the same name, the difference between the right ascension and the ascensional difference, is the oblique ascension; and their sum is the oblique declension; but when they are of contrary names, the sum is the oblique ascension, and the difference is the oblique declension.

The above solution is applicable to a star, as well as to the sun; but on account of the small change in the declination of the stars, the fun stars in any latitude may be considered as having the same ascensional difference through the year. Hence it appears that the diurnal difference of the same star's rising, culminating, and setting in the same latitude, is nearly equal to the diurnal difference of the fun's right ascension. As the sun's mean apparent daily motion is 59' 8" nearly, or in time 3° 36' 32", this will be the daily difference in the rising, setting, and passing of any fixed star in the same latitude.

ASCENSIONIS, in Ichthyology, a species of PERCA, which inhabits the sea about Ascension island; it is reddish above, whitish beneath, and the tail is bifurcated. Obs. 11. P. 388.

ASCENSORIAM sometimes occurs, in our ancient writers, for a fator or fip.

ASCENT, in a general sense, the motion of a body tending upwards; or the continual recedes of a body from the earth. In this sense the word stands opposed to descent. The Peripatetics attribute the spontaneous ascent of bodies, to a principle of levity inherent in them. The moderns deny any such thing as spontaneous levity, &c. that whatever ascends, does it in virtue of some external impulse or extrusion. Thus it is that incoke, and other rare bodies ascend in the atmosphere; and oil, light woods, &c. in water; not by any internal principle of levity, but by the superior gravity, or tendency downwards of the parts of the medium in which they are.

The ascent of light bodies in heavy mediums is produced after the same manner as the ascent of the lighter scale of a balance. It is not that such scale has an internal principle by which it immediately tends upwards; but it is impelled upwards by the preponderancy of the other scale, the excess of the weight of the one having the same effect by augmenting its impetus downwards, as so much real levity in the other; because the tendencies mutually oppose each other; and that action and reaction are always equal. See this further illustrated under the article Specific Gravity, and Fluid.

ASCENT of Bodies on inclined Planes. See its doctrine and laws, under Inclined Planes.

ASCENT of Fluids, is particularly understood of their rising above their own level, between the surfaces of nearly contiguous bodies, or in slender capillary glass tubes, or in vessels filled with fluid, &c., or the like porous substantias. This effect happens as well in vacuo, as in the open air, and in crowded as well as straight tubes. Some liquids, as spirit of wine, and oil of turpentine, ascend with greater velocity than others; and some rise after a different manner from others. Mercury does not ascend at all, but rather subsides. The phenomenon, with its causes, &c., in the instance of capillary tubes, will be spoken of more at large under CAPILLARY TUBE. Upon the same principle, two smooth polished plates of glass, metal, stone, or other matter, being so disposed as to be almost contiguous, have the effect of several parallel capillary tubes; and the fluid rises in them accordingly: the like may be said of a vessel filled with fluid, &c., the divers little interstices of which form a kind of capillary tubes. So that the same principle accounts for the appearance in them all. And to the same may probably be ascribed the ascent of the sap in vegetables. Thus Sir I. Newton—When a large pipe of glass be filled with sifted ashes, well pressed together, and one end dipped into flagrant water, the fluid will ascend slowly in the ashes, so as in the space of a week or fortnight to reach the height of thirty or forty inches above the flagrant water. This ascent is wholly owing to the action of those particles of the ashes which are upon the surface of the elevated water; those within the water attracting as much downwards as upwards; it follows that the action of such particles is very strong; though being less dense and close than those of the glass, their action is not equal to that of glass, which keeps quicksilver suspended to the height of sixty or seventy inches, and therefore acts with a force which would keep water suspended to the height of about forty feet. By the same principle, a sponge suckes in water; and the gills of the bodies of animals, according to their several natures and dispositions, imbibe various juices from the blood. Optics, p. 367.

If a drop of oil, water, or other fluid, be laid on a glass plane, perpendicular to the horizon, so as to stand without breaking or running off; and another plane inclined to the former so as to meet a top, be brought to touch the drop, then will the drop break, and ascend towards the touching end of the planes; and it will ascend the faster in proportion as it is higher, because the distance between the planes is constantly decreasing. After the same manner, the drop may be brought to any part of the planes, either upward or downward, or sideway, by altering the angle of inclination. Lastly, if the plane perpendicular planes be so placed, as that two of their sides meet, and form a small angle, the other two only being kept apart by the interposition of some thin body, and thus immersed in a fluid tinged with some colour; the fluid will ascend between the planes, and this the highest where the planes are nearest; so as to form a curve line, which is found to be a just hyperbola, one of the asymptotes whereof is the line of the fluid, the other being a line drawn along the touching fides. The physical cause, in all these phenomena, is the same power of attraction. See HYDROSTATICS (Pl. 1, fig. 1.), and Cohesion.
ASC

ASCENT of vapour. See EVAPORATION, CLOUD, and VAPOUR.

ASCENT, in Astronomy. See ASCENSION.

ASCENT, in Logic. denotes a kind of argumentation, wherein we rise from particulars to universals. As when we say, this man is an animal, and that man is an animal, and every other man, &c., therefore, every man is an animal.

ASCESIS properly denotes exercise of the body. It is formed from the verb *ascinos*, used by the ancients in speaking of the sports and combat of the athletes.

ASCESIS is also used by philosophers to denote an exercise conducive to virtue, or to the acquiring a greater degree of virtue. Buddeus has a dissertation on this philosophical subject.

ASCETERIUM, in Ecclesiastical Writers, is frequently used for a monastery, or a place set apart for the exercises of virtue and religion. The word is formed from *a*bis, "exercise," or *affectus*, one who performs exercise. Originally it signified a place where the athletes, or gladiators, performed their exercises.

ASCETIC, derived from *ascinos*, "I exercise," an ancient appellation given to those persons as in the primitive times, devoted themselves more immediately to the exercises of piety and virtue in a retired life; and particularly, to prayer, abstinence, and mortification. Moench (Eccle. Hist. vol. i. p. 129) traces the origin of this sect in the Christian church to the second century. He says, that the ascetics owed their rise to certain Christian doctors, who maintained, that Christ had established a double rule of sanctity and virtue, for two different orders of Christians: the one was ordinary, and designed for persons in the active scenes of life; the other extraordinary, and more sublime, and intended for those who, in a sacred retreat, aspired after the glory of a celestial fate. Accordingly, they distributed those moral doctrines which they had received either by tradition or writing into the two classes of precepts and counsels; the former being universally obligatory upon all orders of men, and the latter, relating to Christians of a more sublime rank, who proposed to themselves great and glorious ends, and breathed after an intimate communion with the Supreme Being. The effects of this latter description declared their resolution of obeying all the counsels of Christ, in order to their enjoying communion with God here; and also that, after the dissolution of their mortal bodies, they might ascend to him with the greater facility, and find nothing to retard their approach to the supreme centre of perfection and happiness. They looked upon themselves as prohibited the use of things which other Christians were allowed to enjoy, such as wine, flesh, marriage, and commerce. See Athenagoras, Apol. pro Chriff. c. 28. They thought it their indispensible duty to exterminate the body by watchings, abstinence, labour, and hunger. They sought felicity in solitary retreats, and in desert places, where, by severe and arduous efforts of sublime meditation, they raised the soul above all external objects and all sensual pleasures. Both men and women implored upon themselves the most ayverse discipline, which, though at first it was the fruit of pious intention, proved in the issue extremely detrimental to Christianity. These persons were called *affectus*, *exilantia* Ecclées, and philosophers; nor were they distinguished from other Christians merely by their appellation, but also by their garb. In this century, such as embraced this kind of austere life, contented themselves with submitting to all these mortifications in private, without breaking alms their social bonds, or withdrawing themselves from intercourse with mankind. In the next century, and particularly in the

regain of Constantine, these ascetics, who, as an elegant historian describes them, (Gibbon's Hist. vol. vi. p. 239.) "obeyed and abused the rigid precepts of the gospel, and were inspired by the savage enthusiasm which represents man as a criminal, and God as a tyrant," fled from a profane and degenerate world to perpetual solitude, or religious society, and assumed the name of "Hermit," or "Monk," and "Anachoretus," expressive of their lonely retreat in a natural or artificial desert. The reasons which gave rise to this austere sect are sufficiently obvious. One of the principal was, the ill-judged ambition of the Christians to resemble the Greeks and Romans, many of whose fages and philosophers distinguished themselves from the generality, by their maxims, by their habits, and, indeed, by the whole plan of life and manners which they had formed to themselves, and by which they acquired a degree of esteem and authority. Of all these ancient philosophers, there were none whose sentiments and discipline were so well received by the ancient Christians, as those of the Platonists and Pythagoreans, who preferred in their leisures two rules of conduct, one for the sage who aspired to the sublimest heights of virtue, and another for the people involved in the cares and agitation of an active life. As the opinions of some of these latter persons were adopted by the more learned among the Christians, they were naturally led to embrace also the moral discipline which resulted from them. Some of the religious fervors to which they were led were deduced from the genius and temper of the people by whom they were first practised. This morose discipline originated in Egypt, which abounded with persons of a melancholy complexion, and produced, in proportion to its extent, more gloomy spirits than any other part of the world. Here the Effenes and Therapeutae, those dismal and gloomy sects, principally dwelt, long before the coming of Christ, and also many of the ascetic tribe, who, led by a certain melancholy turn of mind, and a defulve notion of rendering themselves more acceptable to the Deity by their austerity, withdrew themselves from human society, and from all the innocent pleasures and comforts of life. From Egypt this four and inoffensive discipline passed into Syria and the neighboring countries, and was adopted by persons of the same dismal constitution with that of the Egyptians; and from thence, in process of time, its infection reached to the European nations. Hence sprung that train of austerities and superflitious rites, that yet, in many places, cast a veil over the beauty and simplicity of the Christian religion. Hence the celibacy of the priestly order, the rigour of unprofitable penances and mortifications, the innumerable fasts of monks that withdrew their talents and labours from society, and who did this in the f eas of a visionary pursuit of a visionary fort of perfection. Hence also proceeded the distinction between the theoretical and mystical life, and many other fancies of a similar kind. The ascetics acquired the respect of the world, which they despised; and the loudest applause was bestowed on this "divine philosophy," as it was called, which suffused, without the aid of science or reason, the laborious virtues of the Grecian schools. When the monks came in fashion, the title of ascetic was bellowed upon them; especially upon such of them as lived in solitude. See HERMIT, and MONK.

ASCETIC is also a title of several books of spiritual exercises; as, the *Affectes* or devout treatises of St. Basil, archbishop of Caesarea in Cappadocia. We also say the ascetic life, meaning the exercise of prayer, meditation, and mortification.

A-SCHACH, in Ornithology, the name by which the...in the...
LANIUS SCHACH OF LINZA, OR Chiche Shrieve, is called in
China, and under which it is described by Otbeck, Voy. p. 227.
See Lanius Schach.

ASCHAFFENBURG, a town of Germany, in the
circle of Franconia and bishopric of Wurzburg, thirty-two
miles north of Wurzburg.

ASCHAFFENBURG, a town of Germany, in the
circle of the Lower Rhine, which runs into the Mayne near Stock-
stadt.

ASCHAM, Roger, in Biography, an English scholar
of distinguished reputation, was born at Kirby-Wiske, near
North-Allerton in Yorkshire, about the year 1515, of parents who,
having lived together for sixty-seven years, with uninterrupted harmony, died at the same hour of the same day.
Having discovered very promising talents at an early age, he
was taken under the patronage of Sir Anthony Wingfield, and
after making considerable progress in classical literature
under the instruction of the domestic tutor of his sons, As-
cham was removed by his patron, in 1530, to St. John's col-
lege at Cambridge. Here he enjoyed peculiar advantages
for improvement, under the tuition of two persons who were
eminent for literature at a period when the study of the
Greek and Roman classics was the object of particular at-
tention. Of these advantages he availed himself with in-
gular dili dence and emulation; and his proficiency was so con-
fiderable, that he gained very distinguished reputation in the
university at a very early age. In order to perfect himself in
the Greek language, he taught it to others; and learning
very soon to discriminate with regard to the comparative ex-
cellence of different authors, he lost no time in the pursuit
of mean or unprofitable books. Upon the model of Cicero
and Caesar, whose works he diligently studied, he formed
his style; and among the philosophers he selected Plato and
Aristotle; among the historians, Thucydides and Herodotus;
and among the orators, Demosthenes and Isocrates; and on
these two last authors he read lectures to his pupils, as he
also did on the most celebrated of the Greek poets. At
the age of eighteen, in 1534, he took his degree of bachelor
of arts, and soon after in the same year was elected fellow of
his college, though his attachment to the reformed reli-
gion raised some obstacles in the way of this appointment.
These honours were conferred by Ascham as inducements to
his continued and increasing application; and such was his
improvement, particularly in the Greek language, that
his lectures, both in the university and in his own college,
were received with universal applause. In the year 1536,
and at the age of twenty-one years, he was inaugurated
master of arts. Such was the proficiency of those who at-
tended his lectures, that one of them, viz. William Grindal,
was, at his recommendation, appointed to be tutor in the
languages to the lady Elizabeth; an honour which it is prob-
able he might have obtained for himself, if he had not de-
clined it from a preference of the academical life to a station
at court. At this time Sir John Cheke attempted to in-
trude a new mode of pronouncing Greek into the univer-
sity, which for some time was opposed by Ascham; but
upon maturing and more deliberate examination, he approved
of it, and concurred in adopting and promoting it; and it
has since generally prevailed in the schools of England.
The purity and elegance of his Latin style were held in such
estimation, that he was constantly employed in writing the
public letters of the university. As a relaxation amidst his
 heavier studies, he amused himself with the exercise of arch-
ery; and having thus given offence to some persons who
were envious of his superior merit, he wrote a small tracts
on the subject, intitled "Toxophila," which was published
in 1544. His design in writing this tract was partly to
vindicate himself from the aspersions of his enemies, and
partly to improve the English language, by introducing a
more natural, easy, and truly English diction, than that
which was used by the common writers of his age. The
author's views in both these respects were fully acco-
 mplished. This work, besides the purity and perspicuity of
its style, abounds with learned allusions, with curious frag-
ments of English history, and with ingenious observations
on life and manners. Ascham honestly confesses, that he
was actuated by another more felicitous motive in the com-
position and publication of this tract: He wished to make
a tour into Italy, which was then the republic of letters, and
particularly the seat of Greek learning; and he was dis-
fious by dedicating his work to king Henry VIII. to ob-
tain his patronage and encouragement in the prosecution of
his plan. In this respect, his modesty and laudable with
 was gratified: for in 1544, the king granted him a pension
of 10l. a year, equal according to Dr. Johnson, to more than
100l. at the present day. This pension, which was discon-
tinued after the king's death, was restored by Edward VI.,
and doubled by Queen Mary. In the same year, Ascham
received the pecuniary benefit as well as honour of an ap-
pointment to the office of Orator to the university; which
office, whilst he continued there, he occupied with great
erit.

He had also for some years received an annual gratuity
to an amount that is not ascertained, from Lee, archbishop
of York. At length, viz. in 1548, upon the death of his
pupil Grindal, he was called by the lady Elizabeth, to
whom he had already given lectures in writing, from his
college, to direct her studies. This charge he executed with
equal diligence and success; but after two years, a caufe of
disturbances occurred, and he returned from the service of
the princess to the university. Notwithstanding this cir-
cumstance, the princess's regard for him continued; for in the
same year, 1550, he was recalled to court, and appointed sec-
tary to Sir Richard Morpion, who was then going as amba-
bassador to the empe or Charles V. During this expedition,
which lasted three years, he had opportunity of conversing
with many learned men in various parts of Germany which
he visited, and made an excursion into Italy, where he was
much diverti with the manners of the inhabitants, par-
ticularly of the Venetians. One of the fruits of this tour
was a curious tract, intitled, "A Report and Discourse of
the
of the Affairs and State of Germany," &c. which contains valuable information and judicious reflections.

On the death of Edward VI. in 1553, Morley was recalled, and Afchan returned to his college, with no other support than his fellowship and salary as orator to the university, and the liberality of his friends. But by the intercession of Bishop Grafton, who, though he knew him to be a protestant, did not defect him, he was appointed Latin secretary to queen Mary, with a salary of ten pounds a year, and permission to retain his college prebend. Afchan by his prudence, without any servile compliances that reproached his integrity, enjoyed the favour of the queen, and in the most perilous times, he maintained his interest with Elizabeth; and he was partly indebted to the fidelity of his friendship with Cecil for his prosperity in the next reign. Indeed, his learning, and the facility with which he wrote Latin, made him necessary at court. In his capacity as Latin secretary, he is said to have written in three days forty-seven letters to persons of such rank that the lowest of them was a cardinal. Upon the accession of Elizabeth, Afchan was continued in his former employments with the same stipend. He had daily access to the queen, and read with her some portions of works in the learned languages for some hours every day, and of her proficiency under such a master many proofs remain. Notwithstanding the benefit which the queen derived from his services, and the intimacy with which she honoured him by permitting him to play with her at draughts and chefs, he obtained from her no other recompense than a pension of twenty pounds a year, and the prebend of West wa ng in the church of York. This poor pittance has been ascribed by some to the parsimony of the queen, and by others to her knowledge of the extravagance of Afchan. He has been charged, and not unjustly, with a profligacy, disgraceful to a man of letters and humanity, to cock-dighting. In his "Schoolmaster," he intimates a design of writing a book "Of the Cockpit," which he reckons among the pastimes fit for a gentleman. It is a subject, however, of regret, that whilst the queen did not think him unworthy of her patronage, she did not think proper to remunerate him for his services with a liberality more suitable to her high station. In the year 1563, a conversation occurred at Sir William Cecil's on the subject of education. Whilst the subject was much agitated, and different opinions were entertained, Sir Richard Sackville was so much prepossessed in favour of Afchan, by the arguments which he used for the mild treatment of boys, that he solicited his counsel and assistance with regard to the education of his son, and at the same time requested that he would write a treatise on the general subject of education. Thus was produced Afchan's excellent performance, intitled, "The Schoolmaster," a work replete with erudition, and fugitive useful advice on the best method of teaching the chil dren. Afchan particularly recommends the method of "double translation," which merits adoption in schools. This treatise was published after the author's death by his widow, in 1571, and reprinted with notes, in 1580, at London by Upton, in 1571. Afchan's last illness was occasioned by too sedulous application to the composition of a poem, which he intended to present to the queen on the New Year's day of 1569. He died in his 53d year, December 23d, 1568. His death was generally lamented, and the queen expressed her concern by exclaiming, that "she would rather have lost 10,000l. than her tutor Afchan." His epistles, which have been much commended for the elegance of their style, and also for the abundance of historical matter which they contain, were published in 1577, by Grant, and dedicated to queen Elizabeth; and his miscellaneous pieces have been since collected by Bennett into one volume, with a life by Dr. Johnfon prefixed, and published in 1571, in 4to. Afchan is said to have been an elegant poet; but his works are not to be found in the best edition of his works. One of his biographers, speaking of his works, says, "He Topophillus was a good book for young men, his Schoolmaster for old men, and his Epistles for all men." Mr. Wood afribes another work to our author, intitled, "Apologia contra Missam," printed in 1577, 8vo.

It appears from the writings of Afchan, and those records of him that remain, that his temper was amiable; that he was kind to his friends, and grateful to his benefactors; that he was inclined to free inquiry on the subject of religion, but too much engaged in other pursuits to be able to give much attention to this object; that he was, as a man, respectable; and that, as a scholar, he procured correct taste and found learning; and by thus serving both his contemporaries and posterity, he deserved much more ample recompense than he received. He died poor, and left a widow and several orphans in delitute circumstances. His poverty has been ascribed by some to his attachment to dice and cock-dighting; and it is noticed by Buchanan in the following short epigram, said by some to display more wit than friendship, which he confided to his memory:

"Afchanum extinctum patriae Grajisque Camana
Et Latins verum pietate, dolent;
Principibus vitæ carus, jucundus amicus,
Re modicè, in mores diece fama acquisite."

Thus translated and paraphrased:

"The Attic and the Latin muse deplore
The fate of Afchan, once their joy and pride;
His laws shall charm the listening crowd no more;
Ereteen'd by kings, lov'd by his friends, he died.
Fortune denied her treasures—juffer fame
Honour'd his worth, and spread abroad his name."

ASCARIANS, or ASCHARIANS, followers of Af chan, or Ahari, one of the most celebrated doctors among the Mahometans, who died at Bagdat, about the year of the Hegira 329, or of Chrifl 940, and who was secretly buried, left the Hanbalites, by whom his opinions were reckoned impious, should tear up his remains from the grave. The Ascarians were a branch of the Sefatiuns; and their opinions were, 1. That they allowed the attributes of God to be distinct from his essence, yet so as to forbid any comparison to be made between God and his creatures. 2. As to predilection, they held that God hath one eternal will, which is applied to whatsoever he willeth, both of his own actions and those of men, so far as they are created by him, but not as they are acquired or gained by them; that he willeth both their good and evil, their profit and their hurt; and as he willeth and knoweth, he willeth concerning them that which he knoweth. They went so far as to say, that it may be agreeable to the will of God that man should be commanded what he is unable to perform. But while they allow man some power, they refrain it to such a power that cannot produce anything new. God, they say, orders his providence so, that he creates after or under, and together with, every created or new power, an action which is ready whenever a man wills it and acts about it; and this action is called "casib," or acquisition, being, in respect to its creation, from God, but in respect to its being produced, employed, acquired, from man. This is generally esteemed the orthodox opinion, and has been variously explained.

3. As to mortal sin, the Ascarians
Afgharitans taught, that if a believer, guilty of such a sin, die without repentance, his sentence is to be left to God, whether he pardon him out of his mercy, or whether the prophet intercede for him, or whether he punish him in proportion to his dement, and afterwards, through his mercy, admit him into paradise; but that it is not to be supposed he will remain for ever in hell with the infidels, since it is declared, that whoever shall have faith in his heart, but of the weight of an all, shall he delivered from hell-fire. This is generally received as the orthodox doctrine in this point, and is diametrically opposite to that of the Moslem. D’Herbelot’s Bibl. Orient. Selle’s Koran. Pet. Difc. p. 165.

ASCHAUSEN, in Geography, a town of Germany, in the circle of Saubia, eight miles north of Ravensburg.

ASCHBARAT, a town of Turquetian, in the country of the Gates, on the other side of the river Sihon.

ASCHBOURKAN, or ASCH-FOURKAN, a town of Persia, in the province of Chorasan.

ASCHEION, in Ancient Geography, a town of the Pelo-ponnesus, in Achaia.

ASCHENGISKOL, in Geography, a fortress of Sicilia, on the confines of China, 130 miles S.S.W. of Selinguhk.

ASCHER, a district of the sif of Aggers-Herred, in the diocese of Christiania, or Agerhuus, in Norway.

ASCHERSLEBEN, a town of Germany, in the circle of Lower Saxony, and principality of Harlbracht, seated on the-Eine. It was once the capital of a country to which it gave name, and was one of the most ancient provinces of the house of Anhalt. The circle of Ascherleben, or Aachen, comprehends the tract which was once the Ascherleben, or Gaterleben lake, about two German miles long and half a mile broad; but being drained between the years 1703 and 1709, is now become good corn and pasture land.

ASCHIA, ASCHER Cramer, ASCHE Genser, &c., in Ichthyology, synonymous names of the sif called Grayling in England; and by Linnaeus SALMO THYMALLUS; which fee.

ASCHOUR, in Geography, a river that passes by the town of Kafch in Turquetian, towards the north.

ASCHRAFF, in Ancient Geography, a city of Persia, in the province of Mazendran, near the Caspian sea, was once the favourite residence of Abbas the great, but now fallen into decay; the splendid palaces and gardens being sunk into a ruinous flat, since the commotions that followed the death of Nadir Shah.

ASCHTIKAN, in Geography, a town of Afia, in Independent Tartary, fifteen leagues from Samarcand.

ASCHWOMSEN, a lake of Prufia, forty miles south of Konigberg.

ASCIA, in Antiquity, an instrument, suppofed to be of theaxe kind, used in the fabric of the Roman tombs, and frequently represented on them.

The formula "sub alica dedicatur," is frequently found inscribed on ancient tomb-stones. We also meet with "rogum alica re polito," among the antique laws of the Twelve Tables. These expressions, and the figure of the alica, as seen on the tombs, have puzzled several antiquaries, who have formed very curious conjectures concerning it. F. Martin rejects all their opinions, and with considerable probability affirms, that the alica was a hoe, or fort of pick-axe, for digging up the ground, which is to this day called chibado, or affaid in, in Languedoc. This alica, he pretends, was not an instrument of common use, but consecrated and employed only for digging of graves; and that it is the same with what Sidonius Apollinarius calls rafium functire, where-with the Gauls digged their graves. Lib. iii. ep. 13.

This, he thinks, appears plainly to be the signification of the word, from the Latin proverb, "ipsi sibi alicaem in cruse impiegat," which often happens to those who work with this instrument.

On this footing the famous law of the Twelve Tables, wherein the alica is mentioned, and the explication of which has puzzled all our antiquaries, contained only a prohibition to dig graves with an instrument of iron or copper, such as the alica. In reality it was a tradition observed by the remotest antiquity, that no instrument made of those metals should be used in sepulchres.

Dom. Martin has given a dissertation concerning the funeral monuments of the Romans, consecrated "sub alica." La Relig. des Gaul. tom. ii. liv. 5.

Mabillon, in his explication of the formula "sub alica dedicatur," &c., conjectures that the ancient, in dedicating their tombs to the names, made imprecautions against those who violated their sanctity; and these imprecautions, he conceives, were expressed by the figure of the alica, which bore a threatening aspect. Much to the same purport is the opinion of Muratori, who apprehends that the formula "sub alica," or the alica itself placed upon the tombs, was a tacit but well-known supplication addressed by the perfons interred to the owner of the field in which the grave was dug, that the adjacent soil might be hoed, the briers removed, and the earth rendered light over the ashes of the deceased. Accordingly, "fit tibi terra levis," is part of an epitaph found on ancient monuments. The sentiments of Mabillon and Muratori have been illustrated and confirmed by count Caylus. Moreover it appears, that the Romans annexed no superstitious idea to the formula "sub alica dedicatur," as the first Christians made use of it on their monuments.

ASCIA is also used, in Surgery, for a kind of bandage, some oblique or crooked; whose form and use are well described by Seulcitus, in his Arman. Chirurg. p. 1. tab. 54. fig. 3.

ASCIBURGIIUM, in Ancient Geography, a citadel on the Rhine, mentioned by Tacitus, in which were a Roman camp and garrison; situated in a place corresponding with a small hamlet, now called Abaroi, not far from Meurs, in the duchy of Cleves.

ASCIDIA, in Natural History, the name of a genus of VERMES that belong to the Molufa tribe, the body of which is fixed, roundish, and apparently inflating from a heath; the apertures two, generally placed near the summit, one below the other, Gmelin. &c. These creatures are more or less gelatinous, and have the power of contracting and dilating themselves at pleasure; some are furnished with a long stem, but most of them are flexible. Gmelin enumerates the following species: papiliofa, gelatinofa, interdinali, quadridentata, rufica, echinata, mentula, venosa, praunum, conchilega, parallelogramma, virginea, canina, patula, aphabetra, scabra, orbicularis, corrugata, lepadiformis, complana, tuberculium, villosa, clavata, pedunculata, mammillaris, globularis, phueca, gelatina, cryallitha, ochodentata, patelliformis, pyura, aurantium, globularis: which see respectively.

ASCII, formed of the primitive a, and *a, in Geography, are those inhabitants of the globe, who at certain times of the year have no shadow: such are the inhabitants of the torrid zone, because the sun is twice a year vertical to them, and have then no shadow. — To bind on what days the people of any parallel are aet, see Globe.

ASCINODE, in Botany, a name given by the people of Guinea to a shrub, which they use in medicine, boiling it in water,
water, and giving the decoction in gonorrhoeas, and the like complaints. Petiver has named it the prickly Guinea shrub, with roundish crenated leaves, and filamentosous flowers. The leaves are about an inch wide, and about an inch and a half long; they stand on short foot-stalks; and at the ends of the branches, there stand clusters of flaminoous flowers. The thorns on the large branches are very strong. Phil. Trans. No. 232.

ASCITAI, in Ichthyology, a species of Silurus, that differs in several respects from other creatures of the same tribe, and is specifically described as having the dorsal fin fleshy, and eighteen rays in the anal fin. This fish inhabits the Indian seas, and is figured both by Bloch, and in Deter- vik's edition of Bufon. The mode of generation, or manner in which the young are produced, is singular, for it is neither oviparous, nor viviparous, but, partaking of both, forms a distinctly connecting link between those two natural divisions of fishes: the eggs are not comjposed like those of most other creatures, but confit merely of a yolk, without white, and surrounded by a thin skin to which the embryo is attached by means of an umbilical vessel on the outside, and by which it receives its proper nourishment till it is disengaged. Among other reasons it is affected that it cannot be viviparous, because it does not receive its nourishment from the parent by means of a placenta, but from this yolk of the egg, to which it is affixed while it remains in the matrix; and that it cannot be oviparous, because the eggs are not as usual deposited when completely formed, nor are the young contained within the egg, but only attached to the outside of it.

ASCITAE, derived from σακός, a bag, or bottle, in Antiquity, a fact or branch of Montanilla, which appeared in the second century.

The Alcites were so called, because they introduced a kind of Bacchanals into their assemblies, who danced round a bag or skin blown up; saying these were those new bottles filled with new wine, whereas Jesus Christ makes mention, Math. x. 17.—They are sometimes also called Affodrigios.

ASCITE, in Ancient Geography, a people of Asia, placed by Pliny and Ptolemy in Arabia Felix.

ASCITES, in Medicine, (from σακός, a bag, or bladder,) denotes a species of Dropsy which is situated in the abdomen. This disease is commonly divided into two kinds; viz. 1. When the water is contained within the peritoneum investing the general cavity of the lower body; and 2. When the fluid is included within a bag, or cyst, in which case it is called an incysted dropsy: but the description of this disease, and its appropriate treatment, will be found under the articles Dropsy, and Paracentesis or Tapping.

ASCITES, the operation for, in Surgery, is named Tapping, which see. This operation is likewise technically called Paracentesis. It consists in drawing off from the abdomen, by means of a trocar, the water or other fluid which is contained therein.

Species, 1. Ascium noravantae, Aublet Guian. t. 220. This is a tree furnished with alternate entire thick leaves. The flowers grow in hoofe spikes from the ends of the branches; they are alternate, subelliptic, and to each is a long bract, with a claw to it, resembling the cowled bag, of maneagravie, to which genus this seems nearly allied. It is a native of Guiana.

ASCLEPTA, in Antiquity, feaks celebrated in various parts of Greece in honor of Asclepius. They chiefly consisted of music, and a convent between musicians and poets. They were also called Macedonias, or the great festivals of Asclepius.

ASCLEPIAD, Asclepiades, a Greek or Latin version of four feet, containing a spondee, a choriambus, and two dactyls; or, which amounts to the same, a spondee, two choriambuses, and pyrrhichus.

Such are the verses,

"Meceas, stavis edita regibus."

"Subhmi feriam fidera vertice."

ASCLEPIADA, in Entomology, a species of Chrysomela, discovered by Pallus in the vicinity of the rivers Volga and Irin, in Siberia. It is of a dusky blue, and glossy; antennae black; dots on the thorax scattered; on the wing-cules disposed in lines. Pallus, Gmelin, &c.

ASCLEPIADES, Artorus, in Biography, physician and friend to Caesar Octavius, by whose advice the emperor left his camp the evening before the battle at Philippus, by which his life was probably preserved, that part of the army being surprized and cut to pieces by Brutus. Artorius perished by ship-wreck soon after the battle at Actium, and the emperor caused a magnificent monument to be erected to his memory at Smyrna. He is said to have maintained, that the flonarch is the part principally affected in the hydrophobia. Haller Bib. Med. Prac.

ASCLEPIADES, descendants of Asclepius, to call, who were supposed to have preserved the fetures of their progenitor, and to have founded schools of medicine in various parts of Greece, which continued many ages. The most famous were those of Rhodes, Cnidos, and Cos, formed by different branches of the family. Hippocrates was derived from the latter branch; see article Hippocrates.

ASCLEPIAD, a celebrated physician, born at Prusa in Bithynia, flourished somewhat before the time of Galen, and formed an intimacy with L fcius Cr atius the orator, and other persons of distinguished character. It is not known whence he took his name, as he was not of the family of Asclepius. After completing his education, he went to Rome, where he commenced by teaching rhetoric; but not succeeding in that line, he applied himself to the study of medicine, in which he soon became famous: for, rejecting the doctrines of his predecessors in that art, he formed a new theory of diseases, and instituted new methods of curing them. He avoided all harsh and violent drugs, particularly vomiting and purging medicines, which, he contended, injured the stomach, and induced complaints more dangerous than those they were given to remedy, and professed to cure diseases, "tutis, et efficaces." Rome con vexit (Haller says) at lassum et mollitionem Romanum acerbo accommodavit. He was attached to the corporeal philosophy, and thought that the first motion of the corpuscles in the vessels constituted health, and that diseased when they were restricted or checked in their motion by the obstructions of the vessels. "Thns pains, ardent fevers, intermittentis, &c. were occasioned (he said) by corpuscles impacted in the pores." A doctrine full as intelligible, "as the才or of the humour obstructing the vessels," the favourite theory of one of the most celebrated teachers.
teachers in the last century. In fevers, he prohibited all food, and even drink to his patients for three or more days, but when by this means, the violence of the fever was abated, he inducted them with warm coverings, and with wine. When convalescent, he used glycyrrhiza, which he frequently employed. In pleurisy, and in other complaints attended with violent pain, he prescribed bleeding, but in chronic complaints, he depended principally on abstinence, exercise, baths, and frictions. These, he said, opened the pores, and gave free exit to the obstructed particles.

That he was in high repute in his time, we have the authority of Celsus, Claudius Aurelianus, Galen, and Scribonius Largus, from whose writings what is known of his opinions and practice is principally taken, as none of his works have been preserved. Mithridates, king of Pontus, invited him to his court; but his employment at Rome was too lucrative to permit him to accept the offer.

But besides the reputation he acquired by his practice, his fame was further increased by the number of pupils or disciples who attended his school, and who continued to follow his method long after his decease. Themion, one of his disciples, in part adopting, and in part deviating from his master's doctrine, formed a new sect, under the title of the Methodists, which became general. Aeclepiades is said to have pledged his reputation on preferring his system, to have lived to a great age, and to have died at length in consequence of a fall. Le Clerc Histoire de la Medicine. Haller Bib. Med. Pract. who gives a detailed and particular account of his practice in a variety of diseases.

Aeclepiades, a Greek philosopher of the Eleac school, was born at Phila, in Peloponnesus, and flourished about 350 years before Christ. He was the intimate friend and associate of Menedemus, whilst they both attended the school of Stilpo, and afterwards when they attended Phedo's school at Elis. They were under a necessity of supporting themselves by the manual labour of masons. They left their country for the sake of enjoying the advantages of Plato's school at Athens, and gained a subsistence by grinding in the night in one of the public prisons, that they might be able to spend the day in the academy. When the Athenian magistrates, upon inquiring into their mode of subsistence, were informed of this circumstance, which manifested their want of knowledge, they applauded their zeal, and prevented the apprehensions entertained by them. Aeclepiades lost his sight, but bore the affliction with equanimity.

Aeclepias, in Botany, swallow-wort. (From Εφεσεώς, the god of medicine.) Linn. gen. 306. Schreb. 429. Jaff. 147. Geer. l. 117. Clas, pantodentia digynia. Nat. Order. Contortae. Apocineae. Jaff. Gen. Char. Cal. petiolatia, cleft, sharp, very small, permanent. Cor. mono-petalus, flat, or reflex, five-parted; divisions ovate-acuminate, slightly bending with the fun; nectaries five, growing to the tube of the filaments, fleshy, or cowed; a sharp horn protruding from the bottom, bending inwards. Stam. filaments five, collected into a tube, swelling at the base; anthers oblong, upright, two-celled, terminated by an inlexible membrane lying on the stigma, having a reversed wing on each side; the pollen is collected into ten corncibles, invariable lanceolate, flat, hanging down into the cells of the anther, by short threads, which are annexed to pairs of five cartilaginous twin tubercles, each placed on the tip of the flanks of the anthers, adhering to the angles of the stigma, between the anthers. Fil. germs two, oblong, acuminate; style two, fimbriate; stigma common to both, large, thick, five-cornered, covered at the top by the apexes of the anthers, umbilicate in the middle. Per. follicles two, large, oblong, acuminate, swelling, one-celled, one-seeded. Seeds numerous, imbricate, crowned with down; receptacle membranaceous, five.

1. A. undulata, waved-leaved swallow-wort, apocynum africamum, lapathi folio, Comm. Rar. t. 16. "Leaves feffile, oblong, lanceolate, waved, smooth." A native of the Cape of Good Hope. It was introduced into our gardens in 1753. Its flowers are seen in July. 2. A. trigyna, curled-leaved swallow-wort; apoc. erectum afric., &c. Herms. par. 25. Comm. Rar. t. 17. "Leaves cordate, lanceolate, waved, febrile, opposite; umbel terminal." Its stem is pubescent, branching at the bottom; leaves sub-fidibus, repand; one umbel of yellow flowers terminates the stem. Found at the Cape by Sparrman. Introduced into the Kew garden by Mr. Mollon, in 1774.

3. A. pubescens, pubescent swallow-wort; apoc. afr. tuberosum, &c. Morr. Hist. 5. 610. Plack. 139. f. 1. "Leaves ovate, veined, naked; item fruhvy; pedicelles villous." The item is shrubby, simple or little branched, very shortly villose; leaves on very short footstalks, villose, pointed, much veined, rather crowded; pedicels and umbels villose; flowers purple. A native of the Cape of Good Hope. 4. A. volubilis, twining swallow-wort; Rheed. Mal. 9. 24. t. 13. Rumphi. Amb. 5. t. 175. f. 1. "Leaves ovate, entire, acuminate; item adnecose, twining; umbels erect; item smooth; branches shaving; leaves pilos, ovate-subcordate, veined; umbels simple, on peduncles the length of the petiole; flowers greenish. A native of Malabar and Ceylon. 5. A. aethiopica, aethiopic swallow-wort. "Leaves petiolate, cordate-ovate, above smooth, entire; item fruhvy, twining, hisrufe; umbels few-flowered." The whole plant is villose, except the upper surface of the leaves, which resemble those of laurel, heart-shaped at the base, pointed at the apex; umbels shorter than the leaves, often proliferous; flowers small. Found in the woods of Ceylon by König. The root is esteemed in aethiopic cafes. 6. A. gigantea, curved-flowered gigantic swallow-wort, Brown, Jan. 182. 1. "Leaves ovate-oblong; petioles very short; segments of the corolla reflex, involute. It rifes fix or seven feet in height; leaves thick; flowers white; pods very large; nectaries without horns. Brown says, in Jamaica it is called curcularia, or French jacinth. Cultivated at the royal garden, Hampton court, in 1690. It flowers from July to September. 7. A. fruticos, Syrian swallow-wort. Hort. Cliff. 78. & A. caudata. Lin. Spec. 313. "Leaves oval, tomentose underneath; item simple; umbels nodding;" root creeping; item strong, four feet high, on the sides of which, and near the top, the flowers appear, these are of a dingy purple, succeeded by large oval pods. A native of North America, and cultivated by Parkinson in 1629. In Canada, the French cut the tender shoots as asparagus. Poor people collect the coton, from the pods, with which they fill their beds. On account of the likeness of this cotton, Parkinson calls the plant Virginian flax. 8. A. amara, oval-leaved swallow-wort; apocynum, Dill. Eth. 21. t. 27. f. 30. "Leaves ovate, rather hairy underneath; item simple; umbels and nectaries ered." From a foot and half to more than three feet high; items round, smooth, the size of a strand's quill. At each joint are placed two large leaves, which are blunt, thickish, fimbry, smooth, with purple nerves; lower leaves smaller and rounder; the umbels arise from the top of the stalk, and some of the upper axils; the nectaries approximate more,
are slighter, longer, rifer, more acute, and less excava
ted than in the other species; the flowers are of a bright
purple colour. Cultivated by Dr. Sherard, at Eltham, in
1732. A native of North America. 9. A. purpurascens, purple
Virginian swallow-wort, Dill. Elth. 32. t. 29. f. 21.
"Leaves ovate, villose underneath; stems simple; umbels fructifer;
nectaries reflexuate;" stems many, as thick as the little
finger, at bottom obtusely quadrangular; leaves on short
footstalks, from four to six inches long, with a purple
midrib; flowers of a dull herbaceous colour; horns of the
nectaries horizontal. A native of North America. Cul-
tivated by Dr. Sherard, in 1772. Linnæus observes that
this species is nearly related to A. Syrica. 10. A. variegata, variegated swallow-wort, apoc. americanum. Dill.
Elth. 32. Pluk. Alm. 34. t. 77. f. 1. "Leaves ovate,
wrinkled, naked; stems simple; umbels subflabellate; pedicels
tomentose." According to Miller, this resembles the for-
going sort, but the leaves are rough, and the umbels of the
flowers are more compact; they come out on the side of the
flanks, are of a herbaceous colour, and not succeeded by
pods in this country. A native of North America. We
learn from Plukent, that it was cultivated here in 1695.
11. A. curassavica, Curassavian swallow-wort, bialert ippecacuan-
ha, Brown, Jam. 183. 4. Apocynum. Dill. Elth. 34.
t. 30. f. 33. Sibam. t. 1. 129. f. 4. 5. "Leaves lanceolate,
smooth, shining; stems simple; umbels erect, solitary, lax-
yak. The stem is from one to two or three feet in height;
leaves ovate, and decollated, petioled, acute, entire, smooth
on both sides; flowers in umbels; umbrellas terminal; in-
volve a few fiddle-shaped leaflets; pedicels one-flowered; corolla
reflex; the flowers, according to Brown, are of a fawn
colour in the low lands, but in the cooler inland plateaux
they change to a white. This species so much resem-
bles A. nica, that Swartz doubts whether it be really dif-
tinct from it. Miller affirms that the roots have been sent
to England for ippecacuana. The juice of the plant has
been used as a vermifuge. It is a native of South America,
the West Indian islands, and China. In 1692, it was cul-
tivated in the royal garden at Hampton-court, where it flowed
from June till September. 12. A. nica, white or almond
leaved swallow-wort. Apocynum, Dill. Elth. 35.t.29.
f. 32. Plum. Spc. 2. 1c. 39. "Leaves ovate-lanceolate,
smooth, shining; stems simple; umbels erect, solitary,
flowers two feet high, flat, round, the fize of a fawn's
quill, dark green; leaves like those of common pericaria,
deep green above, pale beneath, smooth, rather fluff.
The principal difference between this and the curassavica is in
the flowers, which are green with white nectaries. A native
of North America. Cultivated by Dr. Sherard in 1732. 13.
A. incarnata, flesh-coloured swallow-wort, Jacq. hort. 2.
t. 107. "Leaves lanceolate; stems divided at the top; um-
bel s erect, tawny." This puts several upright flanks,
about two feet high; at the top of which are produced close
umbels of purple flowers in Auguill. A native of North America.
Cultivated by Miller in 1731. 14. A. decumbens, decumbent swallow-wort. "Leaves villose; stems decum-
bent." The flanks are declivous, hairy, a foot and a half
high; leaves narrow; umbels compact, at the extremity of
the branches; flowers of a bright orange colour. A native
of North America. 15. A. laetiflora, milky swallow-wort;
"leaves ovate; stems erect; umbels proliferous very short."
This is so like the vincetoxicum as scarcely to be distin-
guished from it; the leaves however are less coriaceous,
the corymb compound, and scarcely longer than the pedicels.
A native of Ceylon. 16. A. vincetoxicum, officinal swallow-
lutea. Mill. Dicbt. "Leaves ovate, bearded at the base;
flabellate, umbels prolific;" root divided and fibrous;
flowers about two feet high, slender, woody, round, hairy,
flame; leaves cordate-ovate, acuminate, smooth, entire, on
short footstalks; peduncles axillary, many-flowered; corolla
white; follicles ovate-acuminate; seeds small, brown,
inclosed in cotton. It flowers during the month of June,
July, and Auguill. It is common in the northern parts of
the continent. The medical virtues of the root are stated by
Bergius to be diuretic, fodiocide, emmenagogue, and alex-
iphatic. 17. A. nigra, black swallow-wort, Villars' Dagh.
487. "Leaves ovate, bearded at the base; stems twining
a little at the top." This agrees with the officinal species in
the shape of its roots, leaves, and flowers, but the flanks ex-
tend to a greater length, and at the upper part twitc round
other plants, &c. near them; the flowers are black. A
native of the south of France.

** Leaves volut. at the nodes.

18. A. arboroscentes, arborecent frag-wort, apoc. fruticos.
&c. Bern. Afr. 21. t. 13. "Leaves ovate; stems subhy-
by, reflexuate;" stems upright, as thick as the finger, rough,
with hairs; leaves opposite, on very short petioles, obtuse,
but with a minute smooth point; pedicels from the sum-
mit of the stem, unbell'd, villose; corolla white. A
native of the Cape of Good Hope. Cultivated by the duch-
ess of Portland in 1714. It flowers in December. 19. A.
fruticos, subhybry, or willow-leaved swallow-wort. A. glabra,
Mill. Dicbt. t. 2. apoc. erectum africannum, &c. Mill. fct. 45.
β A. craffiolao, Lin. Syfl. ed. 13. "Leaves bipartite-
acolate, stems subhyby;" the nectaries are compressed,
without a claw, instead of which are two long reflex ears;
follicles inflated, set with soft prickles. This is a native of
the fane place, and was cultivated in the same year, and by
the fame peron, as the A. arboroscentes. 20. A. refanada,
reapped swallow-wort, apoc, erectum afric. subhybrium., &c.
Herm. Par. 45. Comp. Rar. t. 17. "Leaves revolute, re-
panied, hairy;" this is given on the authority of Reichard.
Its native country is unknown. 21. A. fibrica, Siberian
77. t. 21. "Leaves linear-lanceolate, opposite, or in three
fem decidum." This varies with alternate leaves. It is
a native of Silberia, and cultivated in 1775, by Mr. J. G.
Brown. It flowers in July. 22. A. verticillata, verticillate
swallow-wort, apoc. marianum, &c. Mill. Pl. 17. t.
336. f. 4. "Leaves linear verticillate, stems erect;" the flanks
flender, upright; flowers small, white, in umbels at the top
of the fem; leaves frequently four together. A native of

*** Leaves alternate.

23. A. rufa, red swallow-wort. "Leaves ovate, umbels
many, from the same common peduncle." Stem upright,
spurce, annual; leaves acuminate; several umbels on a
peduncle. A native of Virginia. 24. A. tuberosa, tuberosous
t. 647. Dill. Elth. 35. t. 50. f. 34. "Leaves lanceolate;
stem divaricate, hairy." Stems a foot high, hairy, round,
duky red; leaves alternate, except at the upper part of
the stem, and where the branches arise; flowers of a bright
orange colour; the tuberous roots are very large. A
native of North America, flowering in Auguill. Cultivated
in 1690, in the royal garden at Hampton-court.

**** 25. A. foemina, narrow-leaved swallow-wort.
"Leaves filiform; stems erect; umbels lateral, elongate,
peduncled." This species was found at the Cape of Good
Hope, by Thumberg. 26. A. grandifloro, great flowering
swallow-wort. "Leaves petioled, oblong, hairy; stems
spurce, rough, erect; flowers axillary, peduncled." The flower
of this is very large, coloured, and tsefticked like that of the
fritillary
frillaries. It also was found at the Cape by Thurber. 27. A. coronata, flitchy-leaved swallow-wort. "Leaves ovate, flitchy, very smooth;" leaves about four inches long, with out veins; petals flitchy, half the length of the leaves; umbel simple, axillary, solitary; calyx minute; corolla scarcely half an inch flat. This differs much from the other species. A native of Carolina. 28. A. fanderson, climbing swallow-wort, Mill. Dict. n. 19. "Leaves oblong, lanceolate, fiddle-shaped, hair-rough, climbing s umbels laterally, compact." It climbs to the height of ten or twelve feet. At the joints are two opposite leaves, on short foot-stalks. Flowers of a sulphur colour, and appear in August. A native of Carthage. Cultivated by Miller in 1759. 29. A. prostrata, bell-flowered gigantic swallow-wort, Ast. Hort. Kew. A. gigantea, Jacq. Ofib. 3. 17. t. 69. "Leaves oblate-oblong, petals very short; corollas subcampanulate." A native of Peru. Cultivated in 1744 by the duchess of Beaufort. It flowers from July till September. This ought to be placed before A. gigantea at 6. 30. A. farinosa, small-flowered swallow-wort, Ast. Hort. Kew. i. 307. A native of Carolina and East Florida. Introduced by Dr. Fothergill in 1774. 31. A. tenera, tall flax-leaved swallow-wort, Cavan. Hifp. 42. t. 57. "Leaves scattered, fiddle-shaped; umbels lateral, many-flowered, 6 or 7." A foot high; leaves narrower at the base, narrow, round, entire, axillary. We are ignorant of its native country. It has been cultivated in the royal garden at Madrid since 1788, and flowers in autumn. 32. A. mexicana, Mexican swallow-wort, Cavan. Hifp. 42. t. 58. "Leaves fix together in whorls lanceolate; flowers umbelbed." Stems upright, fiddle, a foot and a half high; leaves quite entire, with a short petiole; corolla white, deeply five-parted. A native of Mexico, and cultivated at the royal garden at Madrid. 33. A. fujara, Lour. Cochinich. 170. "Stem creeping; leaves cordate, lanceolate; umbels axillary, in pairs." Stem herbaceous, twining, fleshy, much branched at the top; leaves opposite, small, bearded at the base; flowers dull purple, small, with five car-shaped petals. A native of Cochin China. 34. A. viminalis, Swartz. Prodr. 53. Brown, ib. 1857. 3. Sloane, i. 207. t. 131. "Stem fleshy, twining, fiddle-shaped; leaves opposite, lanceolate, smooth; umbels lateral, many-flowered." Stalks fleshy, weak, spreading to the ground, and to one yard. It has very few leaves, but many flowers disposed in large umbellate groups; it abounds with a milky juice. A native of Jamaica in woods.

Propagation and Culture. In this numerous genus, only two species, viz. 16. and 17. are European; two or three are from South America; the rest are natives of North America, the East and West Indies, or Africa. Such as are inhabitants of North America, 7-10, 12, 13, 14, 22-24. are, as well as the European, hardy enough to bear the open air, and therefore proper for large borders in pleasant grounds, and to mix with shrubs. The other species require the protection of the green-house or flore; all of them are tall perennials, flowering from June till August or September, mostly dying down to the root in autumn. They should have little water, especially in winter; they may be propagated by seeds, where they can be obtained, or by cuttings; the hardy sorts may be increased by parting the roots. 14, 15, 24, 25, 26, 27, 28, 29, 30, 31, and 32, will live but in a flore. These must be raised from seeds sown in the spring on a hot-bed, and being transplanted into pots filled with rich earth, must be plunged into the sand-beds in the flore. After the second year, the 11th foot becomes naked, and does not produce many flowers, so that young plants ought to be raised to succeed them, especially as it produces plenty of seeds in England. All the Cape sorts, 1, 2, 3, &c. may be propagated by seeds sown in April on a bed of light earth in the open air, and when the plants are three or four inches high, they should be each planted in a small pot filled with light earth, and shaded till they have taken new root; then they may be placed with other exotic plants in a sheltered situation until October, when they may be removed into the green house or dry flore. They may also be increased by cuttings. The roots of the 5th and 22d should be planted in a warm border, and in winter covered with old tan. The 14th and 24th are propagated by seeds in pots placed in a moderate hot-bed, and gradually exposed to the open air as soon as the weather will permit. When they are of a proper strength they may be planted in a warm border, and treated as other tender plants. See Martyn’s Miller’s Dict.

ASCOLTER, in Geography, a town of Sweden, in South Gotland; twelve miles south of Wardberg.

ASCO, a town of Spain, in Catalonia, seated on the Ebro, ten leagues from Tortosa.

ASCODRUTAE, in Antiquity, a set in the second century, who rejected all use of symbols and sacraments; on this principle, that incorporeal things cannot be committed by things corporeal, nor divine mysteries by anything visible.

ASCODRUTUS, in Middle Age Writers, denotes a bridge supported on bags made of leather or bullock hides. Such bridges appear to have been in use among the ancient Greeks, and to have given the denomination to a tribe of Arabs, hence called Arabs.

Hence also the appellation of monami, given to pirates, by reason of their using bridges, or rather boats made of leather. Plin. Hift. Nat. lib. vi. c. 9. Du Cange.

ASCOLI, in Geography, a town of Italy, in the state of the church, and marquisate of Ancona, seated on a mountain between the rivers Tronto and Caffinian; twenty leagues south of Ancona, twelve north-east of Aquila, and thirty north-east of Rome. N. lat. 42° 50'. E. long. 13° 5'.

ASCOLESI, de Satricio, a town of Italy, in the kingdom of Naples, and province of Capitanata, the see of a bishop. This town was almost destroyed by an earthquake in 1399. N. lat. 41° 8'. E. long. 13° 32'.

ASCOLIA, in Antiquity, a feast which the peacants of Attica celebrated in honour of Bacchus. They sacrificed a he-goat to him (as being the destroy of vines); and of the victim’s skin made a foot-ball, which they blew up, and anointed with some unctuous matter; or, as Potter thinks, they made a bottle of it, which they filled with oil and wine. The young people playing at this, and keeping themselves always on one foot, whilst the other was suspended in the air, by their frequent falls gave occasion of derision to the spectators. He that held the sport longest, and made the largest hops, was the conqueror. Hence the game called cophafin. Picturus.

ASCOMARII, in Ancient Geography, a people of Asia, in Sarchatia. Pliny.

ASCONIA, in Geography, a town of Switzerland, lying on the Locarno Lake, in which is a college for the instruction of youth, founded in the sixteenth century.

ASCOUNIUS, in Ancient Geography, a town of Asia, the seat of Virgil, and the acquaintance of Quintilian and Livy. His notes on Cicero’s orations are judicious, and still exist, though in a mutilated state. They were first published, with those of Lucan, in folio, at Venice, in 1477;
ASCORNA, in Geography, a province of the empire of Morocco. See ESCURA.

ASCORUS, a river of Colchis, according to Arrian.—Also a town of Africa, in Mauritania.

ASCUS, in Natural History, a word used by De Laet, as the name of that pouch or bag with which nature has supplied the animals of the Diadephos or Opethum tribe, for the protection of their young; and in which they are contained in a state of imbecility, or time of danger. Later writers, as Linnaeus, Gmelin, and others, call this abdominal pouch, or receptacle, folliculus; it is not the womb, as is vulgarly imagined, but a kind of skinny bag, situated under the belly, and in most species containing the teats of the animal.

ASCYRUM, in Botany, a genus of plants resembling St. John's wort (supposed from s, and spiri, or spleen, aperaturus, not rough, a soft plant). Lin. g. 903. Schreb. 1225. Cascn. 62. Juss. 254. Clus. polygalphus polyandric. Nat. Ord. Rosaceae.—Hypericæ, Juss. Gen. Char. Cal. perennial, four-leaved: the outer leaves opposite, very minute; the inner heart-shaped, large, flat, erect, all permanent. Cor. petals four, ovate; the outer opposite, very large; the inner leaves. Sam. filaments numerous, bristle-shaped, slightly united at the base in four parts; anthers roundish. Pst. germ oblong; style scarcely any; stigma simple. Per. capsule oblong, acuminate, one-seeded, two-valved, inclosed by the larger leaves of the calyx. Seds. numerous, small, roundish, fixed to the edge of the valves.

Species. 1. A. crus Annuus, common acyrum, or St. Andrew's scrofts. "Leaves ovate; item round; panicle dichotomous." Stalks about six inches high, thinner, dividing into two towards the top; from between the divisions of the branches loose panicles of small yellow flowers are produced; capsule small, pointed at the ends, compressed as a lens, obliquely two-sawed. A native of North America. Cultivated by Miller, in 1759. It flowers in July and August. 2. A. hypericoides. Brown, Jam. 309. Swartz. Obs. 294. Hypericoides, Sc. Plun. Gen. 51. t. 152. f. 1. "Leaves oblong; branches erect," An elegant little shrub, three feet high, full of leaves and branches. Branches dichotomous: twigs compressed and aciculate; leaves opposite, subacute, lanceolate, obtuse, entire, very finely perforated, smooth, at their base small glands; flowers terminating, solitary, yellow; two leaves of the calyx four times larger than the others. A native of South Carolina, Virginia, Maryland, and the cooler mountains of Jamaica. Cultivated by Miller. 3. A. villifum. "Leaves hirsute; stem stiff and straight." This grows about three feet high. The flowers are produced at the ends of the stalks, and are of the same shape and colour as those of common St. John's wort. It grows wild in Virginia, and was cultivated by Miller in 1759.

Propagation and Culture. These are perennial plants, the stems decaying in the autumn. The first may be increased by laying down its branches; it loves a moist soil and shady situation. The second rarely produces seeds in England, but may be propagated by cuttings of the young shoots in May, planted in pots, and plunged in a moderate hot-bed, and afterwards transplanted into a warm border; but in severe winters they must be defended from the frosts by covering the roots with straw. The third may be increased by parting the roots in autumn, and planting them in a sandy soil. See Martyn's Miller's Dict.

ASCYRUM. See HYPERICUM.

ASDRUBAL, in Biography, a name given to several of the Carthaginian generals. Aedruba, the son-in-law of Hamilcar, the father of Hannibal, accompanied Hamilcar into Spain after the first Punic war; and on his death, was elected by the army his successor. Having made considerable conquests in Spain, he built a city called New Carthage, now Carthagena, in order to secure them. Hannibal served during three campaigns under him. His administration in Spain was prosperous for eight years; but it terminated with his affiancement, which was effected by a Gaul, whose master he had put to death. The affianced was so gratified with his revenge, that he filled in the midst of the tortures with
ASE

with which he was executed.—Afdrubal Barca was the son of Hamilcar and brother of Hannibal. He commanded in Spain, while his brother was in Italy. After extinguishing a rebellion of the natives, he was summoned to the assistance of his brother, but in his progress was completely defeated by the Romans. Afdrubal and the other Carthaginians generally maintained themselves with difficulty in Spain, and were frequently defeated by the two Scipios; but at length these two leaders were overpowered by the Carthaginians, and killed. Whist he was advancing along the coast of the Adriatic to join his brother, and the existence of the Roman fleet was threatened by his numerous army, he was met at the river Metaurus, now Metaro, by two confuls Livius and Claudius Nero with their united forces; and a bloody engagement ensued, which proved decisive, for Afdrubal was slain, and almost the whole of his army destroyed. Claudius Nero carried the head of Afdrubal to his brother Hannibal; and when it was thrown into the Carthaginian trenches, it was presented to Hannibal, who recognizing his brother’s features, exclaimed: “I perceive the fortune of Carthage,” and then retired, in the year before Christ 203, into the extremity of Italy.—Afdrubal, the son of Gisco, served in Spain with the former Afdrubal, and afterwards in Africa, against Scipio. He was father of the celebrated Sophonibus.—Another Afdrubal defended Carthage in its last siege by Scipio, and foreseeing its fate, surrendered himself to the Romans. When his wife, who was left behind him with her two children in the temple of Aeculapius, perceived that the temple was set on fire, she appeared on the walls magnificently adorned, with her two children; and having reproached and executed her husband for白白defeating her, she flit hatted her children, and then threw herself into the flames. See Carthag.

ASDYNIS, in Ancient Geography, an island of Egypt, in the lake Mosis, according to Eudoxus, cited by Steph. Byz.

ASE, in Biography, a celebrated Jewish rabbi, was born at Sora in Persia, and was chosen chief of the famous academy in that place, in the fourteenth year of his age, which dignity he retained during sixty years, that is, till the year 427, in which he died. Afe was the principal compiler of the Babylonish talmod. During his long residence at Sora, he published a collection of his decisions, which he divided into four parts: the first contained the rules and maxims of the Mifheva, with the doubts and solutions relating to them; the second was chiefly occupied with the various questions of their doctors, and the sentiments of the Talmud and Gemarilis; the third comprehended the decisions and maxims published since Judah the fain; and the last recapitulated the texts of scripture relating to law-suits, with the comments of their learned men. This was the first division of the Babylonish talmod; but as Afe did not live to complete it, his disciples altered his method, and made several additions, which are thought to have rendered the work more obscure. See Talmud.

ASEA, in Ancient Geography, a town of Arcadia, north-east of Megapolis.

ASELGRUR, in Geography, a town of Hindoosfan, in the Candela, fifteen miles from Burnhampour, and eighty-five south of Indore.

ASEIAC, a town of Persia, in the province of Chufian, thirty leagues south-west of Ifpanah.

ASEKI, or Aserai, the name which the Turks give to the favourite sultanees who have brought forth sons. They are greatly distinguished above others in their apartments, attendants, pensions, and honours. They have sometimes shared the government. The sultan, who first presents the emperor with a male child, is reckoned the chief favourite, is called bayut akbi, and ranks as a legitimate wife; though from the time of Bajazet II. the sultans are forbidden to marry by a public law, which Solymans II. violated in favour of Roxelana.

ASELE, Aafee-Lapmark, or Angermanland Lapmark, in Geography, a province of Lapland, lying near the Angermanland river, borders on Angermanland, towards the earl, on Umea-Lapmark towards the north, and joins to the mountains on the west, and to Jantland on the south. In length it is about thirty Swedish miles. In the reign of Charles XI. about the year 1673, measures were taken for improving the population of this country. In this Lapmark lies the parish of Afele, about eight or nine Swedish miles long, of which the southern part is inhabited by Swedish peasants. This district is not capable of much improvement, and few parts of it have been cultivated. Barley is the only grain that is grown, and when the crop fails, the inhabitants are reduced to the necessity of mixing the bark of fir-trees dried and pulverized with their barley-meal, and of this mixture to make their bread. They chiefly subsist by breeding of cattle and fishing. The country is infested by a kind of watery rats, which are very troublesome, against which they secure themselves by besmeering their faces with an ointment of tar and grease, and which they drive from the huts by smoke. A service is performed in a wooden church, built by queen Christina in 1648, once on every other Sunday; and the Lapps meet once a fortnight, on Friday evening, and continue till Sunday evening in their huts erected near the church, and the peasants in the huts built by them for the same purpose. At the fair which is held every year at Xene near Afele church, the Lapps sell the flesh and skins of rein-deer, furs, whittings, fowls, &c.; and the Lapland peasants carry butter, cheese, dried fish, fowls, and some dot of furs, to the fair market.

ASEL LINA, in Entomology, a species of Phalana that is found in Germany. The wings are brownish, and without spots. Fab. It belongs to the Bombyx family.

ASELLI, in Antiquity, two fixed stars of the fourth magnitude, in the constellation Cancer.

ASELLII Pancreas, in Anatomy. See Pancreas.

ASELLINA, in Natural History, a species of Lernna described by Linnæus. Lin. S. V. The body is bunted, and the thorax heart-shaped. Found on the gills of some fishes.

ASELLIUS, Gasp., of Cremona, in Biography, born toward the end of the sixteenth century, taught anatomy at Paris with great reputation. In 1622, while prosecuting his studies, he discovered: “causam quæs timet concilia,” Douglas says, the lacteals running across the mesentery, in a dog that had been opened alive soon after eating a plentiful meal. He describes these vessels as passing from the intestines to the liver, not knowing their real course, and mistaking the lymphatics of that viscus for them. He saw their valves, preventing the regurgitation of the chyle. The lacteals, he candidly observes, had been mentioned by some of the earliest medical writers, but not described, or their functions stated, and as none of the modern reformers of anatomy noticed them, the discovery is properly attributed to him. Caspar Hoffman ridiculed the invention of them; and our great countryman, Harvey, supposed them to be only defined to convey the lymph.

Acellus mixed a collection of glands in the mesentery for the pancreas, and described the pancreas as a new discoverd gland, which, with his error in describing the coupl
of the lizards, throw much obscurity on his discovery. He
died some time in the year 1624, and was buried at St. Peter's
at Milan, aged, as appears by the interment on his tomb,
only forty-five years. The year following, his friends, Alex-
ander Padim and Senator Septulius, published, from a man-
uscript that had been prepared by the author, "De Lacti-
busbus Lacteis Venis, quarto Vafumor Meteoricorum Genero,
noventoino, Dilisimnattc, cuo figuris elegendisins, Medici-
i, 1627, 400." It was republished at Bâle 1628, at Leyden
1628, and afterwards among the works of Spiegelburg and

ASELLUS, in Ichthyology, the name of a tribe or ge-
ner of fishes adopted by Willughby, Ray, and other old
writers on Natural History. Linnaeus arranges the fishes
of this kind in the GADUS genus; as for example: affinis ma-
fo of Aldrovandus, is gardus agletanus Lin. (Hodgson) af-
affinis niger of Ray, is gardus laetus Lin. (Bib.) affinis mollis
mow of Willughby and Ray, is gardus minutus Lin. (Poor),

ASELLUS, in Entomology, a specific name of the com-
on wood-kswe, or hog-kswe, as it is called in England. It
belongs to the OXICEUS genus. It is of an oval shape;
and has an obtuse tail, which is furnished with two simple
fles. This well-known creature delights in moit places,
but often, when times, in walls, in damp and rotten wood,
&c. The young are contained in a four-valved receptacle,
under the abdomen of the female.

ASELLUS, in Conchyliology, a species of Chiton, found
in the North seas, most frequently adhering to anguirs mod-
dious. The shell consists of eight valves, is very black,
convex above, with a yellowish dorsal spot on each valve.
Chemnitz, Gen. &c.

ASELLUS, a species of Cyprina, very common about
the Madeira islands. It is white, with three brown bands.
Linn. This shell is called Aellus also by Rumphius and
Arkengelius. The shape is oblong; and the brown bands
are bordered with yellow, or sometimes reddish.

ASEMOS, a species, from a negative, and ergo, a figer,
is an epithet applied to events that fall out contrary to all
appearance, and without any manifest cause.

ASENA, in Ancient Geography, a town of Spain, in the
territory of the Carpetani.

ASENI, a people of India, whose capital was Buchepula.

ASEPTA, in Medicine, a species from a negative, and
 ergo, to putrify; signifies any thing unpurified, or uncon-
certed.

ASER, in Geography, a town of Asia, in the Arabian
Irac, situated on the Tigris, eight miles west-north-west of
Baghur.

ASES, in Ancient Geography, a Scythian people, who
inhabited the vicinity of the Cimmerian Bosphorus.

ASFACA, in Geography, a town of Peria, in the pro-
vince of Mecran, 52 leagues north-west of Mecran.

ASFELD LAVILLE, a town of France in the de-
artment of the Ardennes, and chief place of a canton in the
district of Recht, thirteen miles north of Rheims. The
place contains 1880 and the canton 7852 inhabitants: the
territory includes 230 kilometres and 19 communes.

ASFON, or ASFON, a town of Egypt, four miles
orth of Ermnt. This is the site of one of the cities called
Aphroditopolis.

ASFUR, in Ichthyology, a species of Charrodon, found
on the coasts of Arabia. It is black, with a yellow tran-
versal lunar-wedged band. Fortik. In Arab. The same
author describes a variety of this fish, of a bluish colour,
with oblique bands, biotches, and fine lines of violet.

Length five inches; body oval, covered with rhombic scales,
diposited in a quinconx order, and finely dotted; a strong
spine on the gill-cover half an inch in length; lateral line
curved; dorsal and anal fin calcated; tail rounded, fulvous,
and edged with black.

ASGILLIA, in Ancient Geography, an island situated
in the Persian gulf, on the coast of Arabia Felix. Pliny.

ASGILL, John, in Biography, an English discoverer of
singular character, was born about the middle of the 17th
century, and educated at Lincoln's Inn, under Mr. Eyre, a
very eminent lawyer. His political talents and singular
mind of humour were manifested in two pamphlets, which
were printed in 1698, and which attracted public notice;
the first was entitled, "Several Assertions proved in order

4

..to create another Species of Money than Gold and Silver,"
and the second, "An Essay on a Registry for Titles of
Lands." These were followed, in 1700, by another whimsi-
ical and enthusiastic tracts, intitled, "An Argument,
proving, that, according to the Covenant of Eternal Life,
revealed in the Scriptures, Man may be translated from
hence, without passing through Death, although the human Nature
of Chrift himself could not be thus translated, till he had
passed through Death." This publication excited a general
clamour against the author as an infidel and a blasphemer.
Before this time he had removed into Ireland, and pursued
the practice of the law with so much success, that he was
enabled to purchase an estate, and to obtain a seat in the
Irish parliament; but this publication occasioned his expul-
sion from the house, as a person whose blasphemous writings
rendered him unworthy of representing a Chriftian people.
On his return to England, he obtained a return to the Bri-
tish parliament, in 1705, for the borough of Bamber in
Sussex, and held his seat for two years. But his want of
wealth involved him in debts which he was unable to dis-
charge; and during the interval of privilege, he was arrested
and committed to the Fleet prison. On the opening of the
next session of parliament, in 1707, he was demanded by the
fiercst at arms, released from custody, and resumed his
seat. However, his embarrassed circumstances, and the
consideration of his being a privileged debtor, created a
prejudice against him in the house, and a committee was ap-
pointed to examine his offensive publication, in order to jus-
tify the proposed measure of his expulsion. This com-
mittee reported that his book contained several blasphemous
expressions, and that it seemed to be intended for exposing the
scriptures; and though Afgill made a spirited defence, and
solemnly protested, that he published his treatise under a
firm belief of the truth of the scriptures as well as of his own
argument, he was expelled. In consequence of this mea-
Sure, as his debts increased, he was thrown by his creditors
into the King's Bench prison, where he remained thirty
years; furnishing himself with amusements and occasional
supplies, by writing pamphlets, chiefly political, against the
pretender, and by practising in the way of his profession.
Notwithstanding his misfortunes, and the confinements of
his own infatuation, he retained great vivacity of spirits, and
peculiar powers of entertaining conversation, till his death,
which happened within the rules of the King's Bench, in
1738, at the age, as some say, of 80, or according to others,
100 years. Afgill seems to have been a visionary and en-
thusiastic, rather than an infidel or blasphemer; and his ecce-

..tricities rendered him more the object of contempt or pity,

ASH, Common, Flowering, and Manna, in Botany. See
Fraxinus.

ASH, Mountain. See Sorbus. See Rhus.
ASH

Ash-Balls, are formed of the ashes produced by a low incineration of the green plants of fern, which contain a considerable portion of alkali, and are used in making lye for the scouring of linen. See FILIX. 

Ash-Tree, a tree of the deciduous kind, of which there are several species cultivated either for the sake of variety, or for the purpose of ornamenting pleasure grounds, &c.; but the kind which deserves attention here, is the common ash, so well known as a timber tree as to need no description. See Fraxinus.

The ash tree will thrive in barren soils, and in the bleakest and most exposed situations; but it grows to the greatest advantage on such lands as have a tolerable depth of soil, and on which water is not liable to stagnate. It is found to be of so hardy a nature, as to withstand the effects of the sea-winds; it may therefore be planted on the coasts where but few other kinds of trees are found to prosper. When planted on the sides of ditches, or in moist meadow lands, from the spreading of its roots it has been found to render the ground more firm and dry. From this, as well as other causes, it is, however, highly prejudicial when planted on arable land; it ought therefore to be chiefly planted on the waste nooks and corners of fields, or perhaps, on improveable swampy lands, and on the springy fides of hills, as it would not only render them useful as plantations, but, from the spreading of its roots, make them more firm and dry.

This fort of tree propagates itself plentifully by means of seeds, which being scattered in autumn in places where cattle do not come, plenty of plants come up in the spring. Where any person is defirous of raising a quantity of these trees expeditiously, the seeds should be sown as soon as they are ripe, and the plants will then come up in the following spring; but if the seeds be kept out of the ground till spring, they will not come up till the second year. The ground should be kept clean all the summer where they are sown, and not disturbed, let the seeds be turned out of the ground, or buried too deep to grow. When the plants are come up they must be kept perfectly clean from weeds during the summer months, and if they make good progress in the seed-bed, they will be fit to transplant by the following autumn; some ground should therefore be prepared to receive them, and as soon as their leaves begin to fall, they should be transplanted. In removing the plants, care should be taken not to break or tear off their roots; to prevent which, they should be taken up with a spade, and not drawn up, as is frequently practiced; for as many of the plants which rise first from seed will outstrip the others in their growth, as is a frequent practice to draw out the largest, and leave the others to grow a year longer before they are transplanted; and to avoid hurting those that are left, the others are drawn out by hand, and consequently many of their roots torn off or broken. It is therefore much the better way to take all up, little or big, together, and transplant them out, placing the large ones together in rows, and the small ones by themselves. The rows should be three feet asunder, and the plants a foot and a half distant in the rows. In this nursery they should remain two years, by which time they will be strong enough to plant out where they are to remain; as the younger they are planted out the better they will grow, so that where they are designed for use they should be planted very young, and the ground where they are raised should not be better than that where they are to grow. For when plants are raised in good land, and afterwards planted into works, they very rarely thrive well; on which account it is much the better method to make the nursery upon a part of the same land where the trees are designed to be planted, and then a sufficient number of trees may be left standing upon the ground, which will generally outstrip those which are removed, and grow to a larger size.

Where planters reside in the neighbourhood of ash-trees, they may supply themselves with plenty of self-sown plants, provided cattle are not frequently trodden on the land; and where the seeds fall in hedge-rows and are protected by bushes, the plants mostly come up and thrive well; in such hedge-rows the trees are frequently permitted to grow till they have deforested the hedge, for there is scarcely any tree so hurtful to all kinds of vegetables as the ash, as it robs every plant of its nourishment within the reach of its roots; it should therefore never be suffered to grow in hedge-rows, as the hedges are not only killed, but corn, or whatever is found near them, greatly impoverished.

If a plantation of this kind of trees be rightly managed, it will turn greatly to the advantage of the owner; for by the underwood which will be cut to cut every eight or ten years, there will be a continual income more than sufficient to pay the rent of the ground and all other charges, and still be a large profit for timber, which, in a few years, may be worth forty or fifty shillings, or perhaps even much more, per acre. In the sixth volume of the Bath papers, Mr. South observes, that the growth of ash, in soils adapted to its nature, is little inferior to that of elm or beech; but that there is no timber whatsoever that differs more in its value than this does, according to its situation. The productions of dry and healthy grounds will prove acceptable to most purchasers; those of woods are generally clean in the shaft, and more valuable than the former. The nearer the ground the rougher is the timber; the shaft therefore is coveted, the brittle branch is rejected; the buyers of this timber accepting the shaft and its continuation, or belt bough; the reit, be they ever so large, go with the top. When this fort of timber is raised in damp meadows or moorish soils, it becomes light, spongy, brittle, and of small value in comparison of that on dry and healthy spots. In meadows these trees will attain a size which cannot be expected in moors and bogs; for when the roots reach the peat, the bark grows soft, and the top decay; how long it lasts may be productive of poles in such situations, remains to be determined; but experience determines that ash thus planted will never become timber of any value, as the roots must perish before the tree arrives to perfection. If ash-trees get disbarked, though in appearance they should be flourishing, on being felled, the roots will be frequently found decayed, and the fems at bottom a complete hell; they ought not, therefore, in point of profit, to be suffered to stand. These trees, when they stand among firs and larches if planted close, will grow too tall and slender, but thrive well when planted alone. They are frequently known to have thriven for at least ninety years, as may be seen by their rings. But in the first ten years, as well as the half, the growth has been observed slow. It is remarked by Mr. Marshall, in his "Rural Economy of the Midland Counties," that in the intermediate years, the different thickness of the rings in different years were striking. This kind of timber is generally esteemed next in value to that of the oak, and in some places even nearly equal to it. It is of great value to the coach-maker, the wheelwright, and cartwright, for ploughs, axletrees, felloes of wheels, harrows, ladders, and other implements of husbandry; and also to the ship-builder, for oar-blocks, for pulleys, and many other purposes.

The best season for sowing this fort of timber is from November to February; for if it be done either too early in the autumn, or too early in the spring, the wood will be

ASH
ASHCUTNEY, or ASACUTNEY, a mountain of America, in Vermont, situate partly in the townships of Windsor and Westfield, and opposite Clarendon, on Sugar-river, in the state of New Hampshire. It is 2,253 feet above the sea, and 1,732 feet above the high water in Connecticut river, which runs by its western end.

ASHDOD, in Ancient Geography. See Azotus.

ASHDO'I-PIGGAH, a city in the tribe of Reuben, so called from נ技術, well-watered places, and situated in the fertile plains at the foot of Mount Piggah, or at the springs of Piggah; whence its name.

ASHENAGUR, a province of India, corresponding with the country of the Asaccani, in which Alexander warred, on the west of the Indus, situate at or near the conflux of the Penj-korch and Sewad rivers, and two marches from Bajore. The present Sivad is part of the ancient province Ashenagar. Kennell's Memoirs, p. 159.

ASHER, the son of Jacob, by Zilpah, gave deno- mination to one of the twelve tribes which was settled on the north-west of the province of Lower Galilee, in a very fertile country producing abundance of corn, and wine, and oil, of the best kinds, with Phœnicia west, mount Libanus north, mount Carmel and the tribe of Issachar south, and Zebulun and Naphtali east. It contained some considerable cities near the sea, but no sea-port of any note. This tribe never possessed the whole extent of district assigned to it, which was to reach to Libanus, Syria, and Phœnicia.

ASHER, a city of Palestine between Scythopolis and Shechem,—Also, according to Eusebius, a large town between Azoth and Ascalon.

ASHES, in Chemistry. This is a term of general import, which is applied to the pulverulent residue left after the combustion of any substance whatever. In this sense, the combustion of metallic bodies has been said to yield metallic ashes, but to these the terms calc and oxyd have been applied; and it is only vegetable and animal matters that are now said to afford ashes after burning.

To confume vegetable or animal fibubance to ashes, the free access of air is requisite, more particularly with the latter. Vegetable Ashes. When a vegetable is set on fire, a vast quantity of aqueous vapour first escapes, together with the component parts of most of the other vegetable principles, such as the native juices, the acids, the sugar, the oil, &c. which latter either burn with flame, or are driven off in a dense smoke. The more solid carbonaceous part requires a longer continuance of heat, and a free access of air for its complete combustion; but when this is effected, a certain portion of white or grey ashes remains behind, consisting of the fixed saline, the earthy, and the metallic ingredients. In general, it is found (as would be expected) that the watery, succulent, and herbaceous plants, yield a less quantity of ashes than the hard and woody parts of vegetables; but there are numerous exceptions to this rule, as the hardness of texture is more determined by the quantity of carbonaceous matter. A very violent heat either melts the ashes into a flag or scoria, or dilutes their saline ingredient, and leaves only the earthy and metallic; so that a certain management of the fire is requisite in order to procure the greatest possible quantity of ashes from vegetable matter.

From the saline ingredient are procured those very important articles in chemistry and manufacture, the fixed alkales, both vegetable and mineral; the former distinguished according to its species and purity by the terms wood-ashes, pearl-ashes, pot-ashes of commerce, full of tartar, or full of wormwood; the latter by the terms natron, barilla, kelt, and soda.
ASHES.

As the combustion of vegetables, when carried on in the large way, is always directed to the object of procuring the alkaline salt, and as this subject includes a variety of interesting observations, and the particulars of the analysis of ashes, we shall refer the whole of this article to those above mentioned, and especially to that of Carbonate of Potash and of Soda.

We may add, however, that though vegetable ashes are composed of fixed earths and alkalies combined with acids, and of some metallic oxides, especially those of iron and manganese, almost every possible variety of combination and proportional quantity of ingredients is to be met with, according to the nature of the plant, the composition of the soil, the season of the year, climate, and the like. In general, chemical analysis has detected the following substancess in vegetable ashes: fexs, magnesia, lime, potash, soda; the sulphate, carbonate, phosphoric, and muratic acids; and the oxides of iron and manganese. The most usual and important of these ingredients are, the sulphates of potash, soda, lime, and magnesia; the muriates and carbonates of the same, and the phosphates of lime. It is still a question, which of the faine ingredients represent the actual state of the vegetable juices, and which of them are formed by the process of combustion; the acid of the carbonates may with great probability be supposed to arise from the latter cause.

When the alkaline part of vegetable ashes has been separated by lixiviation, the light earth that remains, probably still mixed with a portion of sulphate of lime, is sometimes employed, after being well washed, for the formation of the large CUPELS used in the refining of silver.

The ancient alchemists paid considerable attention to the ashes of different plants; and some of the Rosicrucian school of deceived and deceiving impostors, pretended to be able, by a species of *polinsonfia* or re-production, to exhibit in the ashes of a plant a complete miniature representation of the gradual growth and maturity of the individual vegetable.

Animal Ashes. A very few words will be requisite on this subject taken separately. Animal matter is much more difficult of complete combustion than vegetable; the volatile part of each is driven off by heat without much difficulty, but the coal of animal substance is of very difficult incineration, often requiring a very long continued and violent fire. This is probably owing in part to the greater quantity of oxide of iron which, uniting with the carboaceous matter by the assistance of heat, forms a carburct of iron that burns with extreme difficulty. The feline and earthy parts almost peculiar to animal ashes are the phosphates of soda, phosphate of ammonia, and phosphate of lime, and often the carbonates of soda and lime. The proportion of earthy matter in bones, horn, and the harder parts of animals, is generally full one half the weight of the sub stance when fresh from the body; in bone it is almost entirely phosphat of lime, mixed however with a small portion of sulphate and carbonat of lime; in flesh the earthy part is principally carbonat of lime.

For further particulars concerning animal ashes we must refer the reader to the individual articles of animal matter; such as Blood, Bone, Hartshorn, Shell, and to the above-mentioned earthly and alkaline faults.

The only animal ashes employed in any extent in the arts are the fixivated ashes from bones, which when mixed up in water, and call in proper moulds, form the Cupels that are employed in ASSAYING and REFINING of gold and silver. The finer and whiter ash of calcined horn is employed in a small extent in medicine, under the term cornu cervi calcinatum, or calcined hartshorn.

ASHES, in Agriculture, the earthy or other particles of combustible substancess after they have been burnt in the fire. The beneficial effects of such matters, as manures, may probably, in a great measure, arise, on the deposition of alkaline saline matter which they contain, which by its action on, and combination with the materials that are present in soils, may render them more soluble and proper for the nutrition of plants. Considerable utility may also be derived from their operating medicinally, and in that way lessening the tenacity and stiffness of the heavier kinds of soils; and likewise by their absorbing powers in lands of the more moist kind. Ashes are of different sorts, as bluebars, after, coal after, peat after, pot after, foapers' after, turf-selves, wood after.

The first sort consists principally of the hard undissolved parts of pot-ash, kelp, weerd-ash, and barilla. Laid on land alone, they are too stimulating; they ought therefore, perhaps, never to be used but in union with earth, or earth and dung. It is said, however, they answer well with blood, garbage, and putrid animal substancess. They are generally laid upon followers for wheat. The greatest advantage derived from them is upon clays or deep loams. Upon rocky grounds, or coarse wet meadows, they will be found particularly useful, in destroying the coarse plants that infest them.

The second sort, or coal ashes, probably from their containing a portion of calcareous matter, are found to be highly beneficial on still and poor lands; for which purpose they are successfully used in the neighbourhood of many great cities, where coal is much burnt for fuel. They also open the texture of clayey grounds, and correct their tenacity, and other bad qualities. The gardeners and farmers about London know their value, and make a very profitable use of them; particularly in bringing into order those grounds which have been dug up for brick-earth. Mr. Bradley long ago, indeed, blamed the people of Staffordshire, and the countries adjoining, where there are coal-pits, for not improving their heavy grounds around them, by manuring them with coal ashes, which might be easily burnt out of the waste coals of such pits; and suggesses "that wherever there are plenty of coal-pits, there can be no want of good profitable land." Mortimer held the same opinion, elle-ming sea-coal ashes as the best manure of any for cold lands, as well as the most lasting and fittest to kill worms and flugs. And Worley looked upon them as an excellent compost, when mixed with horse dung; remarking, that they have great effects in removing moss and rithes in moist grounds. Ashes of this kind are employed in different proportions, in different places according to the particular circumstances of the crop, and the land on which they are applied. It is observed by Mr. Farey, in the Annals of Agriculture, that about Diabley they are used at the rate of from fifty to sixty bushels to the statute acre, for a complete dressing; and that they succeed, well fawn on clover, in March or April, on dry chalky lands. They have also much effect on fward-land, when applied during the winter or spring; but they are never used on wheat. It is likewise further remarked by the same writer, that in very dry reasons they do little service, except on cold fwards, which they invariably improve; and that on light land they require rain, after being fown or spread over the land, in order to promote their operation.

The ashes formed from peat, are found, from long experience, to be a very good manure. The author of Modern Agriculture remarks, that in many parts of the kingdom peat-earth cut and dried in the course of the summer, is the only fuel; and that the peat dug from the motts that are so firm as to bear cattle to tread on them, is the belt both
ASHES.

both for fuel, and afterwards for manure. The ashes of the
f rdr, or what is pared from the surface of heath and com-
mons by the cottagers in many parts, as about Bedford,
the, he says, of little value, when compared to those above
mentioned. It is probable that Berkshire is the only district
of Great Britain, where peat ashes, without the mixture of
any other substance, are at present generally used as manure.
The ashes of peat, dug from extensive meadows in that county,
have been proved by the experience of sixty or seventy years,
to be a most excellent manure, when used as a top dressing on
almost all kinds of crops; as oats, wheat, barley, turnips, clo-
ver, fairfround, meadows, pastures, &c. The quantity generally
used is about twenty bushels, more or less, as the condition
of the land seems to require; and the price about thre-
price, or four-pence a bushel. To such an extent is this
mode of manuring carried on in that county, that the
proprietors often receive two or three hundred pounds the
year for the liberty of cutting and carrying off peat to the
depth of five or six feet. It would be absurd to suppose,
says he, that the peat ashes of Berkshire are superior, as
manure, to those in every other part of the island; and as
their effects in that country, when applied to the soil, have
been conspicuous for a great number of years, it is certain
there is a circumstancy meriting the attention of those who reside
where peat is the only fuel, to ascertain whether peat ashes
in such districts do possess all the fertilizing qualities of
those in Berkshire. The experiment is easily made; all that
is necessary being to keep the ashes dry, and under cover
during winter; and to sprinkle them with the hand over the
crops in spring, at the rate that has been just mentioned.

Lord Dunsmuir, in his Treatise on the Connection of
Agriculture with Chemistry, however, remarks, that the
ashes procured from peat in the neighbourhood of Reading,
in Berkshire, seem to possess a fertilizing power infinitely
greater than ashes obtained from moat other peat. They
are, however, contain no alkaline salts; and in an
analyses made four years since, no saline matter, says
he, is re-collected to have been got from them, but a small
proportion of Epsom salt. Had these ashes, however, been
analyzed with more care, and when newly made, they
probably would, he thinks, have been found to contain a kept
of lime, a salt which is soluble in water; whilst gypsum, to
which it returns on exposure to the air, is infusible. To
this hepar, therefore, says he, may the fertilizing power of
these ashes most probably be attributed. And the writer of
the Survey of the County of Middlesex fugitively, that as
the hills on each side of the meadows which produce the
Newbury peat ashes, consist of chalk, easily dissociable by
heavy rains, which wash it off the ridges, dows the fur-
drows, ditches, and streamlets, to the low grounds, where
mixing with the ditches, it is floated over the meadows, and
deposited with the peat; consequently the peat of that dis-
trict differs from that of most others, by the quantity of
chalk which it contains, and that when dug, dried, and
burnt, the fire reduces the chalk to lime, and the rest to
ashes. Hence Newbury ashes are a mixture of lime and vege-
table ashes; and it is very probable, he thinks, that any
common peat ashes, or the ashes of rough grafs land, of
turf, heath, furze, ling, wood, &c. produced by the op-
eration of paring and burning, being mixed with chalk-dime
in due proportion, would be equally fertilizing as those
noted ashes. It is indeed been long since observed by Mil-
ler, that these ashes are greatly bettered by being mixed
with lime before they are put on the land. These ashes are
produced from land that is black and crumbly at the under
which lies the peat to the depth of several feet. They do
not burn the peat in the field by choice, because the peat
is burnt for ashes, when it cannot be dried for sale; and then:
it is burnt in large heaps, with a smothering fire, as is likewise
the superficial black earth, or moory soil, together with
the refuse of the peat. The ashes of these are laid up in
round or long heaps, rising at top like the sides of a
pond, in order to throw off the rain and keep them dry till they
are sold. Sometimes they are laid under dry fields or in hedges
to fume them from wet, which they cannot be wholly pro-
tected from by laying them up in ridges exposed to the
weather, into which the rain penetrates for some inches deep; but
these ashes are never so good manure as those that are kept
dry. Near the surface of the peat earth there is sometimes
a bed of whitish earth called murn, which is a composition
of earth and very small rocks of the periwinkle kind; this
is also burnt to ashes for manure, and the quantity of it in
some places is to great, that the ashes are of a whitish colour,
while those from the peat or moorish earth are reddish.
The white are esteemed to be as good manure as the red;
and being a kind of shell-marl, would make good manure
without being burnt; as indeed they rarely are thoroughly,
though they seldom lay them upon land till they have passed
the fire, or are mixed with the ashes of the peat-earth.
The ashes of the peat field for fuel, and burnt in chimneys,
are much stronger manure than the ashes burnt in the field;
and if care be taken to keep them dry, are sold for nearly
double the sum of the field ashes. Mr. Fawcet states, in
the Annals of Agriculture, that he has found field ashes to
improve the chalky soils about Dunstable, but on the wet
lands, or cold swards, and hot sandy lands, they did little
good. They may be employed on the same kinds of crops,
in the same way as coal ashes, and also on the wheat crops
about April. But Mr. Middleton says that he has tried
the Newbury peat ashes on wheat, tares, and me-
dows, and produced much good manure, than with
any fertile effect. In Norfolk, ashes are not in estimation
as manure; even those of the heath are in some degree
neglected. But the meadows and fens abound with peat-
holes, which in some places would be considered as inevi-
table sources of manure; and the peat earth in these
meadows, when burnt, would no doubt afford an ample
supply of ashes. In many places, much advantage has been
supposed to arise from the practice of mixing lime with
peat ashes before they are applied to the ground.

The refuse, or ashes, remaining after the burning of differ-
ent green vegetable matters from which the alkaline salt
called pot-ash has been extracted, is a kind of ashes which
has been found of great service to most sorts of land; but as
they have been in a great measure deprived of their saline
property, it is necessary to lay them on much thicker than
any other sort of ashes. Mr. Bradley affords that a buchel
and a half of these may be used in the room of a buchel of
fresh ashes; and that they should always be mixed with some
other light ingredient which may be used in any quantity
when laid on very stilt land; but if the land be not over
stilt, they may be laid on it with less mixture. As in places
far removed from the means of improvement, a substitute for
common manures, that is of easy carriage, and can be laid
at a moderate expence, must be valuable, pot-ash may be em-
ployed; for, from experiments that have been made, it ap-
ppears that two hundred pounds of it are sufficient for an acre
of strong land. For lighter soils much less is required, if
laid on by itself; on these, however, a compost of this and
train or refuse oil incorporated with mould, will be the best
way of employing it. Upon strong clays and deep loams,
however, it ought always to be applied by itself. When
the expence of carriage is considered, this will often be
found a cheaper manure than lime; and in one respect it
ASHES.

is superior, for the union of potash with all the different acids forms a neutral salt which is in some degree useful in vegetation; whereas when lime meets with vitriolic acid, it is almost entirely lost to the purposes of agriculture. A considerable part of what is used in manufactures (glass excepted) may be useful as a manure, after the purposes of the different manures have been served. Particularly in bleaching, the alkali of which will be found improved in consequence of the mucilage or oil which it has imbied from the cloth or other matters.

The soapers' ashes are a composition of wood ashes and lime, remaining after the soap-makers have drawn off their lye. These are in general a very valuable manure; but there is great difference in the quality and effects of them. Tho' from wood ashes the weakest sort, as, wood ashes being very light and porous, their flats are soon dissolved, and extracted by the lye; so that there remains but a very slight portion of salt in the ashes. But when the soap-boilers make use of kelp instead of wood ashes, the kelp, from its being a harder nature than wood ashes, is not so easily separated and dissolved by the lye; consequently, much more of the saline matter remains in the ashes. The soap-boilers also make use of another kind of potash called barilla, which is imported from Spain and other places in large lumps, and which is much harder than common potash; and though they break this sort very small, and sometimes screen or sift it, much more salt remains than when pot-ash is employed; so that the ashes from barilla are for the most part stronger than any other; and if the same quantity of them were laid upon land as is commonly the cafe with wood ashes, they would burn and destroy the crop. Farmers should therefore use soap-boilers' ashes with caution, till they know their qualities and strength. Wood ashes and pot ashes are used in various places for making soap; but in and near London, very little of any thing but barilla is employed. The ashes from the barilla are a strong rich manure, and sold at five shillings per cart-load. They are not now however so good as they were formerly, the soap-makers having found means to extract more of their salt from them; as they also take the salt from the lye which was formerly rather superior to the ashes as a manure, and be had for nothing, being all thrown away as ufeless.

This excellent manure was first used by the Flemings with great success. Two loads of these ashes are sufficient for an acre of arable land. They should be laid on the ground when the weather is inclined to be moist, in order that the rain may more easily dissolve and wash them in. As soapers' ashes principally come in of lime, which is used by soap-makers to deprive the alkaline salts of their fixed air, the addition of lime to the ashes is unnecessary. They are used to most advantage when made into compoils with earth and well-fermented dung in the proportion of two loads of dung to one of earth; the ashes being then added in the quantity of one load to ten of this mixture, turning and incorporating the whole completely. The quantity necessary for strong clays or deep loams is ten cart loads to an acre. If the dung has been well fermented, perhaps the most profitable way of using this compoil may be as a top-dressing; harrowed in with the grain, taking care, however, that the caustic quality of the ashes be properly blunted by a sufficient mixture of dung and earth, or rich earth only. Thence ashes, when best small, may be made into a rich compoil with refuse oil and earth, and used as a top-dressing for young crops. They will destroy flags and vermin of every description, and are therefore highly valuable on lands where the early wheat is injured by the worm. Laid upon grass lands in the end of autumn, this manure, it is said, produces a deep verdure during the winter, and an early vigorous vegetation in the spring; it is therefore particularly calculated for cold wet pasture lands.

In respect to turf ashes, produced by burning turf or the paring of the surface of heathy, moorish, and other lands, their utility as a manure, perhaps, chiefly depends upon the quantity of alkaline salts matter which they contain, and which is produced by the burning of the fresh vegetable substances of turf, and the combination of vital air or oxygen, with the clayey part of the soil during the process of combustion, as well as by the mechanical action of such substances on the tenacious earthy matters of the soils. According to the Rev. Mr. Comber, the ashes in the moors of Yorkshire are carried out daily, or once in two or three days, to the dung-hill; and the farmer takes the opportunity of his first leisure towards the end of the year, to carry them out to his meadow lands on which he lays them thicker or thinner as he has more or less land which he apprehends to want them, and more or less of them. The first rains wash them in, and the next summer never fails to show their good effects. It would however be probably a much better practice to apply to the land in the early spring when the weather is rather wet, and not to leave them to be washed away by the heavy rains and land-floodes during the winter months. They would also be much more efficacious if kept in fields, or other suitable places, instead of being carried out to the dung-head; where the rains must dissolve and carry away their most nutrient properties; as these ashes are much finer or more pulverized than those of coal, they may infallibly themselves more into the soil, but they are probably not so falling in their effects. Of the truth of this a remarkable instance is mentioned.—A field, wherein the soil was a poor gravel, that had a crop of the broad or red clover growing upon it, was drenched, one side of it with peat ashes, and the other side with turf ashes. The farmer had upon this field all the ashes he had of these two sorts, and the middle of the field had no dressing. The clover in the middle part not drenched was a very poor crop, the plants being short, yellow, and flinted; the side drenched with turf ashes was much better than the middle; the plants being taller, of a better colour, and promised to be double the crop of the undrenched part; but that side drenched with peat ashes produced a crop that appeared to be as much superior to the part drenched with the turf ashes, as this field was superior to the middle that had no dressing at all. The ashes were foun upon the clover by hand, and the improvement made upon the clover was so great, that the caul of the flower's hand was extremely plain next to the middle, and appeared like an indurature; and the vigour of the plants there was for much greater than the undrenched plants, that the extent of the peat ashes might be plainly distinguished almost an inch. This observation was however made in the beginning of summer, before the clover had arrived to its full growth. See Paring, and Burning.

Ashes produced from wood and moss green vegetable products contain a considerable quantity of fixed alkaline salt blended with the earthy particles; but none or very little can be produced by the combustion of dead or decayed vegetable matters. It is from the ashes of the former kinds of vegetable matter that the alkaline salts called potash and pearl-ashes are commonly extracted. It seems also probable, from the observations of the earl of Dundonald, that the effects produced upon land by the application of the ashes of fresh vegetable products, arise from the vegetable alkaline salt which they contain, which, by its action on what he terms the oxygenated or inert mould or earth of the soil, renders it soluble, and more suitable to the nutrition of plants,
plants. As the saline matters contained in these substances are liable to be bisulphated and carried away by moisture, they should always be kept dry and free from water, either by means of sheds or other conveniences. It has been long ago observed by Mortimer, that one load of dry ashes will go as far as two tons kept for; but though rain-water diminishes their salts, so the moistening them with chamber-lot or soap-suds will add greatly to their strength. Two loads of these ashes will manure an acre of land, better than six loads of those that are exposed to the rain, and that are not ordered for, which is the common allowance for an acre, though some lands require more, and some less. That the ashes of any sort of vegetables are very advantageous to land, is what is experienced in most parts of England, by the improvement that is made by burning of furze and flabbe, starw, heath, furze, fudge, bean-dails, &c. Mr. Young, in the first volume of the Annals of Agriculture, approves of charcoal-ashes, in preference to powdered charcoal itself. And wood ashes mixed with mud (he says) are superior to ashes alone, and four times better than mud alone, as a manure. In the second volume of the same useful work, he adds, that wood ashes appear to be a most powerful manure. In a neighbourhod abounding with vitriolic acid (he says), they more than neutralise that salt; they furnish, besides, the food of plants. In neutralizing it, the fixed vegetable alkali they contain forms with the acid a vitriolated tartar, which is beneficial to vegetation. From the alkaline matter contained in ashes, and its known operation on earthly substances, they may probably be used to great advantage in combination with good mould or earthy materials, and dung, in the proportion of one load of ashes to ten of the compost; and this may be applied to tillage-lands as well as those under grass, in their simple state; but in the former they would seem to be the most proper, when confounded with other matters, such as have been mentioned above. They may, when employed in the unmixed way, be sown upon the surface, and harrowed in with the crop to which they are used. But in whatever way they are made use of, they should be spread out as equally as possible on the land. Moit grass-lands are improved by their application, but more especially those that are wet, and given to the production of wild fowls, rats, or other coarse plants of the same kind. When used in the way of compost on tillage lands, they are generally laid on at the rate of about ten or twelve loads to the acre, but on pasture or grass-lands, the quantity applied varies very considerably, as from one hundred to one hundred and sixty bushels. These substances have been found highly useful, when sown on the green wheat and clover crops in the spring, and also when harrowed in with turnip seeds, or sown over the young plants when they first appear, as by this practice the ravages of the fly are laid to be greatly lessened in many cases. See MANURE.

ASH, Volcanus. See Volcano.

ASHFIELD, in Geography, a townhip of America, in Hampshire county, Massachusetts, about 15 miles north-west of Northampton, and 177 miles west from Boston; containing 1,450 inhabitants.

ASHFORD, a town of England, in the county of Kent, seated on the river Stour. It has a monthly market for cattle on the first Tuesday, and a weekly market on Saturday for corn, &c. It is distant 45 miles E.S.E. from London. N. lat. 51° 15'. E. long. 0° 45'.

ASHFORD, a township of America, in Windham county, Connecticut, incorporated in 1710; distant about 38 miles north-west from Hartford, and 76 south-west from Boston.

ASHFORD, New, a township of America, in Berkshire county, Massachusetts, 155 miles west from Boston; containing 450 inhabitants.

ASHKENAZ, in Ancient Geography and History, one of the sons of Gomer, is supposed to have settled near Armenia, in the eastern part of Asia Minor; or towards the north-west of that continent; for it is said, that with reference to his name, there was in Bithynia the Acesian lake, a river called Aceseus, and a bay of the same name; and in Leifer Phrygia there was a city called Acesius, with ill-s called the Acesian islands; and it is further observed, that besides Acesius, the son of Aesopus, Homer mentions a king of that period who was at the siege of Troy; and as a proof that the Ashkenaz, mentioned by Jeremiah, were people of these parts, it is shown from Xenophon, that Hylates having conquered Phrygia, that lies on the Hellespont, brought thence many of the horses and soldiers which Cyrus carried with him to the siege of Babylon. Moreover, the Pontus Euxinus, or Acesius as the Greek first called it, is supposed to be a corruption for the Ica of Ashkenaz.

ASHKOKO, in Zoology, a very singular kind of quadruped, described by modern naturalists under the names of Syrian hyrax, hyrax syriacus, and brizby cavy; for a full and accurate description of this species we are however indebted to that indefatigable and learned traveller, Mr. Bruce, who observed it in several parts of Abyssinia, and gives us the following account of it in the Appendix to his Travels. "This curious animal," says Mr. Bruce, "is found in Ethiopia, in the caverns of the rocks, or under the great stones in the mountain of the sun, behind the queen's palace at Kofcam. It is also frequent in the deep caverns in the rocks in many other parts of Abyssinia. It does not burrow or make holes as the rat and rabbit; nature having interdicted him this practice by furnishing him with feet, the toes of which are perfectly round, and of a soft pulpy, tender substance; the fleshy parts of the toes project beyond the nails, which are rather broad than sharp, much similar to a man's nail ill grown, and these appear rather given for the defence of his soft toes than for any active use in digging, to which they are by no means adapted. Its hind foot is long and narrow, divided with two deep wrinkles or clefts in the middle drawn across the centre, on each side of which the flesh rises with considerable protuberance, and it is terminated by three claws; the middle one is the longest. The fore-foot has four toes; three of them in the same proportion as the hind-foot; the fourth, the largest of the whole, is placed lower on the side of the foot, so that the top of it arrives no farther than the bottom of the top of the toe next to it. The sole of the foot is divided in the centre by deep clefts like the other, and this cleft reaches down to the heel, which it nearly divides. The whole of the fore-foot is very thick, fleshy, and soft, and of a deep black colour, altogether void of hair, though the back or upper part of it is thick-covered, like the rest of the body, down to where the toes divide, there the hair ends, so that these long toes very much resemble the fingers of a man. "In place of holes, it seems to delight in less close or more airy places, in the mouths of caves, or clefts in the rock, or where one projecting, and being open before, affords a long retreat under it, without fear that this can ever be removed by the strength or operations of man. The ashkoko are gregarious, and frequently several dozens of them sit upon the great stones at the mouths of caves, and warm themselves in the sun, or even come out and enjoy the freshness of the summer evening. They do not stand upright upon their feet, but seem to dwell along as in

K

ASHIRT, Volcanus. See Volcano.
ASH

fear, their belly being near close to the ground, advancing a few steps at a time, and then pausing. They have something very mild, feble, and timid in their comportment, are gentle, and easily tamed; though when roughly handled at the first, they bite very severely.

"This animal is found plentifully on mount Libanus: I have seen them also among the rocks at the Pharar promontorium, or cape Mahomet, which divides the Elasitic from the Heropolitic gulf, or gulf of Suez. In all places they seem to be the same; if there is any difference, it is in favour of the size and fataes which thee in the mountain of the fun seem to enjoy above the others. What is his food I cannot determine with any degree of certainty: when in my poiffession he ate bread and milk, and seemed to be rather a moderate than a voracious feeder. I suppose he lives on grain, fruit, and roots. He seemd too timid and backward in his own nature to feed upon living food, or catch it by hunting.

"The total length of this animal, as he fits, from the point of his nose to the extremity of his body, is seventeen inches and a quarter: the length of his foot, from the extremity of the nose to the toe, is three inches and three eights; his upper jaw is longer than his under; his nose stretches half an inch beyond his chin. The aperture of the mouth, when he keeps it close, is round, no more than an inch. The circumference of his foot round both his paws is three inches and three eights; and round his head just above his ears, eight inches and five eights; the circumference of his neck is eight inches and a half, and its length one inch and a half. He seems more willing to turn his body altogether, than his neck alone. The circumference of his body, measured behind his fore-legs, is nine inches and three quarters; and that of his body, where greatest, eleven inches and three eights; the length of his fore-leg and toe is three inches and a half; the length of his hind thigh is three inches and one eighth, and the length of his hind leg to the toe, taken together, is two feet two inches; the length of the foot-foot is one inch and three eights; the length of the middle toe five lines, and its breadth six lines also. The distance between the point of the nose and the first corner of the eye is one inch and five eights; and the length of his eye from one angle to the other four lines. The difference from the fore angle of his eye to the root of his ear is one inch and three lines; and the opening of his eye two lines and a half. His upper lip is covered with a pencil of strong hairs for muttonchae; the length of which is three inches and five eights, and those of his eye-brows are two inches and two eights. He has no tail, and gives at first fight the idea of a rat rather than of any other creature. His colour is a grey mixed with a reddish brown, perfectly like the wild or warren rabbit. His belly is white from the point of the lower jaw to where his tail would begin if he had one. All over his body he has scarted hair, strong, and polished like his muttonchae; there are for the most part two inches and a quarter in length: his ears are round, not pointed: he makes no noise that ever I heard; but certainly chews the cud. [Dr. Shaw observes, that this particular of the ashhoko seems very doubtful, and may possibly be owing to the peculiar motions of the mouth resembling those of the hare, which has also been suggested by some to ruminate. Gen. Zool.] To discover this was the principal reason of my keeping him alive: thofe with whom he is acquainted he follows with great affinuity. The arrival of any living creature, even of a bird, makes him leek for a hiding-place; and I shut him up in a cage with a small chicken, after omitting to feed him a whole day; the next morning the chicken was unhurt, though the ashhoko came to me with great signs of having suffered with hunger. I likewise made a fecond experiment, by inclosing two smaller birds with him for the space of several weeks; neither were thee hurt, though both of them fed without impediment of the meat that was thrown into his cage; and the smallest of thee, a mouse, feem'd to be as familiar with him, though I never saw it venture to perch upon him, yet it would eat frequently, and at the same time, of the food upon which the ashhoko was feeding; and in this confillted chide the familiarity I speak of, for the ashhoko himself never shewed any alteration of behaviour upon the presence of the bird, but treated it with a kind of absolute indifference. The cage indeed was large, and the bird's having a perch to sit upon in the upper part of it, they did not annoy one another.

"In Amhara, this animal is called ashhoko, which, I apprehend, is derived from the singularity of those long herimacous hairs, which, like swet therms, grow about his back, and which, in Amhara, are called ashhok. In Arabia and Syria, he is called Israel's sheep, or Gannin Israel, for what reason I know not, unless it is chiefly from his frequented the rocks of Horeb and Sinai, where the children of Israel made their forty years' persecution; this name obtains only among the Arabians. I apprehend he is known by that of Saplan in the Hebrew, and is the animal erroneously called by our translators cuniculus, the rabbit or coney." Bruce, Appendix.

M. Schreber, who names this animal *hyrax syriacus* gives it this specific character: *H. plantis tridactylis, ungulibus omnis fublequulis. (Fect tridactyle, with all the claws nearly equal.)* To this Dr. Shaw, in his Zoology, adds, that it is rufous-grey, and white beneath. Gmelin also has *hyrax syriacus, pedibus unguiculatis.* See *Hyra syriiacus.*

ASHLAR, a term used among Builders, by which they mean common or free stones, as they come out of the quarry, and of different lengths and thicknesses.

ASHLEP, in *Arb. culture,* a term sometimes applied to foapers' ahes or walk. See *Sapiente Ashes.*

ASHLIERING, among Builders, a species quartering, to both, in garrets, about 2 or 3 feet high, perpendicular to the floor, up to the underside of the rafters.

ASHLEY, in *Geography,* a river of North America, which runs into the sea on the south-west side of Charlestown, in South Carolina.

ASHMORE, Elias, in *Biography,* an eminent antiquarian of the 17th century, was born at Litchfield in 1617; and at the age of sixteen was received into the family of his kinfman James Paget, esq. a baron of the exchequer, where he studied the law and other branches of knowledge. Having married in 1638, he settled in London as an attorney; but on the commencement of the civil war, his wife being dead, he entered into the king's service, and was employed in the department of the Ordnance, first at Oxford, and afterwards at Worcester. At Oxford he became a student of Draven-nofe college, and directed his attention to mathe-ematics, natural philosophy, and astronomy. From the study of the latter important and useful science he deviated to that of astrology, to which he seems to have been much addicted. In 1646, he was admitted into the society of free and accepted malons, and his election into this society was confirmed by him as a distinguihing mark of his life. His valuable collections very much contributed to the illustration of its history in this kingdom. Upon the surrender of Wor- cester to the parliament in this year, he withdrew first to Cheshire, and afterwards came to London, where he formed
ASH

ASH

in 1647, he retired to Englefield in Berkshire, and applied to the study of botany. Here he became acquainted with a rich widow, whom he married in 1659, and then removed with her to London, where his house was a place of resort for all the profligates in the curious and occult sciences. Having acquired from an adept in Berkshire a taste for alchemy, he published, under a feigned name, a treatise by the famous Dr. Dee, and another by an anonymous author, on this subject; and with great labour and expense he made a collection of the MSS. works of English chemists, which he published in 1652, under the title of "Theatrum Chymicum Britannicum;" in 4to. Having brought to a favourable termination some legal disputes occasioned by his wealthy marriage, he devoted himself with singular fidelity to the study of antiquity and the perusal of records; and relinquishing hermetic philosophy with a preface to a treatise on the philosopher's stone, which he edited, he began to make collections for the work which continued much more to his literary reputation, than any of his alchemical and chemical pursuits, and this was his "History of the Order of the Garter." As he was fond of the study of botany, he chose for the place of his residence the house of John Tradescant, a scientific gardener of Lambeth; and became possessor of the collection of rarities that had been made by Tradescant and his father, and which was conveyed to Mr. Ashmole, by a deed of gift, in 1679. On the restoration, Ashmole was particularly noticed, on account both of his loyalty and learning, by the king, who appointed him Windsor herald, and committed to him the description of the royal medals. He was also made a commissioner, and afterwards comptroller of the excheque; he was called to the bar in the Middle Temple, admitted a fellow of the Royal Society that had been recently established; presented, by the university of Oxford, with the degree of doctor of physic; and promoted to other offices, both honourable and lucrative. Upon the death of his second wife, he married the daughter of his friend Sir W. Dugdale. In 1672, he prefaced to the king his book "On the Order of the Garter," intituled "The Institutions, Laws, and Ceremonies of the Most Noble Order of the Garter, collected and digested into one body;" and printed at London in folio, in 1672. In 1679, he resigned his office of Windsor herald, and declined accepting that of garter king at arms, on two vacancies which occurred. His valuable library, which he had been thirty-three years in collecting, and also his cabinet, consisting of nine thousand coins, and many curious antiquities, were destroyed by a fire, which happened in the chambers adjoining his own, in the Middle Temple; but his MSS. and gold medals were preserved at Lambeth. When the university of Oxford had founded an edifice for a museum, in 1683, Mr. Ashmole lent thither his Tradescant collection of rarities, with the additions which he had made to it; and he afterwards added to this donation, his books and MSS. Thus commenced the "Museum Ashmoleanum," now subsisting at Oxford. Mr. Ashmole, having attained the 76th year of his age, died in 1692, and was buried in the church of Great Lambeth. Some few of his numerous MSS. chiefly on antiquities, have been published since his death; and also "A Diary of His Life," written by himself. His rank in literature and philosophy may be estimated by the brief account that has now been given of his researches and pursuits. Whilist a sober judgment will hesitate in admitting the extravagant panegyric of the "Biographia Britannica," which records him as "one of the greatest men in the last century," he will be allowed to have possessed, in a high degree, industry, perseverance, curiosity, and exactness; and "Anthony Wood," says one of his biographers (see Aikin's Gen. Biog.), "in his quaint language, has perhaps not ill characterized him,—the greatest virtuoso or curioso that was ever known or read of, in England, before his time." Biog. Brit.

ASHMOT, in Geography, the principal harbour in Isle Madame, which is dependant on Cape Breton.

ASHMOUNINE, probably, says Bruce (Trav. vol. i. p. 91.), the ancient Latepoli, a large town of Egypt, which gives name to the province. See Achmounain.

ASHMUN-TANAH, a town of Egypt, on a canal, between the Nile and the lake of Tennis, twelve miles east of Manofra, and twenty south of Damieta.

A-SHORE, in Nautilic Language, a term signifying on the shore, as opposed to a-board. It also means a-ground.

ASH-PIT, is the lower part of any air-furnace, which serves to receive the ashes of the fuel as it is consumed, and in general to supply the air necessary for the combustion. See FURNACE.

ASHUELOT, or ASHVILLE, in Geography, a small river in America, having many branches, whose most remarkable source is at the north end of the Sunapee mountains, in New Hampshire. It runs south-wardly through part of Cliffton county; below Wincheller, its course is west by north, and it discharges itself into Connecticut river at Hulsdale.

ASHUR, in Ancient Geography and History, the second son of Simeon, occupied at the disposition the country called after his name, and by the Greeks Assyria, at present Curdistan, or the country of the Curdas. Ptolemy supposes that he was driven out of Shinar by Nimrod, the grandson of Ham; but however this be, it seems to have been Ashur, (Gen. x. 11.), and not Nimrod, who went out of Shinar into Assyria, and built Nineveh, and other cities; and thus Pericormus maintains, that the text ought to be understood. See ASYRIA.

ASH-WEDNESDAY, the first day of Lent, supposed to have been so called from a custom in the church, of sprinkling ashes on the head of penitents then admitted to penance.

ASIÀ, in Geography, one of the four grand divisions of the earth, and the second in order, though the first inhabited. It is separated from Europe by the Mediterranean, the Archipelago, the Euxine, the Palsus Meotides or sea of Azot, the Don, and the Drina; from Africa by the Red sea and the illusms of Suez. On the other sides, it is surrounded by the Great South sea. It does not join to America. Its principal parts are, Arabia, Asiatic Turkey, Persia, India, Tartary, Asiatic Russia, China, Japan, the

K 2 kingdom
kingdom of Ava, that of Siam, the island of Ceylon, and the Sands islands, whereof the chief are Sumatra, Borneo, Java, Celebes, the Moluccoes, the Philippines, and Maldives. Asia, according to Mr. Pinkerton, extends, in length, from the Heil-pont to what is called the East cape; that is from about the twenty-sixth degree of longitude, east from London, into the other hemisphere to near 180 degrees of east longitude, or 170 degrees west from London; being no less than 164 degrees, or (taking the degree at a medial latitude) more than 6500 geographical miles. From the southern cape of Malacea, to the Severofolothomuo-ofs the northern cape, now called the cape of Taimura, which bears the ice of the Arctic ocean, the breadth extends from about the second degree of northern latitude, to about the twenty-seventh, or nearly 5700 geographical miles. If, for the sake of a rude and merely comparative calculation, one-sixth part be added for the difference between the flat and geographical mile, the length of Asia in British miles would be about 7583, and the breadth 5250.—Under their proper heads, will be found the names of the places it contains, and each general accounts of them as the limits to which we are confined on this frontier will allow. We shall content ourselves then with relating the result of the latter observations of the academy of sciences at St. Petersburg, of the latitude and longitude of the following places in the north of Asia:

Unalakha, by the general map of Russia, lies in 68° of latitude from Ferro, 223° of longitude; and from Greenwich, 205° 25'. The same place, according to the chart of Krentzin and Levathé, is in 53° 30' latitude, longitude from Ferro 205° 30', from Greenwich 187° 55'; the longitude from Ferro to Greenwich being computed at 17° 34' 45'.

If the ancients had to flight a knowledge of the southern countries of Asia on the side the Gauges, we ought not to be surprised if what they have been able to hand down to us concerning the hyperborean regions, coasts, and seas, or the northern extremities, should be considerably more; and it must have been merely by chance that they obtained some slight knowledge of Cape Tabin and of the island Taztata; as we have learnt a few uncertain notions about the vast lakes towards the west of America, from savages taken prisoners, and others, and from vague report, with which we are obliged to be satisfied for want of better information. It was impossible to acquire any more authentic except by the means of the Ruffians, with whom, till the fourteenth century, we were scarcely any more acquainted than with the savage inmates of those northern coasts. Nay, had it not been for the Ruffian, Anika Stragano, who formed speculations for profiting by the lucrative commerce which the Samoyedes carried on at Moscow, in peltries brought from countries beyond them, Siberia, properly so called, would have remained a great while longer unknown to the Ruffians themselves. Thus, as a third for riches had been the chief motive that excited the Spaniards to the discovery of America, and attracted the attention of other maritime nations to that quarter, by the same greediness of gain occasioned the discovery and conquest of northern Asia, a country till then unknown to the Europeans. The first foundation of this conquest was laid by the celebrated Yermak Timofeiyf, at the head of a band of adventurers, left civilized, though not to inhuman, as the conquerors of America. By the accession of this vast territory, now known by the name of Siberia, the Ruffians have acquired an extent of empire, never before attained by any other people. (Tooke's View of the Russian Empire, vol. i. p. 324.) It was however owing to Anika Stragano and his comrades, that this conquest was undertaken, who also showed the way to subjudget, by degrees, further distant nations. The Ruffians themselves became known to the Europeans, through the voyages undertaken by the latter. The English and Dutch obtained from him occasion of them while in quest of a north-east passage; they learnt of the Samoyedes that the little ice froze over in winter, but the great ice was never frozen; that they went thither to fish between the mouths of the Pianida and the Yenifey; that opposite to the east and north point of Nova Zemla, was another, making a great fall angle, from which the coast afterwards declined towards the east and south-east, nearly to the hot countries. Here we see to what a small matter was confined the knowledge at that time obtained of the northern part of Asia, and the only materials from which they could lay down their charts. They were puzzled how to reconcile these statements, and the more, as the coast between the Pianida and the eastermost point of its cape was unknown to them. Some knowledge of it by land had indeed been obtained; and even the coast of the sea to the westward of it as far as its mouth, are filled with simories, or winter-huts, confidently peopled; but those inhabited beyond that little river were to indistinctly known to them, that they thought it best to mark them down in an indeterminate manner. They recontinued thus: Cape Tabin must form a fine terra, the extremity of Asia towards the north. There is a sea that washes all those shores; and we are assured there is another that divides Asia from America: these two seas therefore must join, and at that place form an angle, which will prove to be this Tabin; having an island to the westward which they laid down as lying at the mouth of a river. This notion, notwithstanding the numerous discoveries that might have destroyed it, has always subsisted, under one form or another, to the very times in which we live. Some, building on the report of the Samoyedes, marked the coast from the cape to the Taimura, as declining gradually towards the south-east. Others, willing to reconcile one with the other, laid down this declension only to the Lena, at its mouth, having got intelligence of some islands there; accordingly they carried the coast north-eastward, for the sake of preferring this Tabin. On learning that the Ruffians and others regarded Svetoi-nofs as the most advanced promontory, they gave its name, or Promontorium Sacrum, to the pretended Tabin. Afterwards, being informed that this Svetoi-nofs lay to the call of the Lena, they marked it accordingly; and hence were more firmly persuaded, that the ilks at the mouth of that river were thofe of Taztata; while, on the other hand, they perverted in the idea of a cape fines terra, which they left filling under the names of Tabin (which we shall continue
to ufe while (peaking of it in this fect.), Sweito-ofis, Caput
Sacrum, Tinehchath.ofis, Thinehchath.ofis, &c.

Strahlenberg notices this cape in a striking manner;
and the navigators of the eighteenth century, likewise, even
so early as Linschotten and his contemporaries, were per-
founded that it was not other than that prominent angle
laidwards the Taimura: indeed it is the most advanced cape
of that coast lying beyond the 77° or in 78°, and there-
fore the furthest towards the north. But Strahlenberg at
the fame time points out the Ifle of Tazzata, which he proves
to be Novaya Zemlya, since the ancient Sevthians and their
successors began with the northern nations of Europe, by
the river Taas, whence they denominate the great gulf
to which we give the name of Oby, the gulf of Taas, and from
which Novaya Zemlya, fituate over against it, was called
Tazzata. This is so natural, and can be the lefs doubted
of, as that island always been reputed as lying to the
walt of Cape Tabin, near the mouth of a river. Whence
Strahlenberg concludes, that thofe geographers who mark
it more to the ear are greatly mistaken, "luc alpium Tazzata
infula Phaino poiter."

After the conquest of Siberia, ftome Ruffians fell upon
the fena. as relations as Aukuta Stragorno and his companions
had done concerning the wealth that might be drawn from
thee oriental parts by the articles of peltry, on going
direct to obtain them, either by the chace or by commerce;
several companies were accordingly formed of people who
were then, and are still known by the name of Promyfcelen-
denzy.

They confidered that the method of making the greatt
profit poifible would be by going to sea coaitwise, and traff-
ficking with those unknown tribes, who, being ignorant of
the value of their peltries, would give them for a low
price. In this they were not deceived: and, notwithstanding
the great risk they ran, as their veffels were flcall and
cracy; as they were no lefs unfatisfed in the art of navigating
than in managing them; as in not venturing far from
shore, they were in propery every moment of foundering
among the ice; yet the thift of vice was too strong to
prevent them from being detained from their projects; and
the government was well satisfied with them, as they fur-
fished it with the means of rendering all these people trib-
batory.

They began their coours from Yakutik about the year
1656; proud of flag in this manner by rap, they every
year about discovered one new river, one new cape, that
Yenese, the Indigirka, the Alafka, the Kovyma. No fanner
were they came to the laft of these rivers, than their
curiosity was exceded to know what other streams might
be beyond it, in the two-feald view of rendering the nations
bordering on them tribatory to the empire, and of pro-
cuting the expected capture of fables for their own enrich-
ment. The firft voyage from the river Kovyma was under-
taken in 1646, by a free company of these Promyfceleni,
dercut of the countain a certain Iacut Ignatief, a native of
Mefu. They foumd the sea full of ice: between the ice,
howeover, and the main land, was an open passage, along
which they proceeded twice 24 hours; when, coming to
an iflet between the rocks and the shore, they ran into it.
These 48 hours make seven degrees and a half, and the bay
they entered lies in 72 deg. Here they met with people of
the Thukthikf nation, with whom they began to trade
in the manner customary with uncivilized people; spreading
their commodities on the shore, of which thne Thukthik
took what they pleased, and depofited in their place walrus-
tooth, and articles made of that species of ivory. None
of the mariners would venture on shore to the Thukthik,
particularly as they had nobody on board who could serve
as interpreter. Contenting themfelves, therefore, with hav-
ing made this firft discovery, they returned to the river Ko-
ym.

The accounts brought home by these people of the wal-
rus-teeth, induced fome other Promyfceleni fome years
afterwards to undertake a fcond voyage. To this end
Fedot Alexenf, a native of Kolmogor, affiliated him-
self with a Meico merchant of the Gollina forma, a fmall
of Alexey Ulof, and was immediately confidered as the
chief of the enterprife. He thought it, however, expedient
to ask of the commandant at Kovyma, one of his Kozaks,
to look after the concerns of the crown during the voyage,
who appointed one Simeon Ivanof in Dechef, to attend him,
with proper instructions. Four kettches, apecies of barks, failed at the fame time in June 1647, from
the river Kovyma. Some loofe information having been obtained
of a river Anad, or, as it was then pronounced, Anandir,
the borders of which were inhabited by numerous tribes
of strange people, it was calculated that this river must
fall into the Frozen ocean; one of the objects, therefore,
of the pr€sent voyage was to discover its mouth. How-
ever, in this as well as all the rest, it completely failed;
the sea, even in summer, being too fall of ice to permit
them a free navigation.

Nevertheless, the passion for discoveries for augmenting
the revenues of the crown, and the wealth of private in-
dividuals, was so great, that no thoughts were entertained
of giving them up. Indeed the number of adventurers
founded rather to increafe, both among the Kozaks and the
Promyfceleni, fo that the following year seven kettches
were fitted out in the fame design; what became of four
of these veffels the accounts received make no mention. Of
the three others, Simeon Dechef, and Gerard Ankudinof,
fome commanders on the part of the Kozaks, and Fedot
Alexenf, the principal of the Promyfceleni. Previous to
their departure, a quarrel broke out between the two for-
mers, arising from the jealousy of Dechef, that Ankudinof
should share in the honour as well as in the profits to accrue
from the future discoveries. The crew of each veffel
might confift of about thirty perfonns; at least that was the
number of Ankudinof's people.

It is to be lamented that the accounts of Dechef, the
original whereof Mr. Müller was lucky enough to find
among the archives of Yakutik, should lay fo little, and
even nothing at all concerning the fate of four of those
kettches: nothing of what happened to him and his com-
panions on board the other three till they came to the
Great Cape: nothing about the ice, however, doublef,
fays Mr. Müller, there was none; and, as Dechef remarks
in another place, the sea is not every year navigable.

The relation begins at this cape. His words are: "This
cape is entirely different from that which projects near
the river Thukthikh, wellward from the Kovyma. It is
fituate between the north and north-east, forming a femicircle
wards the Anadyr. On the Ruffians, or weftward flde, the
Thukthik are bafed by the fide of a river, a number of
walrusbones in the fform of a tower (according to other
reports they are the tulbs of the walrus). Oppofite to
the promontory (it is not mentioned on which flde) are two
iflands, whereon were fen people of the nation of Thuk-
thik, distinguished by wearing pieces of the teeth of the
walrus inserted in their upper lip. It is posfible, with
a very good wind, to ftrretch from the promontory as far
as the river Anadyr in three times 24 hours; and it
would require no longer time to do it by land, as the Anadyr
Dilcharges itself into a bay." On this promontory it was
that
that Anukidinof's kotch perished; the people, however, were saved, and put on board the other two kotches. Shortly afterwards these were separated, and never again got sight of each other. Dehnft, after being driven about by wind and weather till October, suffered shipwreck, as far as can be collected from circumstances, considerably to the south of the river Anadyr, somewhere about the river Ohtora. What became of Fedot Alexeief and his ship's company, we shall mention presently.

Dehnft, with his followers, five and twenty in number, now set out in search of the Anadyr, which they did not discover till after they had wandered about, for want of a guide, the tedious space of ten weeks. The region where they came up to the Anadyr was not far from its mouth, a country entirely void of inhabitants, and deficient of forests; circumstances that naturally threw them into the extremity of diftrefs, as perceiving no means of obtaining subsistence. Wild animals were not to be expected, as they usually haunt the woods; and they had no implements for filling. In this perplexity, twelve of the company went up the course of the river; but after a devions journey of twenty days, still finding no traces of mankind, they turned about to regain the station where Dehnft and the cell were waiting for them; which, however, on account of hunger and fatigue, only a few of them reached.

After undergoing incredible hardships, Dehnft, in the summer of 1649, with the small remains of his people, went up the Anadyr by water, till he came to a people, called Anaufl; and there he founded the Anadyrkoi-offtrog, which was followed by other buildings. Dehnft observed a great sand-bank lying at the mouth of the Anadyr, advancing on the northern side far into the sea, the rest of a vast number of morhles and other amphibious animals. This circumstance was too flattering to be neglected. Accordingly, he began to fell timber, in 1652, for the construction of a kotiche, to be employed in conveying the tribute to Yakutik by sea; but was obliged to delivef from his purpose, from the want of other materials, and because he learnt that the sea about Thukoktkoi-nofs was not every year equally free from ice.

In 1654, he made another expedition to the korga, or sand-bank, for the purpose of collecting morhle-teeth. He now associated with him a Kozak named Yulko Seliverstof, who had accompanied Mikhaila Sadokin on his voyage of discovery in the Frozen Ocean, and was sent from Yautik to collect these teeth for the benefit of the crown. In his instructions, mention is made of a river Stenvon, falling into the bay at Penhlink, as well as of the Anadyr; and he was ordered to levy a tribute on the inhabitants dwelling about these rivers; as what Dehnft had been doing was not as yet known at Yakutik. On this occasion new difcontents arose. Seliverstof arrogated to himself the discovery of the korga, as having failed to that place with Sadokin, in 1649. Dehnft however proved that he had not even reached the great Thukokthi-nofs, which he affirmed to be formed of nothing but bare rocks, as was but too well known to him, since Anukidinof's vessel had been wrecked upon them. He farther alleged, that this was by no means the first promontory that appeared under the appellation of Swetoi-nofs. The two islands lying opposite the Thukokthi-osts, belonging to the tooth-lipped people before mentioned, being the peculiar marks of it. That Dehnft alone, and neither Sadokin nor Seliverstof, had seen these people; and concluded by infaining that the korga at the mouth of the Anadyr was at a great distance from them.

Dehnft, while surveying the sea-coast, learnt of the Koraes the fate of the two Anukidinof's U-dot, and Gera-anim, as well as of Fedot Alexeief.

In 1659, other expiditions were again undertaken; but, from the foregoing impediments, though they set sail in July, they suffered so much damage from the floating ice between the eastern mouths of the Lena and Swetoimofs, that they were deterred from such voyages for a long time; and it was not till the reign of Peter the Great that these enterpries were resumed. It is well known that his comprehensive mind conceived only vast ideas and grand projects; that being principally defirous to establishe an extensive commerce by means of navigation, he began by opening to himself the navigation of the Baltic, by the foundation of St. Peterburg; Archangel already existed on the shore of the White Sea; he thought himself secure in the navigation of the Enzime, by the possession of Arc, and that of the Caspian by Astrakhan, which he succeeded in bringing to effect. He now conceived that it might not be impossible for him to participate in the lucrative commerce of the Indies, of Japan, of China, and of America, by establishing factories at the extremity of Asia, in the proximity of those countries. The Dutch East India company declining to attempt the discovery of the north-eaf paffage, the tsar adopted the project, as well as that of subjection the countries adjacent to the objects of his commerce, beginning by Kamaththa, of which some obscure information had been obtained.

Thither, in 1696, he sent Vladimir Atlassof, stationed as commandant of the Kozaks at Anadyrkoi-offtrog, a settlement that had been retained ever since its first erection by Dehnft, as before related, who was naturally supposed to have acquired an extensive knowledge of all the neighbouring countries. He accordingly dispatched sixteen Kozaks of Yakutik, to render the Kozaks on the river Opuka tributary; Morosco, their chief, acquired himself well of his commifion, and even took a Kamathadale offtrog. Atlassof, profiting by this advantage, put himself at the head of sixty Kozaks, and as many Yukuafs, and led them to the river Kamaththa, and the surrounding diilrits. In his juridical declaration, he relates, among other things, before he continues the recital of his progress to Kamaththa; that, between the Kovyma and Anadyr is a double cape, which some have called Shalaktooi cape and Anadyrkoi cape. Of the latter he affirms, that it can never be doubled in welfels of the ordinary construction, because on the western or northerf side are always vast pieces of floating ice (stationary and fold in winter) ; and that the other side of the sea of the Anadyrkoi cape is at all times free from ice. That, though he himself was not personally at the height of these capes, yet he learnt from the Thukothi, who dwelt about the mouth of the Anadyr, that over against this cape is a large island, inhabited by people who came to them in winter over the ice, and bring them bad fables.

To avoid profidity, we omit the remainder of his account; only observing, that Mr. Müller feems rather to depart from his usual candour, in regard to this narrative, which he acknowledges to be really Atlassof's; but fuggels that it does not exactly tally with a letter of his in 1700, nor with his juridical deposition in 1701. In order to have given validity to his doubts, he should have communicated these pieces among the great number with which he has enriched his valuable collection. This he has not done. And since the tsar, who was an excellent judge of mankind, was so well satisfied with him, that he made him colonel of the Kozaks at Yakutik, this circumstance ought to have its proper weight with us.

Parties were repeatedly sent against the Thukothi, with-
out being able to subdue them. In 1711, the Yakutsk-Kozak Peter Hinia Popof, the promyshlenok Yegor Vallilewin
in Toldin, and the newly baptized Ivan Vallilewin in Terlekh-
kin, made a vigorous attempt to compel those who dwelt on
the other side of the bay, and of the cape or nofs, to pay
the tribute; which they as strenuously refused. They, how-
ever, obtained from them a great number of particulars
concerning the situation of the surrounding countries; and,
among others, that opposite, whether to the Koyoma or
to the Amadyr they could not sufficiently comprehend, is situate
a spacious island, to which the Thukhti gave the name of
the great land, the inhabitants whereof pierce their cheeks,
and pass large pieces of teeth through the orifice; not
having the same language with the Thukhti, who have been
at war with them from time immemorial. Popof saw
ten of them, who were prisoners to the Thukhti; and he
remarked that these pieces were those of the walrus. He
learnt that in summer they pass over to this island in baidars
in one day, and in winter likewise in one day in fedges on
the ice.

On the promontory or land of this cape no other an-
timals than wolves and foxes are seen, since there are no fel-
larks; whereas on the other land are all sorts of animals that
figure the finer sorts of furs. The inhabitants keep numer-
rous herds of rein-deer. The country produces cedar, fir,
pine, larches, and other trees. Popof supposed that the
number of the Thukhti at this cape might amount to two
thousand men, and that of the illiders to triple that sum.
That, from the Amadyr to the far off they go by land to the
nofs, along the rock Matkol, which runs out from a great
gulf.

At the time of which we are speaking, there being yet
no implements for navigation at Okhotik, and the use of the
camps not being known there till the year 1714, by the
express command of the great czar Peter I., the governor
Prince Gagarin supplied both these defects. Probably the
governor at first imagined that the purposes of discovery might
be effected without these helps; for the first order
relating to the discovery of a passage by sea to Kamchatka,
dated the 17th of February 1713, directed to the voevode
Yelthin, contains not a word about the construction of ves-
sels, nor of people expert in the art of navigation; accord-
ingly, nothing farther appears than that the dvoramin Ivan
Vallilewin, who was charged with the business at Yakutik,
after arriving with twelve kozaks at Okhotik in the autumn
of that year, committed a great many blunders, and was
brought back to Yakutik in custody. It was now found
necessary that the governor should immediately send some
able men and ship-carpenters. By these, who arrived at
Yakutik the 23d of May 1714, and were sent off to Ok-
hotik the 3d of July, under the command of a Kozak named
Kalim Sokolof, with about twenty Kozaks, the long-wihled
for discovery was made.

One of the sailors, by birth a Dutchman, a native of Hoorn,
(Strahlenberg calls him Swedish corporal, who had formerly
been a ship-carpenter; but Buhf himself says, that he had
served in various places many years as a sailor, and at last in the
Swedish cavalry, and so came to be taken prisoner at Vyborg,
in the year 1706), named Henry Buhf, was still living at
Yakutik in 1736, when Mr. Miller made some stay there;
and, in answer to his inquiries, he learnt of him the following
particulars. After they were come to Okhotik, the car-
penters built a vessel of the same kind with the Russian
lodges, in which they used formerly to go from Archangel
to Mefen, Polozero, and Nova Zemlia. These labours oc-
cupied the whole of the year 1715. The vessel was very
short and substantially. It was eight fathoms and a half in
length, and in breadth three fathoms. When loaded, it drew
three feet and a half of water. All things necessary for the
voyage being ready, the first expedition was undertaken in
June 1716. They coasted northwaftwards, as far as the
region of the river Oka. It was intended to pursue the
same course farther; but a contrary wind drove the vessel,
as it were against the will of the navigators, across the
sea to Kamchatka. What they first desired, as they after-
wards were informed, was a promontory, starting northwards
from the mouth of the river Tigil. The coast formed steep
and rocky, therefore they would not venture on those dis-
tances as they were of any pilot or guide. Proceeding, how-
ever, to keep the sea, a contrary wind arose, which drove
the vessel back upon the Okhotikian shore. The wind after-
wards coming favourable, the navigators tacked about, and
came exactly back to the Tigil, where they now cast anchor.
Some of the people went on shore in search of human beings,
but found only empty huts. The Kamthaadles had per-
ceived the veild approaching, and had fled for fear into
the forests and mountains. Our mariners therefore again set sail,
passed the Tigil, and in the space of a day reached the
stream Chirulofoza, having two small islands lying in its vi-
cinity. The former, being the largest, is at the distance of
five versts from the main land; the other, consisting only of
bare rocks, a little farther. Leaving the Chirulofoza,
they found out to sea the whole night, and the next morn-
ing found themselves in with the land at the river Ithina.
Here they sent some of the crew on shore, who, finding
however neither people nor habitations, presently returned.
Continuing to sail along the coast, they came up with the
river Krotigorovka, into which they would have run, but
missed the inlet; luckily, however, a bay opening to the
south of the river being found convenient, in it they dropped
their anchor. A detachment of them, while exploring the
country, met with a Kamthaadle girl picking up eel-like
roots in the fields. She directed them to some huts, where,
just at that time a party of Kozaks had put up for the
purpose of collecting the tribute. These, on being sent to,
came and served them as guides and interpreters. The vessel
was brought to the mouth of the river Kompakova, which
they found a good birth to moor in, for the winter. Here
they had not been many days when a whale was thrown shore
by the sea; in the body of the fish was sticking a harpoon of European manufacture, marked with Roman
letters. If I could have furnished, continues Mr. Miller,
that the deliver who related to me this fact, had known of
the like accident that happened to the shipwrecked Dutch-
men on the coast of Korea, in 1673. (Wilken, ed. 2. p. 15.
"Voyage au Nord," tom. ii. p. 308.) I might have been led
to suspect, that he perhaps was amusing me with a tale that
had no other foundation than what he borrowed from the
former. This, however, was not the case. For he was a
completely illiterate man, could neither read nor write, and
clearly knew that there was such a place as Korea in the
world; consequently the fact is only the more confirmed by
two examples. The commander Sokolof, during the win-
ter, made a journey to Nishimi Kamthathkoi offtrog, whence
he returned to the ship in spring, and at the beginning of
May 1717, put again to sea. The sea, however, was so
full of ice, that on the fourth day from their departure they
were completely jammed in between some fields of it, where
they were obliged to remain fixed upwards of six weeks,
before they could proceed on the voyage. At the same
time they were in great want of provisones. Happily they
regained the Okhotikian shore, between the river Ola and
Tunilokioftriog, where they remained at anchor a few days;
and about the middle of July returned to Okhotik. From
this
this time a navigation has been uninterruptedly kept up between Okhotik and Kamtchatka.

While all this was transacting, governor prince Gagarin, in the year 1716, dispatched colonel Jacob Ageef in Yelthbin, formerly voivode at Yakutsk, with a considerable party of officers and people, to the same region, with orders to make diligent inquiries concerning Kamtchatka, and chiefly such as related to the object in question. Kofrefsky mentions, that ships from Japan came to the sixth of the Kurilli islands, Shokoki, for ores or minerals, which they carried back to their island. This, however, seems to be not quite correct, as differing widely from all the other accounts, which say, that the Japanese (probably when driven about by adverse winds and storms) used never to proceed farther than Matamai. Nor had any subsequent information confirmed what he advances. This therefore was one of the principal matters into which the colonel was instructed by the governor to inquire; he was likewise to proceed from Thukotikoi-nofs to the opposite islands, and thence to the main land. By his instructions also he was to gain accurate information about the islands of Saintary; to attempt to settle a regular traffic with the Japanese, and whatever else he could effect in consequence of his own observations; noting, however, of importance ensued from it. The governor had given the colonel, a Swedish lieutenant named Amborn Maly, who was to construct the vessels proper for the several enterprises at Okhotik. This man pretended that there was no timber to be found at that place fit for the purpose. (Seevol Strahlenberg, p. 17.)

Disputes arose now between the colonel and the voivode of Yakutsk, Ivan Vafilhef Rakinin, which likewise probably threw great impediments in the way of this expedition; and the disgrace of prince Gagarin happening soon after, the whole business came to nothing. The only benefit accruing from it was a voyage on foot by Yelthtin, in the year 1718, to the Shantar islands, and performed by the in bayarikoi Prokofey Philkief. This person was still living when Mr. Miller was at Yakutsk, and from whom he learnt the following particulars of his voyage.

Philkief was provided with able ferns, the better to enable himself, when they were out at sea, these men declared to him, that they were resolved to visit not only the Shantary, but all the other islands lying in those seas, as far as the Kurilli; which done, they would winter on the largest of the Shantar islands, which by way of eminence is denominated Shantar. This not being agreeable to Philkief, he caused himself, with a couple of Kozaks, to be put on shore at the mouth of the river Tugur. The rest accomplished their design, passed the winter on the isle of Shantar, and had a rich capture of fables. Having negligently, however, left a fire they had been using, the flames caught the trees, so that the whole forest of the island was in a blaze, by which they also lost their fables. The next summer they returned to the continent, where, intending to fish along the coast between the Tugur and the Amoor, the greater part of them were slain by the Giliaks. They computed the isle of Shantar to be from south to north about twenty versts, and three or four versts in breadth, without any mountain upon it. Now then were these islands to be seen from the mouth of the river U? This therefore seems to confirm Philkief's assertion, that they are situate in the proximity of the Tugur, and that it requires eight days to pass from the U to the Tugur, in lodkas or small craft. If we admit the situation of the coasts to be as they appear upon the maps, namely, as stretching directly south from Okhotik to the Amoor, then the difficulty is much increased; because in that case there must be several promontories projecting so far as to conceal these islands from the view. But various reasons may be found for believing that the coast from Okhotik to the river Ud runs south-westerly, and from the Ud to the Amoor south-easterly. If it is, as it is highly probable it will hereafter be found, that the Shantar islands may lie in such a manner as to follow one another in succession northwards from the river Tugur. There may be more of them than we imagine, since the number of them is by no means ascertained. In that case, the narrative may unquestionably be diversed from the river Ud.

In 1718, a tribe of Thukthiis came voluntarily to surrender themselves at the Anadikoi oftrog, declaring that they inhabited the promontory between the Andyr and the Kowynia; that they were in number about 3500 men; that this promontory was covered with rocks and mountains, but that the flat country consisted of curialand; that opposite to the cape was seen an isle of moderate dimensions, the inhabitants whereof bore a resemblance to the Thukthiis, but spoke a different language; that from the point they could go over to the isle in half a day; that beyond it was a large continent, which might be seen from the island in fair weather; that its inhabitants likewise resembled the Thukthiis, had a different dialect, numerous forests, &c., (giving an exact description of the great island mentioned above); that with their baidara, or boats, by coasting the promontory, they could make the voyage from the bottom of the bay of Andyr, to the extreme point of the promontory, in three weeks, and often in lost time.

Peter the Great, desirous of obtaining a more accurate knowledge of these parts and passages; and, unable to induce the Dutch East India Company to take up the matter, resolved himself to prosecute the design with vigour. Accordingly, in 1727, he sent two good ships, or geometors, to Kamtchatka. Of what they executed or discovered, nothing ever came to the ears of the public. It is only known, that on their return, the war gave them a very gracious reception; whence it may be presumed, that they acquitted themselves of their trust to his satisfaction.

In short, the war being resolved to satisfy his curiosity, by casting these latitudes to be explored, and, above all, to be certified whether Asia was contiguous to America on the north-eastern side, towards Thukthiis-nofs, since on the north side it undoubtedly was not; he made choice of Vitus Bering, an expert Danish mariner, for that purpose, to whom he joined lieutenants Spangberg and Thirikof. Peter had this business so much at heart, that, though confined to his bed by the disaise that put an end to his life, he converted with Bering, and even drew up with his own hand a set of instructions for his guidance, which paper was delivered to him five days after the demise of that great monarch.

He set sail the 14th of July 1728, from the river of Kamtchatka, and Reeder north-easterly, following the land as seldom to lose sight of it. Of this he drew a chart, so accurate as to be held the best extant.

The 8th of August, being in lat. 61° 52' 5 a halfe, having eight men on board, came up to his vessel. These proved to be Thukthiis, who told him that the coast was covered with the dwellings of their people, and gave him to understand, that not far off the land trended towards the west; they also pointed out an isle at no great distance, which Bering came up with on the 10th of August, and gave it the name of Saint Lawrence.

On the 15th of the same month, in 67° 18', lat. perceiving that, as the Thukthiis had said, the coast bent towards the west, and no longer to the north, it is said that he drew this
had taken the westward direction; it was impossible there could be a junction of Asia with America; and that he had fulfilled his commission. Mr. Müller adds, that he was mistaken, since he was only then at Serdzekamn, whence the coast indeed turns to the west, forming a large gulf; but that it afterwards returns to the north and north-east, as far as the great T'punkthii-sofs. On his passage back, the 20th of August, forty T'punkthii approached his ship in four baidars, and informed him, that their countrymen frequently went to the Koyyma by land, with merchandise, but never by water.

Afanasy Shellakof, colonel of the Yakuttoki Kozaks, having made several proposals to the senate, to render the obdurate T'punkthii tributary, it will be necessary to lay something of his expedition, as being of some consequence to the history of navigation. Shellakof was resolved to reduce not only the T'punkthii, but likewise the Koriaks, who dwell on the Siberian coast of the Penhinskian sea, and likewise inhabit both shores of the northern part of Kamtchatka, and were frequently in a state of rebellion, to obedience. He purposed to visit the country lying opposite to T'punkthii-sofs, and subject the inhabitants to the Russian authority. It was part of his plan likewise to make an attempt to discover the pretended land in the Frozen ocean; and, lastly, before his return, to explore the Shantarain and Kurilly islands. The obduracy, with which he accompanied the delivery of his project, gained him universal approbation, and high and low became interested in the success of his enterprise, all conceiving it extremely probable that great public benefit might accrue from it. Accordingly he was appointed commander of a particular expedition. The admiralty of St. Peterburg gave him a pilot, named Jacob Hens, with an affiant, Ivan Fedorof, a geodesist, Michael Gvozdof, a mineralogist, named Herdolai, and ten sailors. At Ekatarnenbourg, he was supplied with field-pieces and mortars, with all proper appurtenances. At Tobol'sk, a captain of the Siberian regiment of dragons, Dmitri Pavluzki, was ordered to join him, with four hundred Kozaks, under his united command; and they were farther empowered to increase their strength from all the garrisons, forts, and sloop, in the territory of Yakutk, wherever they should come, at their discretion.

These preparatives being made, Shellakof set out from St. Peterburg for Siberia in the month of June 1727. At Tobol'sk he arrived till the 28th of November, paused the winter in the upper regions of the Lena, and reached Yakutk in the summer of 1728. Here a violent quarrel arose between Shellakof and Pavluzki, which probably occasioned them to part, though they prosecuted their several purposes to the same end. Shellakof, in 1729, repaired to Okhotk, and there took to his use the vessels with which captain Beering had lately returned from Kamtchatka. Having dispatched his shipman, the lie boyarikoi Ivan Shellakof, on the 2nd of September, in one of them, the Gabriel, to go to the river Ud and thence to Kamtchatka, for the purpose of examining and describing all the isalnds he might meet with on that voyage; he sailed in the other vessel, the Fortuna, for Tavikoi oifrog, but had the misfortune to suffer shipwreck, and to lose the greater part of his people perishing in the bilows, with great difficulty saving himself and four other persons from sharing their fate. The 30th of September, he sent from Tavikoi oifrog a kozak, Ivan Olta- sief, in company with an elder of the Koriaks, forwards along the coast, with orders to proceed to the river Penhina, and, by kind words and fair promises, to persuade the refractory Koriaks dwelling in that tract, to submit to the Russian government. He himself followed, at the commencement of December, with the rest of his men, took up Oifrog by the way, and arrived within two days journey from the Penhina, where he fell in with a prodigious host of T'punkthii on their march to make war upon the Koriaks. Though the number of Shellakof's followers, Russians, Okhotkian Tungufes, L/>.arutes and Koriaks, all together conficted of not more than 150 men, yet he did not hesitate to rile a battle with the T'punkthi. This, however, had an unfortunate issue; Shellakof was struck by an arrow from the enemy, which deprived him of life, and those who escaped falling with him, were entirely put to flight. This happened the 14th of March 1730, near the island Ye-gath, which falls into the Penhinskian gulf between the rivers Paren and Penhina.

Three days prior to this disastrous event, Shellakof had sent an order to Tavikoi oifrog, directing the Kozak, Trypho Krupjhef, to proceed in one of the vessels to Bol'hotzoi oifrog, from thence doubling the southern point of Kamtchatka, to fail on towards Nihoi Kambathkoi oifrog, to continue his voyage in the same ship to the river Anadyr, and invite the inhabitants of the vast tract of country lying opposite, to pay tribute to Russia. In this dispatch he recommended Krupjhef to take with him the geodesist, Gvozdof, in cafe he were inclined to go, and to treat him with all possible kindness. Concerning what came of it, no accounts are extant. Only thus much is known, observes Mr. Müller, that the geodesist, Gvozdof, was actually, in the year 1730, between the 65th and 66th degrees of latitude, at a short distance from the country of the T'punkthii, on an unknown shore, situate over against the said country; that he even found people there, with whom, however, he was unable to converse for want of an interpreter.

During these transactions, the five boyarikoi Ivan Sheltakof, was calling on board the Gabriel to Kamtchatka, and, on the 19th of September 1729, arrived at Bol'hotzoi oifrog. For, though his instructions were to proceed north to the river Ud, he was prevented from doing so by violent adverse storms. The following summer, however, he made the voyage to the Ud, touched at Udiskoi oifrog, where he found people who had been sent thither by colonel Shellakof, and had built a vessel; but that not being fit for his purpose, he returned to Kamtchatka, having been both on his passage forwards, and on his way back, several islands, and at last made again the port of Okhotk.

While Shellakof was on his passage back to Okhotk, Jacob Hens, the pilot, received a dispatch from captain Pavluzki, who had come directly from Yakutk, by the common inland road, to Nifnei Koyymski Simov, or oifrog, informing him that he had heard, by way of Anadyri oifrog, of the death of the Kozak, colonel Shellakof; but that this would cause no impediment to the progress of the expedition: at the same time ordering the pilot Hens to go, with one of the vessels which captain Beering had left at Okhotk, round by Kamtchatka to Anadyr, whither likewise captain Pavluzki would proceed without delay. In pursuance of this order, Hens went on board the Gabriel, and failed for Kamtchatka. On the 20th of July 1734, he arrived at the mouth of the river Kamtchatka, intending, to purdue his voyage to the Anadyr, when a report was brought to him, that the same day a rebellious crew of Kamtchadales were come to Nifnei Kamtchatkoi oifrog, where, after murdering most of the Russians, they had set fire to the dwelling of the inhabitants. The few remaining Russians took refuge on board the vessel, and Hens sent a party of his people on shore to reduce the Kamtchadales
to obedience; in which they succumbed; but the event actually stopped the navigation of the river Anadyr.

In the mean time, captain Pavlovsky had arrived, the 3rd of September 1738 at Anadyrkoi offort. From that place, in the enforcing summer, he marched on an expedition against the refractory Thukhthi. Pavlovsky opened his campaign the 12th of March 1731, his force consisting of 245 Russians, 160 Koriaks, and 60 Yakagirs. He took the road across the sources of the rivers Ubera, Bela, and Ticherna, which fall into the Anadyr, advancing directly north towards the Frozen ocean, and leaving the head of the Anadyr to the left. Of the other rivers which he crossed, nothing is known, as there was nobody to inform him of them, or tell their names. After a course of two months, in which they could not proceed above ten versts a day, and that only by retreating at times, Pavlovsky came to the Frozen ocean, at a place where a considerable river d先行mogues into it, but the name of which he could not learn. He now proceeded fourteen days eastward along the coast, molly over the ice, without observing any mouths of rivers, as they were oftentimes obliged to keep out on the ice at a distance from land. At length they perceived a great troop of Thukthi advancing towards them, apparently intending to come to an engagement with them. Pavlovsky, by an interpreter, summoned them to surrender to Russia; which, on their peremptorily refusing to obey, he immediately attacked them, and had the good fortune to give them a total defeat. This happened on the 7th of June.

After retreating one week, Pavlovsky continued his march, and at the latter end of June came to two rivers that discharge themselves into the Frozen ocean, at the distance of a day's journey asunder. On the bank of the latter of these rivers, on the 30th of June, a second battle was fought, which terminated as happily as the former. They now lay still for three days, then proceeded to Thukotikons, resolving to go right across it to the Anadyrkian sea, when a third time they law advancing towards them a numerous army of Thukhti, collected together from both coasts. Here on the fourteenth of July was fought the third battle, in which the slaughter on the enemy's side was greater than the advantage on that of the Russians; as, notwithstanding their defeat, the Thukthi would hearken to no terms of submission or truce. Among the spoil were found many articles that had belonged to the Kokax, colonel Shellakof, and were lost in the engagement that happened near the island Yegath. That affair therefore was thus amply revenged; especially as in all the three battles, not more than three Russians, one Yukagir, and five Koriaks, were left on the field. It was affirmed, that among the killed of the enemy in the last encounter, one was found who had a hole in the upper lip on each side of the mouth, in which pieces of the walrus tooth were inserted.

Pavlovsky now marched triumphantly across Thukotikons, in which he had to climb over the summits of huge mountains, and at the end of ten days happily reached the other coast. Here he sent off some of his people by water in baidars; but remained himself with the greater part of his followers on shore, and kept along the coast, which there stretches south-eastward, so that every evening he received reports from the baidars. On the seventh day they came up to the mouth of a river, and twelve days after, to that of another, from which, at the distance of about ten versts, a point of land runs far out into the sea, which at first is mountainous, but terminates in a plain extending as far as the eye can see. This point is probably the same that obliged captain Beering to put back. One of the mountains is by the inhabitants of Anadyrkoi-orlorg called Serdzekamenn.

Pavlovsky hence turned in land, and returned to Anadyrsk the twenty-third of October, by the same way that he went out.

Mr. Miller speaks of the ardent zeal which M. Kerilof, at that time secretary of the state, manifested for the success of these discoveries in 1732.

Having related what information has been obtained from the Russians, and particularly from the indefatigable Mr. Miller, we shall now proceed to deliver, as briefly as possible, what we gather from other authors, more ancient.

Pere Avril was informed by a voyage, that the people dwelling about the Kovyma frequently went to the shores of the Frozen ocean to pursue the morse, for the sake of their teeth. M. Witien, justly celebrated for his persevering diligence, from about 1670 to 1692, in the discovery of these unknown countries, says, that "the great projecting point, which he calls Cape Tabin, extends near to America; that about fifty or threecour men, coming from the Lena, a little before 1692, put out to sea in the Frozen ocean; and, having turned to the right, came to the point against which the fields of ice driving from the north strike with their whole force, &c. It was therefore not possible for them to double this cape, nor to perceive its extremity from the mountains of the north-east of that point of Asia which is not extremely wide in that place; they remarked that the sea was free from ice on the other side, that is, the southern, whence it may be inferred that the land of that point extends so far to the north-east, that the floating ice, coming down from the north, cannot pass on the southern side."

Mr. Buache, from whom this passage is taken (Consider. Geograph. p. 105, 106.) corroborates and illustrates the account thus: "The first pieces of ice (he says) coming from the north, float at the island between the cape and America, and on the shallows which connect it to the two continents; these large flakes, accumulating on one another, form a sort of bridge; and it is only then, that the others which afterwards come down from the north, are unable to pass to the south, &c. On this point (continues M. Witien) are found men who wear little fomes and pieces of bone inserted in their cheeks, and seem to have a strong affinity with the North Americans."

Kempfer, in 1683, sparing no pains that might any way lead to the knowledge of the northern regions, was informed by several persons, that the Greater Tartary was joined by an illusus, composed of lofty mountains, to a neighbouring continent, which they supposed to be America. He was shown the first maps of the Russian empire, laid down some years before, without degrees of longitude. On them appeared several considerable capes on the eastern shores of Siberia; one of them, too large for being comprised within the border of the map, which was cut in wood, was abruptly shortened by it. This is the point spoken of by M. Witien; but at that time, it is said to have been thought more near to Ruffia than it really is.

Ibrahim Ides, from informations carefully taken in 1693 and 1694, speaks of Kamthkatka, as of a town, which, with the surrounding country, was inhabited by the Xusi and Karliki ('Thukhti and Koriaks); says, that the cape of ice is a tongue of land projecting into the sea, where it is intersected by several arms of water, which form gulls and islands above Kamthkatka; the sea has an entrance frequented by the fishermen; here are the towns Anadyrkoi and Sabatfia (on the map, and according to others Sabatha), inhabited by the two nations above mentioned. The inhabitants of Yakutik go to cape St. Sabatha, Anadyr, Kamthkatka, &c. in quest of the narval.

The Swedish officer, who was a prisoner in Siberia from
1709 to 1721, contending against the opinion of those who imagined that Asia was contiguous to America, positively affirms that the Russian vessels, coasting along the main land, ordinaril}y pass the Svertoi-nois, in order to trade with the Kamthathakias on the shore of the Eastero ocean, about the fifteenth degree of latitude: but for this purpose they are obliged to pass between the main land, and a great island lying to the north-out of Svertoi-nois, and that this is the north-west of America. Strahlenberg mentions nothing farther in his work than the facts already related, excepting that the Yakagirs are a people settled near the Frozen ocean, between the mouth of the Lena and Cape Tabin. It has been found, that in the part of the continent of America of which some knowledge has been obtained, opposite the cape, there is a large river, wafting down its current numbers of great trees, &c.

From all these, and various other documents and data, M. Engel endeavours to establish some important facts; such as, that the position of this pretended cape Tabin owes its origin to the direc of fixing that of Thiny spoken of above; and this motive having sufficed till within a few years past, or at latest, the idea of a finite term towards the north-east, it has been preferred, and some cape or other was to be found for this purpose. That the largest of all, that which extends farthest into the sea, and the most formidable, according to all accounts, is the double cape, called Serdtszakamen, or heart of stone, north of the Anadyr, which may in many years, at least, without difficulty be doubled; since it is not owing to its proximity to the pole, but to the occasional conjunction of vast bodies of ice, that renders it at such times impracticable.

M. Gmelin says: "There are even traces of a man who in a small boat, not much bigger than a fisherman's canoe, doubled the Shalaginsky cape, and made the voyage from the Kovyma to Kamthatha." It may be added, adds M. Engel, whether I am so credulous as to believe it? No: if I should grant what he means by that cape; since this man must have failed, according to the absurdities laid down in the chart, five or six hundred leagues. But if according to my system, we banish Cape Tabin into its proper nonentity, diminish the extent of the coasts, approximate the rivers, especially the Kovyma (for the supposed declination of the earth, and the greater proximity of the Fedirka and the Kovyma, are confirmed by various arguments); by doubling the Serdtszakamen, as the sole and real cape Shalaginsky, then it would be by no means impossible, in one of those years, when, as M. Muller allows, there are no mists of ice in its environs.

The authorities wherein M. Muller and the Russian geographers fix the longitude of the easterly extremity of Asia beyond the two hundredth degree from the first meridian of Ferro, or 180° 6' 15" from Paris, are derived from the observations of Jupiter's satellites, taken by Krafmlnikof, at Kamthatha and in several parts of Siberia; also from the expeditions, both by land and sea, of the Russians towards Thukotikoi-nois.

M. Engel disputes the accuracy of these observations, and deduces no less than twenty-nine degrees from the longitude of Kamthatha as stated by the Russians. M. de Vaugondy, however, fees no sufficient reasons for so extraordinary a subtraction; and contents himself with curtailing the continent of Asia of no more than eleven degrees of longitude. M. Bache differs from the opinions both of Engel and Vaugondy; defending the system of the Russian geographers on the authority of tables drawn up by M. Maraldi. It is certain that Krafmlnikof compared his stations with correspondent observations made at Petersburg, and the results were; on comparing an observation of an eclipse of the first satellite of Jupiter, taken at Okhotsk, Jan. 17, 1743; with an observation of an eclipse of the same satellite taken at Petersburg, Jan. 15, of the same year, the difference of longitude between Petersburg and Okhotsk appeared to be 7 hours, 13 minutes, 29 seconds; from a comparison of two follow not similar observations, the difference of longitude was found to be 7 hours, 31 minutes, 32 seconds; the proportional mean whereof, rejecting the half second, is 6 hours, 31 minutes, 34 seconds, the true difference between the meridians of Petersburg and Okhotsk according to these observations. Adding the longitudinal difference between Petersburg and Paris, which is 1 hour, 52 minutes, 25 seconds, we get the longitude of Okhotsk from Paris, 7 hours, 23 minutes, 56 seconds, differing only 26 seconds from the result of M. Maraldi. (See Nov. Comm. Petropol. tom. iii. p. 472.) So likewise the longitude of Bolsherkfti, from correspondent observations taken there and at St. Petersburg, appears to be 10 hours, 20 minutes, 22 seconds, differing from Maraldi about 2 minutes, 5 seconds. (1d. lib. p. 409.)

But the longitude of the haven of Peterpavlovsk, calculated in like manner by correspondent observations, disagrees with the longitude as computed by Maraldi, no more than 20 seconds. (Ibid.) Besides, the results deduced from correspondent observations of the eclipses of Jupiter's satellites taken at Bolsherkfti, and at the haven of Peter and Paul, by Krafmlnikof, and at Pekin by the Jesuit missionaries, evince by their near agreement the care and attention with which the observations must have been conducted; whereas there is great reason to suppose, that the suspicions of inaccuracy imputed to Krafmlnikof are delusive of any just foundation. (Oblerv. Altron. cal. Sat. Jovis, &c. Nov. Comm. Petrop. tom. iii. p. 452, &c. Oblerv. Altron. Pequini factae. Ant. Hallerlein. Curante Max. Hell. Vindibone, 1768.)

For supporting, however, in some fort, these suspicions, H. Vaugondy pretends, that the time-pieces and other instruments used by Krafmlnikof at Kamthatha, were greatly damaged by the length of the journey; and that the person who was sent to repair them was not expert in his business. But this opinion seems to have been too hastily adopted; for, though Krafmlnikof does indeed allow that his time-piece sometimes toppot, and that too, when he wanted to ascertain the true time of the observation; and farther admits, that consequently the observations taken by him under these disadvantages, when he was unable to correct them by former or subsequent observations of the sun or stars, are not to be relied on, and which he has therefore disdained by an alfarism; there are nevertheless many others not liable to any objections of this nature; and the observations alluded to above fall under this description. (See Nov. Comment. Petrop. tom. iii. p. 444.) However, the testimony of the late professor Muller, who was in those parts with Krafmlnikof, as to the sufficiency of the instruments, entirely removes that objection.

The best way of trying the accuracy of the Russian geographers in setting the longitude of Kamthatha, will be by comparing it with that of Yakutsk, which has been clearly established by a variety of observations taken at different times and by different persons. If therefore any error be in placing Kamthatha too far to the east, it is in the longitude between Yakutsk and Bolsherkfti.

Now, Krafmlnikof, on his return from Kamthatha, observed at Yakutsk several eclipses of Jupiter's satellites, from which it appears, on comparing them with calculations of the same eclipses made by M. Wargentin for the meridian of Paris, that the mean of the result is 8 hours, 29 minutes, 5 seconds. The observations of M. Isenief, taken at Yakutsk, &c.
kutik in 1769, whether he had been sent to observe the transit of Venus, received the function of the imperial academy of sciences. (Nov. Comment. Acad. Petrop. tom. xiv. pars iii. p. 268—321.) The longitude given by him to Yakutik is eight hours, 29 minutes, 34 seconds, a sufficiently accurate agreement with the longitude resulting from the observations of Krafftikof.

The longitude therefore of Yakutik from Paris being 8 hours, 29 minutes, 34 seconds, or 127° 16' 57"; and of Bolshertek 10 hours, 17 minutes, 17 seconds, or 150° 19' 15", the longitudinal difference of these two places, from astronomical observations, is 1 hour, 44 minutes, 42 seconds, or 27° 3' 6". The latitude of Bolshertek is 52° 55' 3", and that of Yakutik 62° 1' 50"; then the difference of their longitude being from the foregoing statement 27° 3' 6", the direct distance between the places appears on a great circle of the earth will appear by trigonometry to be 16° 57', or about 1773 versts, reckoning 104½ versts to a degree. This distance consists partly of sea and partly of land; and a constant intercurve is kept up between the two places, by means of Okhotik, which stands in the intermediate space. The distance by sea from Bolshertek to Okhotik is estimated by nautical reckonings to be 1254 versts, and the distance by land from Okhotik to Yakutik is 927, making together 2181 versts. The direct distance deduced by trigonometry, supposing the difference of longitude between Bolshertek and Yakutik to be 27° 3', is 1773, falling short of 2181 by 408; a difference naturally to be expected, on considering that neither journals by land, nor voyages by sea, are ever performed precisely on a great circle of the globe, which is the shortest line between any two places.

Such being the agreement between the distance thus estimated, and that deduced by calculation, admitting the difference of longitude between Yakutik and Bolshertek; to be 27° 3', it seems highly improbable that there should be an error of many degrees in the astronomical determination.

Since then the longitude between Ferro and St. Peterburg is conveniently 48°; that between St. Peterburg and Yakutik 99° 21'; and, as the distance in longitude between Yakutik and Bolshertek cannot be materially less than 27° 3'; it follows, that the longitude of Bolshertek from Ferro cannot be much short of 174° 23. How then are we to find room for so considerable an error as 29 degrees, which, according to M. Engel, on whom 200th degrees, according to M. Vaugondy, is chargeable on the Russian geographers in determining the longitude of Kamtchatka?

From the isle of Ferro the longitude of Yakutik is

As no astronomical observations have been made farther to the east than the haven of Peter and Paul, it is impossible to ascertain with precision the longitude of the north-eastern promontory of Asia. It is nevertheless apparent, from Beering's and Synd's coasting voyages towards Thukhtikofes, as well as from other expeditions to those parts by land and sea, that the coast of Asia, in lat. 64°, stretches at least 23° 2' 30" from Por. Peter and Paul, or to about 200° longitude from the line of Ferro. But the accuracy of Krafftikof's observations at the harbour of Peter and Paul has since been confirmed by captain Cook, who places that harbour in lat. 53° 1' 10", long. 152° 55', east from Greenwich; Krafftikof stating it to lie in lat. 53° 6' 38", long. 176° 10'; from Ferro, or 158° 35' from Greenwich. The difference therefore is only twenty-two seconds in the latitude, and one minute in the longitude. Consequently, the assertion of Vaugondy, that the Russians had advanced the peninsula of Kamtchatka eleven degrees too much to the east; and of Engel, who supposes that error to be no less than twenty-nine degrees, is manifestly refuted; and the accuracy of the astronomical observations made by the Russian geographers is now incontestably ascertained.

The next point of land observed by our English navigators, was that promontory, by Beering called Thukhtikofeso, a name adopted by captain Cook, but which is sometimes denominated Anadyrso, from its situation on the bay of the river Anadyr. The application of the term Thukhtikofeso to this promontory, may perhaps occasion some confusion to future navigators and geographers, as that denomination has been usually given, and ought therefore to be appropriated to the eastern extremity of Asia, the east cape of Cook.

From Anadyrfo to, laid down by the English in lat. 64° 13', under the appellation of Thukhtikofeso, to cape Serdrekamen, in lat. 67°, the utmost extent of Beering's navigation to the north, captain Cook does justice to the memory of Beering, by observing, that "he has here delineated the coast very well, and fixed the latitude and longitude of the places better than could be expected from the methods he had to go by." (Cook's Voyage, vol. ii. p. 474.)

Within this track our great navigator has corrected the errors of the Russian charts, and ascertained the position of the real Thukhtkofeso, which Müller had erroneously conjectured to lie above the 70th degree of latitude. He gives the name of East-cap to this great extramity of Asia, and fixes its latitude in 66°, and longitude 190° 22; incontestably shewing, that the Russians were not wrong in alleging that the north-eastern extremity of Asia stretched beyond the 200th degree of longitude from the isle of Ferro, or 182° from Greenwich.

That remarkable expedition of Defnhef, in which, according to professor Müller, he failed from the mouth of the Kouryna, weathered Thukhtikofeso, or East-cap, and was shipwrecked in the sea of Kamtchats, was not only the earliest, but the most important of the Russian enterprises in these latitudes, as it first ascertained the separation of the two continents.

Defnhef's description of the north-eastern cape agrees in several material circumstances with that of the former promontory given by captain Cook. According to Defnhef, it "contains entirely of rocks." Cook says, that "it presents a steep rocky cliff, next the sea; and at the very point are some rocks like spires. The land about this promontory is composed of hills and valleys; the former terminate at the sea in steep rocky points, and the latter in low shores. The hills seem to be naked rock." (Voyage, vol. ii. p. 472.)

Defnhef adds, that, on the coast near the promontory, the natives had reared a pile resembling a tower, with the bones of whales." Cook likewise noticed these piles as very common on the coast of the Thukhtk. "Over the dwelling stands a kind of Sentry-box, composed of the large bones of large fish;" and again, "near the dwellings were erected flagged huts, such as before described." (ib. p. 451-472.) Cook also coincides with Defnhef in placing two islands directly opposite to the promontory; and captain King confirms another assertion of the Russian navigator, that the passage from the same promontory to the mouth of the Anadyr, may with a fair wind be performed in twenty-two hours. (I. vol. iii. p. 264.)
It has been objected to Defnecf's narrative, that Cook and Clerke were, in two successive years, prevented by the ice from pushing forward into the Frozen ocean; but in reply to this, it should be observed, that Defnecf failed in a small vessel, more easily worked than the English ships; and that the year in which he passed round is represented as more than usually free from ice. The reason also in which Defnecf doubled the great Siberian promontory, probably was more favourable to navigation in the Frozen sea, than the time of year adopted by the English. For, though he failed on the first of July, or June 90, S. yet he appears not to have arrived in the Eastern ocean till towards the end of September. Shortly after Anakimoff's ship-wreck on Tihutkotkoi-nofs, Defnecf mentions that he landed on the first of October, or September 20, 0. S. and skirmished with the Tihutkhi. Consequently, from the length of the interval between the day of his departure from the mouth of the Kojuma, to his entrance on the Eastern ocean, it may reasonably be inferred that he was waiting for an opportunity of getting through the ice, which he at length effected. Whereas Cook quitted that dreary region on the 29th of August; and Clerke so early as the month of July. The middle and the latter end of September are generally esteemed the most proper periods for navigating the Frozen ocean.

The sole aim of Defnecf being to fail from the Kojuma to the Anadyr, it was not incompatible with his plan to continue on the coast, and to pervére in expecting a favourable occasion for effectuating his purpose, without exposing himself to those difficulties and dangers which beam from more distant quarters must necessarily experience. Whereas the grand design of the English navigators being to ascertain the practicability of a north-eafern passage, and having incontrovertibly determined that important question in the negative, they accomplished the primary object of their expedition. They could not therefore, confidently with their views and instructions, by delaying their departure from those frozen regions, expel themselves to the hazard of being hemmed in by the ice, merely for the sake of evincing the possibility of getting round to the Kojuma.

These circumstances seem to prove that Defnecf actually performed this voyage; yet as he neither made any astronomical observations, nor traced a chart on the coast, his expedition, though it decided the long controversy concerning the separation of the two continents, contributed, however, nothing towards an accurate knowledge of the north-eafern extremity of Asia, for which we are indebted to captain Cook alone. (See Coxe's Russian Discoveries.)

In the year 1785, capt. Billings, an Englishman in the Russian service, was sent by Catharine II. on a voyage of discovery into those parts; and the results of his observations are found to agree with those of captain Cook, placing the easternmost extremity of Asia in lat. 66° 6', and ascertaining its longitude at 102° 22' from Greenwich.

The population of Asia, says Mr. Pinkerton, is by all authors allowed to be wholly primitive and original; if we except that of the Tihutkhi, who by the Russian travellers and Mr. Tooke are supposed to have passed from the opposite coast of America. A few colonists have migrated from Russia to the northern parts, as far as the sea of Kamt-hatka; and well-known European settlements are now being formed in the Ahofan, and the islands to the south-east; but the first serious attempt to colonize what is deemed a part of Asia, was the recent settlement at Port Jackson. With these and other trifling exceptions, Asia presents a prodigious original population, as may be judged from the following table, which will be found more clear than any prior disquisition on the subject.

**Linnean Table of the Nations and Languages in Asia.**

Of the three several appellatives, the first denotes *ordo*, the second *genus*, the third *species*.

1. Affryrians.--Affryrians, Arabians, Egyptians.--Chaldean, Hebrew, &c.
2. Sceymians.--Perfians, Sceymisans intra et extra Imaum, &c. Armenians. (The Parth and Zend are cognate with the Greek, Gothic, Latin, according to Sir William Jones. Indian Difcrt. vol. i. p. 206. The Pehlavi is Affryan or Chaldean. Id. 187, 188, 206.)
4. Seres and Indi.--Hindoos, northern and southern, &c.
5. Sine.--Chinese and Japanese. These have a Tataric form and face: they are probably highly-civilized Tartars, Mongolians, or Mandunars.

Barbaric Nations from north to south, and according to the degree of barbarism.

6. Samoyedes, Oltiaks, Yurals, &c.
7. Yakutes.--Yukagirs. (Expelled Tartars, according to Tooke and Leffeps.)
8. Koriaks.--Tihutkhi. (From the opposite coast of America. Tooke's Ruffia. The Yukagirs are a tribe of the Yakutes, around Yaktifik, and both are expelled Tartars. Tooke's View, ii. 80. Leffeps, ii. 312.)
9. Kamtihatbaks.--Kurilians. (These resemble the Japanese.)
10. Mandunars or Tungufes.--Lamatube. (Ruling people in China.)
12. Tartars or Huns.--Turks, Khafaes, Uzes, and Siberians. Nogays, Bafilkirs, Kirghiikaizaki or Kirghise Kaiszaks, Teleutes.

After the destruction of Attila's swarms, and the effects of unfortunate invades, the Huns became subject to the Mongolians, who under Zingis or Chingis khan, Timur, &c. constituted the supreme nation in Asia. The great share of population which Europe has received from Asia will appear from the following brief statement.

**Primitive Inhabitants.**

2. Fins (chief god Pammala).--Finlanders, Ethhonian, Laplanders, Hungarians, Permans or Barmians, Livonians, Voitkis and Chameriuflis, Vogules and Oltiaks.

Coloines from Asia.

3. Sceymians or Goths (Oluns).--Icelanders, Norwegian's, Swedes, Daes, Germans, English, Swifs, Frisic, Flemish, Dutch.

The inhabitants of France, Italy, and Spain, are also of Asiatic origin; and speak corrupted Roman, which, like the Greek, is a polished dialect of the Gothic, according to Sir William Jones, and other able antiquaries. The Heruli, Vende, and Lettes, used mixed and imperfect dialects of the Slavonic.

Besides these numerous original nations, the Malays and Asiatic islanders constitute another large and distinct class of mankind, with a peculiar speech, in the south of the extensive continent of Asia.
It appears that not above one quarter of Asia was known to the ancients; and this knowledge was little increased till Marco Polo, whose travels became well known in Europe in the fourteenth century, established a memorable epoch in geography, by passing to China, and disclosing the extent of that country, the islands of Japan, and a faint intelligence of other regions, illustrated and confirmed by recent accounts. The wide conquests of the famous Tingham-khan, commonly called Zingis, in the beginning of the thirteenth century, first opened the discovery of the distant parts of Asia; the Mongoles, whole sovereign he was, being situated to the east of the Hans, who had before diffused terror over Europe. The primitive feat of the Mongoles was in the mountains which give source to the river Onon; and at a short distance to the south-west was Kara-kum, the first capital of the Mongol empire. The victories of Zingis extended from Cathay to the northern part of China, to the river Indus; and his successors protected them over Russia, while they made incursions as far as Hungary and Germany. The power of the Mongoles, thus widely diffused, naturally excited an attention, never stimulated by a number of petty barbaric tribes; and at the same time facilitated the progress of the traveller, who, as in Africa at present, had been formerly impeded by the enmities of diminutive potentates. By force of arms the Mongoles also first opened the obscure recesses of Siberia. Shibli khan, in the year 1242, led a horde of fifteen thousand families into those northern regions; and his descendants reigned in the Tobolky above three centuries, till the Ruffian conquest. (Gibbon, ii. 424.) Two European travellers, Carpini and Rubruquis, being commissioned to inspect the power and resources of the new empire of the Mongoles, the latter found at Kara-kum a Parifian goldsmith employed in the service of the khan; and by Carpini’s relation it appears, that from their brethren in Siberia, the Mongoles had received some intelligence concerning the Samoyedes.

Thus the discovery of Asia, which had lain nearly dormant since the time of Ptolomy, began to revive in the thirteenth century. Yet after the publication of Marco Polo’s travels, little was done for two centuries; and the authenticity of his accounts even began to be questioned. From the map of the world by Andrea Bianco, the Venetian, 1440, it sufficiently appears that the discoveries of Polo had, even in his native country, been rather diminished than increased. (See Formacomi, faggia fula nautica antica de Veneziani, Ven. 1783, 8vo.) See also the description of Asia by pope Pius II., who appears not even to have seen the travels of Polo. One man indeed of great mental powers, was impressed with their veracity, and in consequence accomplished a memorable enterprise. This was Chriftofalo Colon, or as we call him, Christopher Columbus; who, led by the relation of Polo, conceived, that as Asia extended so far to the east, its shores might be reached by a short navigation from the western extremity of Europe. In this erroneous idea, when that great man discovered the islands now called the West Indies, he thought that he had arrived at the Zangofo of Polo, or Japan; and thus the name of India was absurdly bestowed on those new regions.

After the discovery of America and the cape of Good Hope, the maritime parts and islands of Asia were successively diffloled. Yet the recent voyages of the Ruffian navigators, of our immortal Cook, and of the unfortunate La Peyrouse, evince that much remained to be done. Concerning the interior of Siberia, scarcely any solid information was had till Peter the Great, after the battle of Pul- tava, sent many Swedish prisoners into that region; and Strahlemburg, one of the officers, published an account of Siberia; which, though extremely inaccurate and defective, opened the way to farther intelligence. The knowledge thus obtained was greatly improved and augmented by the well-known journeys of Pallis and the other academicians. Our acquaintance with Asia is still however far from being perfect, especially in regard to Daouria, and other regions near the confines of the Ruffian and Chinese empires; not to mention central Asia in general, Thibet and some more southern tracts; nor had even the geography of Hindostan been treated with tolerable accuracy, till major Kennell published his excellent map and memoir.

The religions of Asia are various; and the climate admits of every variety, from the equator to the Arctic sea. Though Asia cannot vie with Europe in the advantages of inland seas, yet, in addition to a share of the Mediterranean, it possesses the Red sea (the Arabian sea), and the gulf of Persia, the bays of Bengal and Nankin, with other guls, which diversify the coasts much more than those of Africa or America, and have doubtles contributed greatly to the civilization of this celebrated quarter of the globe.

The Red sea, or the Arabian gulf of antiquity, constitutes the grand natural division between Asia and Africa; but its advantages have been chiefly felt by the latter, which is entirely deficite of other inland seas; Egypt and Abyfiinia, two of the most civilized countries in that division, having derived great benefits from that famous gulf, which, from the straits of Babelmandel to Suez, extends about 20° or 1470 Ruffian miles; terminating, not in two equal branches, as delineated in old maps, but in an extensive western branch, while the eastern ascends little beyond the parallel of mount Sinai.

The Persian gulf is another noted inland sea, about half the length of the former, being the grand receptacle of those celebrated rivers the Euphrates and the Tigris.

The other guls do not afford such strong features of what are properly termed inland seas. But the vast extent of Asia contains seas totally detached, and of a different description from any that occur in Europe or other quarters of the world. Such is the Euxine, and likewise the Caspian, which extends about ten degrees, or 700 miles in length, and from 100 to 200 in breadth. Strabo and Phrygius supposed this sea to be a gulf, extending from the northern ocean; though Herodotus, many centuries before, had delivered quite notions of it. The Caspian, however, seems, at some remote period, to have spread farther to the north, where the deferts are still sandy and saline, and present the same shells that are found in the Caspian; yet that chain of mountains which branches from the head of the Ural to the north of Orenburg, and reaches to the Volga, must in all ages have restricted the northern bounds of the Caspian. To the east, this remarkable sea, in the opinion of most geographers, extended, in times not very distant, to the Aral. This sea, or lake Aral, a hundred miles eastward of the Caspian, is about 200 miles in length, and about 70 miles in breadth; receiving the river anciently called Iaxartes, more recently the Sitr or Sichon, and the river Gihon, the Ouxus of antiquity; both streams of considerable course, flowing from the mountains Belur Tag or Imus. The Aral sea being surrounded with sandy deserts, has been little explored; but it is salt, like the Caspian, having many small saline lakes in its vicinity.

Another remarkable detached sea is the Baikal in Siberia, or Ataritic Russia, extending from about the fifty-first to the fifty-fifth degree of north latitude, being about 350 British miles in length, though its greatest breadth is not above 35. The water is fresh and pure, yet of a green or tea tinge, commonly
commonly frozen in the latter end of December, and clear of ice in May.

Paffing by the other Aficic seas of inferior note, a few observations may be offered on the remarkable Strait that divides Asia from America. This Strait, which, as we have already seen, was discovered by Bering, and afterwards by Cook, is about thirteen leagues or near forty miles in breadth. Bering actually passed this Strait in 1728, probably in the utmost fury of the climate, without discovering land to the cast; but our great navigator gave the name of that Danish adventurer to these Straits, when he afterwards explored them with his usual accuracy. On the Aficic shore is the Eait-cape; and on the American that called Prince of Wales. The depth of water in the Strait is from twelve to thirty fathoms. To the north of these Straits the Aficic shore tends rapidly to the west, while the American proceeds nearly in a northern direction, till, at the distance of about four or five degrees, the continents are joined by solid and impenetrable beds of ice.

In the Aficic seas are numerous shoals or sand-bars; but few of them have been described as conducive to human industry.

The chief rivers of Asia are the Kiangsu and Hoang Ho, the Lena, the Yenifer, and the Obi, streams which rival in the length of their course any others on the globe. Next in confluence are the Amoor, and the Makanung of Laos, if the course be rightly delineated, the Samoq or Batram-pooter, and the Ganges; compared with all which the Euphrates and Indus are but moderate streams.

The Aficic mountains are reputed not to equal the European in height. The Uralian chain forms one of the boundaries of Europe; and the Alpian ridge may be classed among the most extensive of the globe, reaching from about the seventeenth degree of latitude north, to about the hundred and forty-third degree of latitude north, or about 5000 miles, thus riving in length the Andes of South America. But, as chains of mountains rarely receive uniform apppellations, except from nations highly civilized, the Alpian chain, beyond the sources of the Yenifer, is called the mountains of Sayanik; and from the south of the sea Baikal, the Yablonmoy mountains, branches thereof extend even to the country of the Thukhtih, or extreme boundaries of Asia. The chain of Siberia may perhaps be regarded as a part of the Alpian, branching to the south; while the Taurus, now known by various names in different countries, was by the ancients considered as a range of great length, reaching from cape Kebdoni, on the west of the gulf of Satiala, through Armenia, even to India; this last chain, however, has not impressed modern travellers with the same idea of its extent. To the south of the Alpian range extends the elevated desert Goby or Shamo, running in a parallel direction from east to west; and the high region of Thibet may be included in this central prominence of Asia. Other considerable ranges of mountains are Bogdo, Khanjab, Belur, those of Thibet, the eastern and western Gants of Hindoostan, and the Caucaian chain between the Enucle and the Cappadocia.

The Aficic governments are almost universally despotic; and the very idea of a commonwealth seems utterly unknown to that quarter of the world. The mildest syllabons are perhaps those found in Arabia. (See Pinkerton's Modern Geography, vol. ii.)

Asia, Proper, in Ancient Geography. Much perplexity has arisen among authors by the diverse acceptations of the term Asia; so as to render it extremely difficult for their readers to know what region was distinctly understood by that appellation; nor is it easy to reconcile the apparent inconsistency between the sacred and profane writers as to the provinces comprised under the denomination. The ancient geographers divided the vast continent that was known to the Greeks and Romans under the name Asia, into the Great or Lesser Asia. The Lesser, commonly termed Asia Minor, comprehended a great number of provinces; but that which included Phrygia, Mytilus, Caria, and Lydia, was designated Asia Proper, or Asiaproperly so called. Cierd (Cierd, pro. Flaco.), enumerating the regions confided to Asia Proper, makes no mention of Azokis or Ionia, though undoubtedly a district of it, as being comprehended partly in Lydia and partly in Mytilus. Lydias being the inland country commonly known by that name, contained also Ionia, lying on the sea bide, between the rivers Hermes and Meander; and Ionia, extending from Hermes to the river Caicus (Ptol. lib. v. cap. 2.), to the promontory Lestic (Strabo, lib. xii. p. 333.), the ancient boundary between Troas and the sea-coast of the greater Mytilus. Accordingly, Asia Proper comprehended Phrygia, Mytilus, Lydias, Caria, Azokis, and Ionia. This tract was bounded, according to Ptolemy, on the north by Bithynia and Pontus, extending from Galatia to Propontis; on the east by Galatia, Paphlagonia, and Lydias; on the south by part of Lydias and the Rhodesan sea; on the west by the Hellespont, by the Aegean, Scarnian, and Myrian seas. It lies between the thirtieth and forty-first degree of north latitude, and extends in longitude from 55 to 62. As Asia Proper is but a part of Asia Minor, so the Lydian Asia is only a part of Asia Proper. Asia, in this acceptation, comprehends Lydias, Azokis, and Ionia; and is that Asia whereof mention is made in the Acts, and the Apocalypse. Aristotle tells us that Smyrna was at first polissied by the Lydians (Aristot. lib. de poetica apud Plutarch in lib. de vita & poeno Homerii); and Scylax Coranendis reckon it among the cities of Lydia, as also Ephesus, Sardis, Philadelphia, and Thyatira, are reckoned by Ptolemy among the cities of Lydias, as is Laodicea by Stephanus. (Steph. de Urbib.)

That in ancient times Lydia was called Moeonia, and the Lydian Moeonians, is manifest from Herodotus, Diodorus Siculus, Dionysius Afer, Strabo, Plinius, Stephanus, and others; and that Moeonia was called Asia, is no less plain from Callinus, who flourished before Archilochus, from Demetrius Scopilus, contemporary with Ctesis, and Aristarchus the grammarians, from Erupilus, Suidas, the greatest etymologist; &c.; nay, that Lydia was formerly called Asia is expressly affirmed by the ancient schole of Apollonius Rhodius. From whence Lydia borrowed the name of Asia is altogether uncertain; some deriving it from a city of Lydia, seated on mount Tmolus; others from one Asia, king of Lydia, who, according to the Lydians, communicated his name to the whole continent. But, be that as it may, it is certain that Lydia has a better claim to the name of Asia than any other part of that continent.

Asia, in Modern Geography, falls into the following divisions: Tartary, China, India, Persia, Turkey in Asia. Tartary is divided into Chinese, Independent, and Russian; Chinese Tartary contains the country of the Mandins, and that of the Mongol Tartars; Independent Tartary contains the dominions of the khan of the Cears or Kalmukes, the country of the Uibets Tartars, the Ughet, Cernisia, and the tribes inhabiting mount Caranther; Russian Tartary contains the governments of Akkranhan and Kazan, and Siberia. China is divided into the northern provinces of Pechi or Kekin, Changhai, Xénéf, Honan, Canton, from cast to west, and the southern provinces of Nankin, Chekiang, Kiangsi, Fokiin, Hupeh, Quanton, Quangti, Quocheu, Yunnan, Suchuen, from cast to west. India is divided.

Asi, in Mythology, was one of the nymphs, called Oceanides; and according to Diodorus, the wife of Japeus. ASIANO, in Geography, a town of Italy, in the princi- pality of Piedmont and Jordiph of Vercelli, four miles south of Vercelli.

ASIANTE, a country of Africa, eaitward of the Gold Coast, situated about N. lat. 5° 35', and the fame longitude with London.

The aarcha differed from the Galata reche, Syriarcha, &c.

ASIA, in Biography, is a surname given to L. Scipio, the brother of Scipio Africanus, after his defeat of Antio- chus king of Syria.

ASIA, in Geography, a part of Asia, which comprehended eight provinces that were governed by the vicar, or lieutenant of Asia, viz. Lydia, Caria, Phrygia, and the proconfural Hellepont.

ASIA, in History of Literary Establish- ments. See Society.

ASIA, in Rhetoric. See Style.

ASIATICA, in Entomology, a species of Chrysoloma, found in Siberia. The form is oval; colour brassy-green, very glossy; wing-cases blue. Fabr. Spec. Inf. Gmel. &c.

ASIATICA, an Asiac species of Blatta, described by Professor Pallis, It. 3. p. 263. It is of a grey colour, and oblong form; the wings and wing-cases are longer than the body, and narrow or pointed at the end. Gmel. &c.

ASIATICA, a species of Syrinx, found in the island of Antigua,
Inhabit with their hatch; and which, deprived of the name of the East Indian, feeds on fish.

ASIATIC, a species of Exereria, found in the East Indies, where it is called Cuckoo. We know very little of this bird; it is of small size, being about four inches and a half in length. Bill pale ovo-colour; head, neck, back, breast, and belly cinnamon, palest beneath; wings and tail brown, with paler edges; legs pale blue. Latham. In the Ind. Orn. it is described specifically, as being of a cinnamon colour; wings and tail brown.

ASIATIC, a species of Columba, that inhabits India. The colour is greenish ash; head ash; under side of the body white, and a spot of the same on the wings; quill-feathers black with a white exterior margin. The length of this bird is eleven inches; bill bluish at the base, and white towards the tip; tail greenish ash, dusky at the end; legs bluish; claws black. It is called the Indian pigeon. Latham. Ind. Orn.

ASIATIC, a species of Certhia, or creeper, that inhabits India. It is about four inches in length, and briefly described as being of a deep blue, with brown wings; black bill, and legs of the same colour. Latham. Ind. Orn.

ASIATICUS, a new species of Falco, described by Dr. Latham in the Supplement to his Synopsis of Birds. The length is twenty-one inches; and though smaller, it resembles the common buzzard. The bill is bluish black; breast cream colour, dashed down the shafts with dusky black; belly, thighs, and vent white; quills grey, barred with black; on the secondaries a bar of the same. In his Ind. Orn. this bird is thus specifically described: legs half-doway and yellow; body brown above, beneath white; breast streaked, tail-feathers silvery grey, with five obsolete bands on the exterior ones. Inhibits China, and is called in England the Asiatic falcon.

ASIATICUS, a species of Carpiulus, described by Dr. Latham, Sup. Gen. Syn. under the name of Bombay Gout-fucker. It is pale ash colour clouded with black, and ferruginous breast fuscated with ash-colour; a blackish streak on the crown of the head, a pale one on each side of the jaw, and a pale spot on the throat; length eight inches and a half. Inhibits India. In addition to the foregoing specific character, it may be observed, that the plumage of this bird is an elegant intermixture of ash-colour and brown; and that between the legs it is of a pale rufous; quills dusky, barred with rufous; four of the greater quills have a spot of white on the inner web; tail marked in the same manner as the quills, except the two middle ones, which are mottled like the back, and the two outer ones have the ends white for about an inch; the middle toe is greatly pectinated.

ASIATICUS, a species of Trogon, in Latham's Ind. Orna noticed by Gmelin. It is green; forehead, crown, and back of the neck red; throat blue, with a red spot; quill and tail feathers black. The length of this bird is nine inches; the red on the forehead is bounded by a white, and on the crown and neck is bounded below by a white line, and on the sides by a black one; legs green. Inhibits India.

ASINELLA, in Geography, a river of Italy, in the kingdom of Naples, which runs into the Adriatic near Penac, in the Abruzzo citra.

ASINI, in Entomology, a fpecies of Pediculus that infects the afs. The head is porrected and obtufe; abdo- men ovate and flirted with brown. Fabricius, Redi, Rcf.

ASINIUS LAPIS, a name given by fome writers of the middle ages to a tone faid to be found in thofe places frequented by the wild afs. See BEZOBAR.

ASINIUS PALLAS, in Biography. See POLLIO.

ASINIUS, or ASS, in Zoology, a quadruiped of the Horse kind, or genus Equus in the Linnean fystem of animals; a native originally of the mountainous deferts of Tartary, of Arabia, Peria, and fome other fouthern parts of the Aftat'c continent, and Africa; and at prefent very generally domesticated throughout moft civilized countries.

In point of fize, of strength, and of beauty, the varieties of this fpecies, like other domeftic animals, have undergone many changes, and differ considerably from each other. Thofe of the eafther parts of the world, who continue to en- joy the advantages of a climate entirely congenial with their nature, are still offered to poffefs nearly all that activity, that energetic spirit and beauty of appearance which charac- terife this animal in a flate of independent wildnefs; they prefent a race of beings in almofl every reipct the very revere of thofe abijeft creatures, their degenerare offspring, which we are daily accustomed to fee employed in the meanest acts of fervitude in the norther parts of Europe. But although the shades of degradation are fo much more strongly marked in the latter kinds, than in the refi, all may be definitive traced to a few diftine varieties, and thofe again to the fingle fpecies, the primeval fstock from which they were at firft derived.

The character of the afs, as Linneus defines it, conflits in having the tail brifly at the extremity, and a black crofs over the fhoulers. To this his editor Gmelin adds, that the hoofs are folid; and that the black crofs on the fhoulers is peculiar to the male. According to Briffon Quad. it is an Equus with long fheathing ears, and fhort mane.

Gmelin divides the fpecies Asinus into four varieties, viz. ferus a., afinus fivelfris, domelficus b., malus q., and bimus d. The firft is the wild afs, onager of Pliny and other ancient writers; onagrus, onager, five afinus fivelfris of Gmelin: equus (onager) auriculis longis, juba brevi, pelle tabeboialis parvis (fabra of Briffon; laine fauvage of Marmol); af- and wilder efled of Pallas.—The domeftic, or fearch variety, varying much in different countries, is notwithstanding well known in Europe by the feveral names of common afs; Eng. pane, and Panaffe, Fren. Afno micio, f. micio, It. Afno horreco, f. horreco, Spa. Afno horreco, f. afera borra, Port. Efel, Germ. Exzel, Dut. Afsn, Swed. Afer, afer, Danifh. —Miinus, or mule, the third variety, it is almost uneceffary to remark, is the hybrid offspring of the male afs with a mare; and hinnus, the hinnay, a fimilar hybrid product of the male horse with the female afs, and, flightly speaking, ought not to be deemed varieties of the fpecies, afinus, but rather monfeters, as being out of the courfe of nature.

Wild afs were perfectly well known to the ancients; they are faithfully defcribed by Pliny and Poppian; and among the fared writings are frequent allusions to them. They uniformly attracted the notice of travellers in Asia and Africa; and profefor Pallas in particular has treated on them with his accustomed accuracy. The appearance both of the wild and tame afs in thofe parts of the world is al- together flirking. "It was with difficulty," says Adanfon, when speaking of the afses of Senegal, "that I could recog- nize this animal, so different did it appear from thofe of Europe; the hair was fine, and of a bright mouse colour; and the black hit that crosses the back and fhoulers had a good effect. These were the afses brought by the Moors from the interior of the country." From the belt authorities it appears, that in a natural state, the afs has a foft woolly mane; a forehead greatly arched; and ears long, erect, and pointed, particulars in which it differs most obfiously from the domefticated kind, which has the ears flouching, and the forehead flatfeft. The former flands afio higher on its limbs, and the legs are more flender in proportion. The colour of the hair is white or silvergrey; the upper part of the face, the fides of the neck, and body, inclining to a fraw colour, and the hind part of the thighs the fame; the fore part divided from the flank by a white line, which extends quite round from the rump to the tail: the belly and legs are alfo white; along the very top of the back, from the mane quite to the tail, runs a ftripe of bulky waved hairs of a coffee colour, broadfed above the hind part, and growing narrower towards the tail; another of the fame co- colour crosses it at the fhoulers, and forming a fimilar mark to that by which the fame afs is diftinguifhed. This is peculiar to the male, and is bounded on each fide by a line of white. Its winter coat is very fine, soft, and milky, much undulated, and not unlike that of the camel; greatly to the touch, and the flaxen colour more vivid than in the fummer. In its fummer dress, there are certain fhaded ftares that mark the fides of the neck, pointing downwards. These animals inhabit the dry and mountainous parts of the defferts of Great Tartary, but not higher than lat. 48°. They are migratory, and arrive in vast troops, to feed during the fummer, in the tracts to the eaf't and north of lake Aral. About autumn they collect in herds of hundreds, and even thou- fands, and direcf their courfe towards the noth of India, to enjoy a warm retreat during winter. But they more ufually retire to Peria, where they are found in the moun- tains of Cabin, and where part of them remain during the whole year. According to Barbago, they penetrate even into the southern parts of India, to the mountains of Malabar and Golkonda. The Kirghifes and Arabs hunt them, or take them in fnares, for the fake of their flefh. At firft when the animal is killed, the meat is hot and unfaftory; but if kept two days after it is boiled, it becomes exellent. The flefh of wild afses, it is well known, was esteemed an article of food among the ancient Romans.

The wild afs feeds chiefly on the moft famine or bitter plants of the deffert, as the kali, atriplex, chenopodium, &c. and also prefers the falteft and moft brackifh water to that which is freh. Of this the hunters are aware, and usually station
A SINUS.

flung themselves near the ponds to which they resort to drink. Their manners greatly resemble those of the wild hares. They assemble in troops under the conduct of a leader, or centaur; and are extremely shy and vigilant. They will however flop in the midst of their course, and even suffer the approach of man at that instant, and then dart off with the utmost rapidity. They have been at all times celebrated for their swiftnefs. Their voice resembles that of the common afs, but is shriller.

The Persians catch these animals alive for the sake of domesticking them, or improving the breed of tame afs; they feed, for this purpose, pits of a convenient size and depth, which they half fill with plants, both as a temptation to the creature, and to break its fall. The breed of afs in such high esteem in the east, is produced by crossing the tame kind with the afs reclaimed from a state of wildness. These animals were anciently found in the Holy Land, Syria, Arabia Desert, Mesopotamia, Phrygia, and Lycaonia; but they rarely occur in those parts at this time; and seem to be almost entirely confined to Tartary, some parts of India, and Africa.

It is said, that neither afs nor horses were found in America, although the climate of South America is perfectly adapted for them. Those which the Spaniards transported from Europe, and left in various parts of the New Continent, have greatly multiplied, and are found in troops in a state of nature at this period.

The excellencies and defects of the common or domestic afs have amply engaged the lively pens of several descriptive writers on the history of animals; and of none with more happy effect than thofe of the eloquent Buffon, and the ingenious abbé la Pluche: of the latter we shall speak hereafter: the former after entering minutely into a comparison between the horse and the afs, and endeavouring to prove that the two species are distinct (a fact which cannot well be doubted), concludes in a style of language so beautiful, so animated, and well calculated to enforce the tenor of his preceding arguments, that we cannot refrain infenting some few extracts from it.

"The afs is then an afs," says Buffon, "and not a horse degenerated, a horse with a naked tail. The afs is neither a stranger, an intruder, nor a battard; he has, like other animals, his family, his species, and his rank; his blood is pure and untainted, and although his race is less noble, yet it is equally good, equally ancient, with that of the horse. Why then is there so much contempt for an animal so good, so patient, so steady, and so useful? Do men despise, even among animals, those which serve them best, and at the smallest expense? We educate the horse, take care of, instruct, and exercise him, whilst the afs is abandoned to the power of the lowest servant, or the tricks of children; so that instead of improving, he must lose by his education, and if he had not a fund of good qualities, he would certainly lose them by the manner in which he is treated. He is the sport of the ruffians, who beat him with flacks, abuse him, overload him, and work him beyond his strength. We do not consider that the afs would be in himself, and, with respect to us, the most beautiful, best formed, and most distinguished of animals, if there were no horses in the world; he, however, holds the second, instead of the first rank, and it is from that only that he appears to be of no value. It is comparison alone degrades him; we look at, and give our opinions, not of himself, but comparatively with the horse. We forget that he is an afs, that he has all the qualities of his nature, all the gifts attached to his species, and only think of the figure and qualities of the horse, which are wanting in him, and which he ought not to have.

"He is naturally as humble, patient, and quiet, as the horse is proud, ardent, and impetuous; he suffers with conftancy, and perhaps with courage, chafftement and blows; he is moderate both as to the quantity and quality of his food; he is contented with the hardest and most disagreeable herbs, which the horse, or other animals, will leave with disdain; he is very delicate with respect to his water, for he will drink none but the clearest, and from rivulets which he is acquainted with; he drinks as moderately as he eats, and does not put his nose in the water through fear, as some say, of the shadow of his ears; as care is not taken to comb him, he frequently rolls on the grafs, thistles, and in the dust; without regarding his road, he lies down and rolls as often as he can, and seemingly to reproach his master for the little care he takes of him, for he never wallows in the mud or in the water; he even fears to wet his feet, and will turn out of his road to avoid it; his legs are also drier and cleaner than those of the horse; he is susceptible of education, and some have been seen sufficiently disciplined for a public show."

"When young, they are sprightly, handsome, light, and even graceful; but they soon lose those qualities, either from age or bad treatment, and become slow, stubborn, and headstrong. The afs is ardent in nothing but love; or rather when under the influence of that passion, he is so furious that nothing can restrain him; he has been known to exhaust himself by excessive indulgence, and die some moments afterwards. As he loves with a kind of madness, he has also the strongest attachment to his progeny. Pliny affirms us, that when they separate the mother from her young, she will go through fire to recover it. The afs is also strongly attached to his master, notwithstanding he is usually ill-treated; he will scent him at a distance, and distinguish him from all other men. He also knows the places where he has lived, and the ways which he has frequented. His eyes are good, and his smell acute, especially with regard to females; his ears are also excellent, which has contributed to his being numbered among timid animals, who, it is pretended, have all long ears, and the hearing extremely delicate. When he is overladen, he shows it by lowering his head, and bending down his ears: when greatly abused, he opens his mouth, and draws back his lips in a most disagreeable manner, which gives him an air of derision and scorn. If his eyes are covered, he remains motionless; and when he is laid down, and his head fiixed, that one eye rests on the ground, and the other being covered with a piece of wood, he will remain in that situation without endeavouring to get up. He walks, trots, and gallops like the horse, but all his motions are smaller and much slower. He can however run with tolerable rapidity, but he can hold it only for a small space, and whatever pace he ues, if hard pressed, he is soon fatigued."

"The horse neighs, but the afs brays; which he does by a long, disagreeable, and discordant cry, by alternative discords of sharps and flats. He seldom cries but when he is puffed by love or appetite. Thehorse has her voice clearer and more thrills." Buff.

"I confess," says the abbé la Pluche, "that the afs is not matter of very shining qualities; but then he enjoys those which are very solid. If we refer to other animals for distinguished services, this at least furnishes us with such as are most necessary. His voice is not altogether melodious, nor his air majestic, nor his manners very lively; but then a fine voice has very little merit with people of solidity. With him the want of a noble air hath its compensation in a mild and modest countenance; and instead of the boisterous and irregular qualities of the horse, which
which are frequently more incommodious than agreeable, the behaviour of the as is entirely simple and unaffected; no superciliations and self-sufficient air. He marches with an uniform pace, and though he is not extraordinarily swift, he pursues his journey for a long time, and without interruption. He finishes his work in silence; serves you with a steady perseverance, and discovers no ostentation in his proceedings, which is certainly a considerable accomplishment in a domestic. His meats require no preparation, for he is perfectly well contented with the first that presents itself in his way. He does not pretend that any thing is due to him, and never appears squeamish or discontented; he thankfully accepts whatever is offered him; he is not an elegant relish for the bed things, and very civilly contents himself with the most indifferent. If he happens to be forgotten, or is followed a little too far from his fodder, he investigates his master, in the most pathetic language he can utter, to be so good as supply his necessities. It is very just that he should live, and he employs all his rhetoric with that view. When he has finished his expostulations, he patiently awaits the arrival of a little bran, or a few withered leaves; and the moment he dispatches his meal, he returns to his business, and marches on, without a murmur or reply. His occupations have a tinge of the meanest of those who set him to work; but the judgments that are formed, both of the as and his master, are equally partial. The employments of a judge, a man of consequence, and an officer of the revenue, have an important air, and their habit imposes on the spectators; on the contrary, the labour of the peafant has a mean and contemptible appearance, because his drefs is poor, and his condition deplor. But we really make a false estimate of these particular. It is the labour of the peafant which is most valuable, and alone truly necessary. Of what importance is it to us when a manager of the revenue glitters from head to foot with gold; we have no advantage from his labours. I confess, judges and advocates are, in some measure, necessary; but they are made so by our folly and misbehaviour; for they would be no longer wanted, could we conduct ourselves in a rational manner. But, on the other hand, we could on no account, and in no season or condition of life, be without the peafant and the artisan. These people may be considered as the souls and sinews of the community, and the support of our life. It is from them we are constantly deriving some accommodations for our wants. Our horeses, our habits, our furniture, and our sufficiency, rise out of their labours. Now what would become of your vine-dressers, gardeners, nasonis, and the generality of country people, that is to say of two-thirds of all mankind, if they were destitute of either men or horses to convey the commodities and materials they employ and manufacture? The as is perpetually at their service: he carries fruit, herbs, coal, wood, bricks, tiles, plaster, lime, and straw. The most abject offices are his ordinary lot, and it is a singular advantage to this multitude of workmen, as well as ourselves, to find a gentle, strong, and indefatigable animal, who, without either expense or pride, replenishes our cities and villages with all sorts of commodities. A short comparison will complete the illustration of his services, and is some measure raise them out of their obscurity. The horse very much resembles those nations who are fond of glitter and hurry; who are perpetually finging and dancing, and extremely fluidious to set off their exterior, and mix gaiety in all their actions. They are admirable on some distinguished and decisive occasions; but their fire frequently degenerates into romantic enthusiasm; they fall into wild transports; they exhaust themselves, and lose the most favourable conjunctures for want of management and moderation. The as, on the contrary, resembles those people who are naturally heavy and solid, whose understandings and capacity are limited to hustled or commerce, and who proceed in the same track without discomposure, and complete, with a positive air, whatever they have once undertaken.

Of all animals that are covered with hair, it is believed the as is the least subject to vexation; and the authors of the Encyclopaedia Britannica have even ventured to say, that it is never troubled with lice. This opinion is altogether erroneous, and the more unaccountable, since a slight acquaintance with the entomological writings of Redi, Linnaeus, Fabricius, and several others, might have convinced them that it is not only infected with lice, but even with a species peculiar to itself, and for that very reason named asini, or hoste of the asis. Pediculus asini, Red. Exp. 21. Pediculus asini, Linn. Pediculus asini, capite porrecto obtuso albo-mine ovato. Ovato fucco. Fabr. &c. The skin of the as is extremely hard and very elastic, and is used for various purposes: such as to cover drums, make shoes, or parchment. It is of the skin of this animal that the orientals make the fagri, or, as we call it, thygreen.

At two years and a half old, the first middle incisive teeth fall out, and the others on each side coniue follow; they are renewed at the same time, and in the same order as those of the horse. The age of the as is also known by his teeth in the same manner. From the age of two years and a half the as is capable of procuring its kind, and the female will earlier. The females are in heat in May and June, which, when pregnant, soon goes off. In the tenth month, milk is found in its dug, and the brings forth in the twelfth, and very rarely has more than one foal. Seven days after the is capable of again receiving the male. At the end of five or six months the foal may be weaned; and it is even necessary, if the mother be again pregnant. The male as should be chosen from the largest and strongest of his species; he must at least be three years old; but should not exceed ten; his legs should be long, his body plump, head long and light, eyes bright, nostrils and cheeks large, neck long, loin's flabby, ribs broad, rump flat, tail short, hair thinning, foot to the touch, and of a deep grey.

The as, like the horse, is three or four years in growing, and lives also like him twenty-five or thirty years; it is said the female lives longer than the male, but perhaps this happens from their being often pregnant, and at those times having some care taken of them, instead of which the males are constantly worn out with fatigue and blows. They sleep less than the horse, and do not lie down to sleep, except when they are exceedingly tired. The male as also lives much longer than the female; the older he is, the more ardent he appears; and, in general, the health of this animal is much better than that of the horse; he is less delicate, and not nearly so subject to maladies.

There are among asses, as among horses, different races, though they are much less known, because they have not been taken the same care of, or followed with the same attention. Travellers inform us, that there are two forts of asis in Perse, one of which, being slow and heavy, is used for burdens; and the other is kept like horses for the saddle. The latter have smooth hair, carry their head well, and are much quicker in motion; but when they ride they rest nearer the buttocks than when on horse-ack. They are drenched like horses, and like them are taught to amble; and they cleave their nostrils to give them more room for breathing. According to Dr. Raffaelli, there are two forts in Syria, one of which are like ours, and the other very
very large, with remarkable long ears; but both kinds are employed for the purpose of carrying burdens.

The wild mule, the *hemionus* of Pallas, has no claim to consideration in this place. It constitutes a distinct species of *equus* from the species *symius*, in Gmelin's arrangement, under the same specific name, applied to it by Pallas; and will be noticed hereafter in the article HEMIONUS. The common mule, engendered between the male ass and mare, is much cultivated in Spain, and is little inferior in size to its female parent.

The ass was one of the unclean animals under the Jewish law, as it did not chew the cud; and it prohibited coupling an ass with an ox for draught: Lev. xi. 26. The Jews were sected by the Pagan of worshipping the head of an ass. See ASINARI.

The author of this history seems to have been Appian the grammarius; for he affirms (Josephus, contra Apion, i.ii.) that the Jews kept the head of an ass in the sanctuary; and that it was discovered there when Antiochus Epiphanes took the temple, and entered into the most holy place. Suidas also says (in *Dioscuri* and in *Judac*) that Damascenius, or Democritus, the historian, averred, that the Jews adored the head of an ass, made of gold, and sacrificed a man to it every three or four years, after having first cut him in pieces. Plutarch (Symp. l. iv. c. 5.) and Tacitus (Hist. i. v.) seem to have been imputed upon by this slander. They believed that the Hebrews adored an ass, from gratitude for the discovery of a fountain by one of these animals, at a time when they were exceedingly fatigued and parched with thirst in the wilderness. The fame absurd idolatrous worship was imputed by the heathens to the Christians. The *Cæcilius* (apud Minut.) says, "Audio Christianos turbamisse pecudum *signum* capita consecratum in aperte nescio quam perficuum veteranim." To the same purpose Tertullian tells us (Apolog. c. 16.), that some enemies to the Christians exposed to public view a picture, representing a person with a bank in his hand, dressed in a long robe, with ass's ears, and one foot like that of an ass, upon which was inscribed, "The God of the Christians has an ass's hoof." Learned Christians have attempted to investigate the origin of this calumny. The report of the Jews worshipping an ass, might originally have been derived from Egypt; to this country it is traced by Tanaquil Faber, who deduces it from the temple in Egypt called *Onion*, derived, as it is suppos'd, from *oxos*, an ass. To this purpose it may be added, that the Alexandrians hated the Jews, and were much addicted to raillery and defamation. And they might have been informed, that the temple *Onion*, at Helopoliis, was named from *Onias*, the high-priest of the Jews, who built it in the reign of Ptolemy Philomctor and Cheoptra, A. M. 5854, ante Chrifi. 152. Joseph. l. xiii. c. 6. Bochart is of opinion (De Animal. Sacr. l. ii. c. 18.) that the error took its rise from a pallace of scripture, "The mouth of the Lord hath spoken it," in the Hebrew *thau* or *thau*; *thau* or *thau*; *thau* or *thau*. Hence, as *piros*, in the Egyptian language, signifies an ass, the Alexandrian Egyptians, hearing the Jews often pronouncing the word *piros*, might believe that they called on their god, and thence infer that they adored an ass. Omitting other conjectures, we shall add, that M. Le Moine supposes, that the golden urn containing the manna, which was preferred in the sanctuary, was taken for the head of an ass, and that the ear, or aurum, of manna, might have been confounded with the Hebrew *hannah*, which signifies an ass. Calmet.

*Asinus Pissis*, in *Ichthyology*, a name given by some old writers, to the common haddock. It was also called onos. Willughby, &c.

*Asio*, in *Ornithology*, a species of *Strix* or owl, described by Linnaeus, the body of which is brown above, and white beneath; and the wings marked with five white dots. This is *le petit due de la caravane* of Bilston, *little soul* of Cateby, *red soul* of Pen. *Art. Zool.* and *red-sured soul* of Latham. Its native place is North America.

Cateby says it is about the size of a jack-daw. The bill and mase of a fashiun colour; tail brown; edge of the baird wing whith; on the quills a few white spots; legs covered to the toes with light brown feathers; toes brown; claws black. Balfin seemed to imagine this bird might be only a variety of the long-eared and American owls, both of which he deemed the same species.

*Asio*, is also a name given by Aldrovandus to the Italian eared-owl, and synonymous with otus: also five otus. Aldr. Ray applied the same name to the long-eared owl or horn-owl of Willyngale and Albin, and five otus of Linnaeus.

*Asiogaler*. See *Elinkogaler*.

*Asiofis*, in *Recent Geography*, a people of Asia, in Scythia, on the side of Imbris. Poikely.

*Asiret*, in *Geography*, a town of Peris, on the south of the Capric sea, in the province of Tabriana, eleven leagues east of Ferabad.

*Asisarath*, in *Ancient Geography*, a town of Arabia, in Mauritania Caesariensis, between the rivers Galus and Amphagus. Poikely.

*Asisha*, a town of Liburnia, the Ailesea or Afferia of Pliny, now in ruins. The traces of ancient magnificence determinable at Poegrea, the seat of Ablin, are numerous. Among the Liberians cities which attended the congress or diet of Scardona, Pliny mentions the free Afferians, who created their own magistrates, and were governed by their own municipal laws, and who were of course more opulent and powerful than their neighbours. The walls of this city appear to have measured in circumference 3000 Roman feet, and to have been constructed with Dalmation marble, some pieces of which are of large dimensions, and brought from a considerable distance.

*Asistium*, or *Asisium*, now *Aifib*, a town of Italy, in Umbria, was a Roman municipality, and situated to the eait of Aven. Pliny mentions the Afitsines. See *Asisi*.

*Asitchou Achashish*, in *Ornithology*, the name by which a species of grotsbeak is known in Hudson's bay and which Dr. Latham supposes to be the white-winged crosbill of his General Synopsis.

*Asita*, in *Medicine*, a lot of appetite, from *a*, private, and *ovis*, food. A symptom which occurs in numerous diseases.

*Asius*, in *Entomology*, a species of *Papilio* (Eq. *Tro*.) that inhabits South America. The wings are tailed, black, with a common white baid; base and tip of the posterior pair beneath spotted with red. Fabr.ics.

*Aska*, in *Geography*, a river of Japan.

*Asker*, in *Zoology*, a name used in some parts of England for the water-nest or *ef*.

*Asker-Mokrem*, in Geography, a town of Asia, on the ealler bank of the Tigris, in the Arabic Irac; called also Semnai.

*Askersund*, a town of Sweden, in the province of Norcia, on the Wetter fea, five miles from Orskro.

*Askeyton*, a market, and, till the union, borough town of the county of Limerick, in Ireland, seated on the small river *Deel*, near its junction with the Shannon; famous for its castle built by the earl of Desmond, and for one of the most beautiful and perfect abbeys in Ireland. Distance from Dublin 105 miles. Long. 8° 52' W. Lat. 52° 42'. 30' N.
ASKRIG, a town of England, in the north riding of Yorkshire, beautifully situated on the banks of the river Ure, at the upper extremity of Wensleydale. It has a weekly market on Thursday; distant 247 miles north from London.

ASLA, a river of Spain, on the northern coast, which falls into a bay in the bay of Biscay, where it forms a good harbour to the east of Cape Pinas.

ASLANI, in Comm. r., a name given to the Dutch dollar, current in most parts of the Levant. The word is also written corruptly, aslan. It is originally Turkish, and signifies a lion, which is the figure flamed on it. The Arabs taking the figure of a lion for a dog, called it abaf-leth. The silica is silver, but of a base alloy, and oftentimes counterfeit. It is current for 115 or 120 aipers. See Aiper.

ASLAPATH, in Geography, a town and district of Asia, in Armenia, near Nackhan, on the banks of the Aras. It is inhabited by Armenians; and the women are said to be so beautiful, that the king of Perse supplies his seraglio from this place.

ASLING, or JESSENIZE, a town of Germany, in Carniola, sixteen miles S. S. W. of Clagenfurt. In this town, which is not far from the river Saar, is dug a fine marble; and near it are lead furnaces, and other works, in which considerable quantities of iron and lead are smelted.

ASMER, a small town of Hindoostan, in the states of the Mogul, south-west of Agra, and in the extremity of the province of Bando, called Alto Aimer.

ASMOEROEA, a mountain of Asia, in the country of the Serees, inhabited by a people called Amorceans, who are dispersed through the province of Cataja, a part of Tartary. Alto, a town of Asia, in the same country, according to Ptomey.

ASMODAI, in Mythology, the name given by the Jews to the prince of demons; and, according to R. Elia, the same with Sammael.

ASMONEAN, in Ancient History, the name given to the Maccabees, the descendants of Mattathias, who, according to Josephus, was the grandson of Ammoneus; though others derive the appellation from Mount Amaran, placed by Josephus in the midst of Galilee, near Sephoris; and others again consider it merely as a title of honour given to Mattathias and his descendants, alleging that casedhuma-nim signifies in Hebrew, princess. However this be, the family of the Ammonianes became very illustrious in the latter period of the Hebrew commonwealth, and possessed the supreme authority and the high-priesthood from the commencement of the government of Judas Maccabees to the death of the Great, during a period of 120 years, or 126 years, according to Josephus, who reckons from the time in which Judas was established in the government by his peace with Antiochus Eupator, three years after he first assumed it. It was the practice of the Ammonian princes to impose their religion upon all the countries which they conquered, leaving to the vanquished no other choice, but either to become Jews, or else to have their dwellings demolished, and to seek new habitations.

ASMURA, or ASMURNA, in Ancient Geography, a town of Asia, in the interior of Hyrcania. N. lat. 39. 30'. Ptolemy.

ASNAH, in Geography. See Enakh.

ASNAUS, in Ancient Geography, a mountain of Europe, in Macedonia, between which and Oceropus was a valley, in which flowed the river Ocas.

ASNEV, in Geography, a lake of Sweden, in the province of Smaland, about North lat. 56° 36'. East longitude 14° 48'.

ASNID, a town of Asia, in the kingdom of Candalas, 23 leagues north of Salem.

ASNIERES, a town of France, in the department of the Upper Vienne, and chief place of a canton in the district of Bellac, 10 miles north-west of Bellac.

ASO, a town of Japan, in the province of Simodzake.

ASODES, in Medicine, a term applied to fevers accompanied with anxiety and oppression about the stomach and præcordia. It is derived from οδος, which, in its primary sense, means a loathing of food; but which is used by Hippocrates, and other ancient physicians, to denote great uneasiness and relieves, whether with or without nausea. It is sometimes written alosis.

ASOLA, in Geography, a town of Italy, in the territory of Brescia, on the river Chiave; which was formerly a fortified place, belonging to the republic of Venice.

ASOLO, a town of Italy, in the district of Treviso, situated on a mountain at the source of the river Mufon; small, but well-peopled. N. lat. 45° 49'. E. long. 12° 2'.

ASONIA, a river of Italy, in the marquisate of Ancona; which rises in the Appennines, on the frontiers of Umbria, and runs into the Adriatic sea, ten miles south-east of Fermo.

ASOPH. See ASOP.

ASOPIA, in Ancient Geography, a country of Peloponnesus, in Sicilyonia. Strabo.

ASOPUS, a town of Laconia, in which was a temple of Minerva Cyparissenís, south-east of Cypris. At the distance of twelve stadia was a temple of Xelcaspus, fennamed Phthibaus, the friend of the people. The citadel is now standing, and called by the sailors Cypel Rumano. Alfo, a river of Berothia, which had its source in Mount Citheron, north-west of Plataea; and passing east by north of this city, discharged itself into that part of the sea which separated the isle of Euboea from the continent over against Eretria, now called Asoppe. Alfo, a river of Sicilyonia, which rose to the south-east, on the frontiers of Arcadia, near Mount Cyllene, ran east of Sicylone, and discharged itself into the gulf of Corinth. Alfo, a river of Greece, in Thessaly, which had two sources in that part of Mount Oeta that was contiguous to Mount Pindus, and running eastward, emptied itself into the Malac gulf, north of Thermopylae. Alfo, a river of Aila Minor, which watered the town of Laodicca upon the Lycus. Phily.

ASOTUS, in Ichthyology, a species of Sildes found in Asia. It has a single dorsal fin, and four cirri at the mouth, two on the upper and two on the lower jaw. The teeth of this kind are numerous; the dorsal fin is dilated of spinous rays; first ray of the pectoral fin is serrated; and the anal fin is long, and connected with the tail.

ASOPAS, in Geography, a town of Persia, in the province of Farfian, twenty-three leagues north of Schiras.

ASP, or ASPIS, in Zoology, a species of Coluber, described by Linneus, as having 146 plates on the belly, and 46 scales on the tail. Dr. Shaw has some doubt concerning the Linnaean aspis, but concludes it is the serpent described under the name of aspis by the cœlant de Cepe, who informs us that it is a native of France, and particularly of the northern provinces of that country. The length is about three feet; the head rather large, and covered with small carinated scales; the scales of the body smaller, but of a similar structure. In the structure of its fangs it resembles the vipers, and is said to be equally poisonous. M. Latrille
is not willing to allow this to be the real Coluber apis of Linnaeus.

In addition to the specific character of the coluber apis (taken from the number of abdominal plates, and scales of the tail), Gmelin observes, that the nose is terminated by an erect wart; the body rufous, with figured streaks, which are alternately confluent, and the under side fleck-blue dotted with yellow. Dr. Shaw calls his coluber apis, the rufecent viper, with roundish, alternate, darkly, durial spots, subconfluent towards the tail; and states the number of abdominal plates to be 155, subcaudal scales 37.

The truth of the ancient seems to be entirely unknown. It is very frequently mentioned by ancient writers, but in such a careless and indefinite manner, that it is impossible to ascertain the species with precision. With the aps it is said the high-spirited princes Cleopatra effected her death, rather than submit herself as a captive to grive the triumphal entry of her conqueror Angilus into Rome. This trait of her rofin in that distinguished character is controlled. The indications of Cleopatra's having occasioned her death by means of an aps, were only two almost infinable punctures observed in her arm; and it is asserted by Plutarch, that it is unknown of what death she died.

Brown places the popular report of her death in this manner among his vulgar errors. Others are of a different opinion. Some have imagined it was the Egyptian viper, described by Haffelquist, which Cleopatra made use of on that occasion. Mr. Bruce is led to conclude, from various circumstances, that it might be the cerales, coluber cerastes of Linnaeus.

"I apprehend," says Mr. Bruce, in speaking of the cerales, "this to be the apis which Cleopatra employed to procure her death. Alexandria, plentifully supplied by water, must then have had fruits of all kinds in its gardens: the basket of figs must have come from thence, and the apis or cerales that was hid in them, from the adjoining desert, where they are plentiful to this day; for to the westward in Egypt, where the Nile overflows, there is no sort of serpents whatever that ever I saw, nor, as I have before said, is there any other of the mortal kind that I know in those parts of Africa adjoining to Egypt, except the cerales. It should seem very natural for any one, who, from motives of diet, has resolved to put a period to his existence, especially women and weak persons, unacquainted to handle arms, to seek the gentlest method to free themselves from the load of life, now become inappetible."—"It is not to be doubted," adds Mr. Bruce still further, "but that a woman, high-spirited like Cleopatra, was also above the momentary differences in feeling; and had the way in which she died not been ordinary and usual, she certainly would not have applied herself to the invention of a new one. We are therefore to look upon her dying by the bite of the cerales, as only following the manner of death which she had seen adopted by those who intended to die without torment. Galen, speaking of the apis in the great city of Alexandria, says, I have seen how speedily they (the apes) occasioned death. Whenever any person is condemned to die, whom they wish to end quickly and without torment, they put the viper to his breast, and suff ering him there to creep a little, the man is presently killed."—

Lord Bacon makes the aps the least painful of all the instruments of death; he supposes its poison to have an affinity to opium, but to be less disagreeable in its operation; which does not so well agree with the description of the symptoms given by Dioscorides and others. Immediately after the bite, the fight becomes drows, a sensible tumour arises, and a moderate pain is felt in the stomach. Matthi-
ner, leal bifid, conformable with the wings: Stau. filaments ten, united into a sheath, gaping longitudinally at the top, ascending, anthers oblong; Pfih, germ ovate, style simple, ascending, stigma sharp; Per. legume ovate, awnsfe; Seeds, generally two, kidney-shaped.

Ess. Gen. Char. Cal. five-cleft, upper divisions largest; Legume ovate, awnsfe, with about two seeds.

Cf. This genus is singular in having several leaves from the same bud, as a flabby plant.

2. A. "Leaves facieOed, bright, rough, includding a gunnaceaeous spine; Flowers lateral, scarcely longer than the leaves; legume small, ovate at the base, triangular, upwards drawn to a point, compresed like a lens, containing two seeds, one compressed kidney-shaped, the other globular. 2. A. *ser-".

3. plu. var. 1. "Leaves facieOed, filiform; buds wart-

4. A. A. 1. A. "Leaves facieOed, linear, sharp, flowers headed, bractes naked." A shrub two feet high, with large buds or warts; leaves deciOed, smooth, sharpish, an inch long; flowers lateral, shorter than the leaves, subdeOed; calyx pubescent, banner villoso.

ments of the calyx pubescent; keel of the flower archd and the length of the banner. 4. A. *glomerata*, glomerata A. "Leaves facieOed, linear, sharp, villoso bent towards, flowers headed, divisions of the calyx ovate, corollas smooth." This differs from the third, in having its leaves bent inward, the calyx ovate, and the corollas smooth. 5. A. *aflota*, flower A. Phuk. Mant. 88 t. 413. f. 3. Seba Mus. 1. t. 23. f. 6. "Leaves facieOed, pubescent, macronate, villoso, flower stellate." This has the appearance of juven."e; it branches very much, and the twigs are covered with hairy down, and loaded with a profusion of flowers.

7. Chamaelabes. Bray. Cent. 23. t. 1. 11. Seba Mus. 1. t. 23. f. 4. "Leaves facieOed, pubescent, macronate, rough with hairs, flowers headed, very biflora." A shrub about three feet high, with slender branches terminated by the flowers, which are yellow, collected in woody heads; the leaves are prickly like thistles of juniper. Cultivated in 1755, by Miller.

7. A. *albus*, white A. "Leaves facieOed, fubulate, filaky, spreading at top, branches of flowers scattered." Shrubby, roundish, and covered with brown bark, which is full of shining, lemon-like flowers; a fubulate, white A. flowers terminating in bunches, tomentoOe, small, of a filaky white; calyx pubescent. Introduced here in 1754, by Mr. Maffon. It flowers in July. 8. A. *thym flo-".

8. A. *thyrs flo-

flora, thyme-leaved A. Gen. minima, &c. Phuk. Mant. 88 t. 413. f. 1. "Leaves facieOed, subulate, unarm, smooth, very short, flowers alternate." This is a very small shrub; the leaves are crowded together and thinning, resembling those of thyme. 9. A. *ericula*, heath-leaved A. Gen. nesb, uniflora, &c. Phuk. Mant. 88 t. 413. f. 6. "Leaves facieOed, linear, unarm, hirlate, flowers alternate, calyxes lineares." A small shrub, very much branched, pubescent, or extremely indusia square; leaves minute; flowers lateral, scarcely longer than the leaves; banner villoso. 10. A. *nigra*, black A. "Leaves facieOed, linear, rather obtuse, flowers head-facile, pubescent. A branching shrub, three feet high, and twigs pubescent; leaves minute, and become black on drying; flowers terminally, pubescent, branches in pairs, caraOe." 11. A. *caes. f.*, hairy A. "Leaves facieOed, almost in linear obtuse, calyxes subpubescent, sharp, corollas smooth." About the height of the tenth species; branches naked; determinate; leaves pubescent, fleshy, branch in, smooth, four or seven together; flowers yellow, terminal, unarm; calyx bell-shaped; bractes three, ovate lanceolate. 12. A. *ciliata*, "Leaves facieOed, filiform, fea-".

13. A. *gentian*, brown-like A. "Leaves facieOed, filiform, pubescent, calyces pubescent, pendulous, which as well as the corollas are smooth." Shrubby, nine feet high, branching, with a reticulate bark, and white villosa buds; leaves roundish, half an inch long; flowers three or four, terminal, pendulous; calyces smooth, with short teeth; branches two, minute; corollas yellow; style protruding. 14. A. *hybride*,. purpurea A. "Leaves facieOed, filiform, rigid, spiny, flaky, flowers lateral, sessile, solitary, corollas villoso." This shrub differs much from the other species by its leaves resembling filky white spines. 15. A. *glanduleto, leaves facieOed, linear, pub-".

19. A. *pygmaeus*, leaves facieOed, fuscous, rather hairy; calyces half-shaped, the length of the corolla, solitary." A shrub much branched, with small pubescent warts where the leaves fall off; leaves pointed, thinly scattered with hairs; flowers solitary, fes-

20. A. *ferrica*, fuscous A. "Leaves facieOed, lanceo-

21. A. *acutiflora*, hoary A. "Leaves facieOed, pubescent, tomentoOe, fuscous, flowers lateral; branches pubescent. An erect, fuscous, hoary shrub, with alternate branches; leaves fuscous; flowers fuscous, at the sides of the branches; calyx bell-shaped, with pubescent teeth, shorter than the body of it; branches two, short, fuscous; corolla yellow; banner hoary. 22. A. *heterophylla*, various-leaved A. "Leaves of the branches facieOed, of the branchlets ternate, linear, hairy, spikel terminal; calyx and corolla villoso." Lower leaves in bunches, upper, ternate; spikes long, flowers yellow. This, and all the foregoing species, are natives of the Cape of Good Hope. 23. A. *indica*, small-flowered A. Phuk. Abru. 215. t. 201. fig. 2. (called Lotus, &c.) "Leaves quinata, fuscous; peduncle one-flowered." A fuscous shrub with alternate branches: leaves alternate; leaves obovate, obtus, blunt, smooth, broader towards the end; peduncles axillary, much longer than the leaves, but shorter than the ligumes; flowers of a pale red colour, which appear in May. A native of the East Indies, and in 1750, cultivated by Miller. 24. A. *cortic*, evergreen A. "Leaves trinse, wedge-shaped, smooth, lateral ones short; stipules obscure, flowers headed." About four feet high, with very flexible branches; leaves
leaves many, small, narrow, oblong, fleshy, evergreen, reflex at the edge, with a hard point, sometimes curled at the base; peduncles axillary; flowers of a pleasant smell, in two rows, yellow, very small; legume small, yellowish, containing a single round compressed flowering seed. A native of the Cape. 25. A. quinquefolia, five-leaved A. Pluk. Alm. 128. t. 273, f. 4. "Leaves in five, fertile; peduncles spiked." The leaflets are lanceolate, peltiled; a little hairy, mucronate; peduncles many times longer than the leaves, raceme-spiked; corollas tomentose. A native of the Cape. 26. A. tridactyla, three-toothed A. Leaves trine lanceolate, smooth; stipules three-toothed, mucronate, flowers headed." A native of the cape of Good Hops. 27. A. pilosa, hairy A. "Leaves in threes, linear villose; heads terminal, very hairy; corollas pubescent." Stems shrubby simple, a little hairy; leaves spreading, fleshy, acute, fimbriate; head of flowers protected by bracts and calyces, which have white hairs. A native of the Cape. 28. A. anthyllides. "Leaves trine lanceolate, equal subpubescent; stipules none, heads terminal." This shrub has a hirsute stem; the leaves are fleshy, rather fleshy, the upper ones somewhat hairy; heads solitary, fleshy, oblong; three bracts under each calyx. It has the appearance of a lotus or antyhyllus. Cape. 29. A. brevifolia, short A. "Leaves tern linear, villosi; flowers in bunches of five; calyx woody; flowers prostrate round. Sun fubulate, decumbent, round, fleshy, pubescent; branches alternate; leaves loose, on very short pedicels; flowers terminal, fleshy, no bracts; corolla smooth, yellow. Cape. 30. A. argentea, silver A. cytius, &c. Pluk. Mant. 63. t. 345, f. 2. "Leaves trine linear silky; stipules fimbriate much mucronate; flowers scattered tomentose." shrubby, four feet high, flowers sometimes in spikes, purple, downy. Cultivated by Miller in 1759. A native of the Cape. 31. A. callosa, callous A. Pluk. Mant. 63. t. 345, f. 4. "Leaves trine fimbriate equal; stipules roundish, callous; flowers fleshy, smooth." An underbush, having the branches covered with round calyces, occasioned by the falling of leaves, which are fleshy, with a calous base like those of juniper; spikes loose; brachis one-leaved; flowers yellow, smooth. Cape. 32. A. orientalis, Levant A. "Leaves ternate, lanceolate, pubescent; flowers in bunches of five; calyces subulate, hairs erectile, angular. Stems a foot high; leaves fleshy, resembling those of flix; corolla yellow, the size of those of laburnum; stamens connate. Found in the Levant by Tournefort. 33. A. macrostyla. "Leaves tern, polishes, branches acuminate; flowers in racemes. Stem smooth; branches remote, tapering to a point; leaves lanceolate, on short peduncles; racemes terminate, erec, on very short pedicels. Cape. 34. A. pinata, pineate-leaved A. "Leaves pineate-quinque-obtuse; peduncles headed;" leaflets five, close, a little hairy, tomentose underneath, on short peduncles; peduncle longer than the leves; corollas rather tomentose. It resembles A. quinqufolius, n. 25. Cape. 35. A. pelucnulata, small-leaved A. L. Herit. Ang. t. 26. "Leaves fimbriated, fimbriate, smooth; peduncles filiform, twice the length of the leaf." Found at the Cape by Maffon, and introduced into the Kew garden in 1775. It flowers in June. 36. A. candicans, fair A. "Leaves trine and fimbriated, filiform, silky; flowers sublateral, none naked" This was also found at the Cape by Maffon and introduced in 1744. 37. A. arborea, tree A. Lour. Cuchinque. 43. "Leaves pineate-quinque; racemes terminating." This is a middle-sized tree with a straight trunk, and weak reclining branches; leaves smooth, entire, fimbriate; flowers white, small, banner obcordate, broadish, ascending; wings oblong, equal to the banner; stamens all connate. Vol. 111.

Propagation and Culture. Few of these shrubs have hitherto been cultivated in Europe. They are to be propagated by seeds, which must be obtained from the country where they grow spontaneously, and should be sown in pots filled with light earth as soon as they arrive: if this happen in the autumn, the pots should be plunged into an old tan-bed whole heat is spent, when they may remain till spring, when they should be removed into a temperate hot-bed, which will bring up the plants. But when the seeds arrive in the spring, the pots in which the seeds are found should be then plunged into a moderate hot-bed; and in warm weather the glass must be flaked during the middle of the day, and the plants frequently refreshed with water. Thos. seeds that are sown in the spring, seldom grow the same year; therefore, in the autumn, the pots should be put into an old tan-bed as above directed, and the following spring put into a hot-bed. When the plants become strong enough to remove, they should each be planted in a separate small pot filled with light earth and plunged into a moderate hot-bed to promote their rooting again, and as soon as they are established in the pots, they should gradually be exposed to the open air, which they are to be removed into the summer, and remain in a shaded situation till autumn, when they must be placed in the green-houses, allowing them very little water during the winter. See Marty's Miller's Diet.

Aspalathus. See Robinia and Spartium.

Aspalathus Ebenus. See Americanum.

Aspalax, in Zoology, an animal mentioned by Aristotle, as being blind. The Romans and some moderns translating the term aspalax, mole, and knowing that this animal is not blind, have thought themselves warranted in denying the affirmtion of Aristotle. Olivier, however, has not long since brought from the Levant an animal actually blind, with its skin not so much as pierced in the place of the eyes. This animal lives under ground, and has all the characters ascribed by Aristotle to the aspalax. It is known to zoologists under the name of mus typhlus, or blind.

Aspalax, a species of Mus, called by Pennant and later English naturalists the Donarian rat; Laxmann names it Mus myosaphalus; and Pallis, Schreber, Gimelin, &c. Specifically describe it as having a short tail, uncinated and wedged fore-teeth, no ears, and claws of the fore-feet elongated. It is a native of the Altea mountains, and of the country beyond the lake Bajkal; like other subterranean or ground rats, it burrows with its snout and feet, raises numerous hillocks of earth in its progress, and feeds on bulbous roots. In respect of size, it varies considerably, being from five to eight inches and a half or more in length. Dr. Shaw observes that this species in form and manners of life agrees with the mus typhlus, or blind rat; but is in general of a smaller size and of a yellowish ash colour, and in some specimens a whitish line or longitudinal streak appears on the top of the head; the upper fore-teeth are naked, but the lower are covered with a movable lip; there is no appearance of external ears, and the eyes are extremely small and deeply seated; the head is flat and blunt; the body short and somewhat depressed; the limbs very strong, especially the fore-paws, the feet of which are large, naked, and well adapted for burrowing into the ground, having five toes, the three middle of which are furnished with long and strong fleshy curved claws; the hind feet are also naked, and have five toes with small claws; the tail is very short. Gen Zool.

Aspalucua, in Ancient Geography, a valley of the Pyrenees, now the valley of Afe, in which was the Gaba- rus, or Gave.
ASPARAGUS, a forest of Asia Minor, in the Tross, being a part of the forest of Ida. Strabo.

ASPARAGUS, in Geography, a town of Germany, in the archduchy of Austria, fifteen miles south of Eisen- furt.

ASPARAGI, in Botany, a species of CROSOMELA (Linn.), with a red thorax marked with two spots of black; wing-cases yellow, with a cruciform mark, and four spots of black. Geoffroy calls it le criocere porte croix de Pal-perge; it is attelabus asparagi of Scopoli; lemma asparagi of Fab. Ent. Syll. Supp.; cryptopetalus asparagi of Gmelin; and achemia asparagi of Marth. Ent. Brit. This Mitchelli- nous intruder into the kitchen garden, is but too well known by its depredations in the larva state upon the beds of aspara- gus; it is a little grub of a blackish-brown colour, that feeds exclusively on these plants; and, if neglected, will in the course of a few days leave nothing but the naked stalks of the asparagus remaining in those beds where they can once take up their residence. Donov. Brit. Inf. &c.

ASPARAGUS, in Botany (Astragaus, a young shoot, before its leaves unfold). Linn. g. 434. Schreb. 573. Gern. 16. Jull. 47. Chfis, alexandria monogynus. Nat. Ord. Sec. Gen. Char. Col. rose. Cor. petals fix, coloriing by the claws, oblong, erected into a tube, three alternately interior, permanent. Stam. filaments fix, fili- form, inserted into the petals, erect, shorter than the cor-olla; anthers roundish. Pfl. germ. turbinate, three cor-nered; style very short; stigma, a prominent point. Per. berry globular, umbilicated with a point, three-celled. Seed, two, round, angular on the inside, smooth. Olf. According to Dr. Smith, there are three stigmata; the flower appears as if it were monopetalous.

Species, 1. A. officinalis, common asparagus or sperage, Hud. 44. W. 340. Smith Brit. 359. Eng. Bot. 339. Flor. Din. 805. "Stem herbaceous, round, erect, leaves falcate; stipules uniform, subfoliculiferous." It grows wild in maritime places in the south of England, abundantly on the pebbly beach opposite the ferry going from Weymouth to Portland island. A variety 2. viz. A. maritimus caffrefo folio, (Dill. in Ray's Synop.) has been found in Anglesea. Root perennial, creeping, with very long, thick, simple fibres; stem erect, occasionally procumbent, round, simple, and bearing alternate scales (or stipules without leaves below) in the upper part, branching in a panicked alternate manner; leaves in tufts, very narrow, and brilly, but flexible; stip- pules solitary, membranous, triangular, acute, the upper ones ovate and jagged; flowers from the axilla of the branches on capillary simple stalks, drooping, white, none of the segments indexed, in some the flaminis, in others the pistillum occasionally abortive; style deeply three-cleft; berry red. It flowers in August. The above is a description of the plant in its wild state, in which its stigmas are usually about the size of a goat's quill, yet this is now well known to be the origin of our luxuriant garden aspara- gus, for the cultivation of which ample instructions are forthcoming. 2. A. declinatus, long-leaved A. Stem un- armed, round; branches declined; leaves falcate. This resembles the common iori, but it is higher, has more and much longer leaves; stipules solitary, lanceolate-fibuliferous, with a membraneous point at the base downwards; leaves seven or ten in a bunch, siphon, spreading. A native of the Cape. Introduced in 1787, by Mr. Matson. 3. A. falcatus, fiddle-leaved A. Burn. Flor. Zeyl. 36. t. 13. f. 2. "Prickles solitary, reverted; branches round; leaves enli- form, falcate." A native of Ceylon. 4. A. retrofractus, arch-leaved A. "Prickles solitary, branches round, reflected, and retrofracte; leaves falcate, facicide." Its branches are round dichotomous, parted at the divisions with a minute redding prick. The stipules are shrilly, crooked, irregular, eight or ten feet high; leaves long, narrow, in clusters like those of the iori. A native of the Cape. Cultivated by Miller in 1759. The leaves produce their verdure all the year. 5. A. ethipicus. "Prickles solitary, reverted; branches angular; leaves lanceolate-linear." This is nearly allied to A. falcatus, but the leaves are smaller, and about seven in a bunch. The stipules put forth a reverted spine. A native of the Cape. 6. A. aspicu- ticus, slender-tailed A. "Prickles solitary; stem erect; branches filiform; leaves facicided, facicide." It sends up many weak shoots in clusters, and armed with sharp spines at the sides and ends of the shoots; leaves in small clusters, and continuing green all the year. 7. A. albus, white A. "Prickles solitary; branches angular, flexufoe; leaves facicided, triquetrous, awnles, deciduous." Stems shrubby, covered with white bark, armed with thorns, three or four feet high, furnished with many branches, bearing short narrow leaves. These continue green all the winter, if screened from the frost. A native of Spain and Portugal; cultivated here in 1640. 8. A. acutifolius, acute-leaved A. "Stem unarmd, angular, shurby; leaves needle-shaped; rather rigid, perennial, mucronate, equal." It has white, crooked, shrubry stalks, four or five feet high, without spines; leaves like those of larch, but short, and end in prickles. It resembles A. aphyllus, from which it differs, in usually having seven leaves together, which are much smaller. A native of Spain and the Levant. Cultivated by Miller in 1759. 9. A. borridus, thorny A. "Leafles, shrubby, pentagonal; prickles four-cornered, compressed, flattened." The spines are about the length of the finger. A native of Spain. 10. A. ophillus, prickly A. "Stem unarmd, angular, shrubby; leaves subulate, liriated, unequal, diverging. Stems weak, irregular, furnished with stiff, short spines, instead of leaves; flowers small, of an herbaceous colour; berries very large, and black when ripe. A native of the South of Europe. Cultivated here in 1640. 11. A. capenfis, cape A. "Spines in fours; branches aggregate, round; leaves falcate." Pluk. Alm. t. 78. f. 3. Root tuberous; frums fruticoso, filiform, flexufoe; branchlets from the axilla of the spines, filiform, loofe, unarmed, deciduous; leaflets facicided, acute, short. A native of the Cape. Cultivated in the royal garden Hamps- ton-court, in 1691. 12. A. farmentofus, linear-leaved A. "Leaves solitary, linear-lanceolate; item flexufoe; prickles recurved." It rises five or six feet high; and its shoots are so closely beft with short crooked spines that it is diffi- cult to touch the branches. The roots, which are long and fuliform, are cates with broth or milk by the inhabi- tants of Ceylon, who are very fond of them. Cultivated in 1714, by the duchefs of Beaufort. 13. A. verticillaris, whort-leaved A. "Leaves verticillate." Found by Tourn- fort in the Levant.

ASPARAGUS, in Gardening, comprehends one of the most valuable eculent vegetables of the kitchen garden; it has erect, herbaceous stalks, three or four feet in height, and very fine brilly leaves; it is a perennial fibrous rooted vegetable, the roots being of many years duration, but the tops or stalks annual. The plants being raised from seed, after having acquired a period of three or four years growth, produce proper fixed asparagus, of which the fame roots furnish an annual supply for many years, continuing to rise in perfection for fix or eight weeks in the summer season, the
the shoots afterwards run up to stalks and flowers, and perfect seeds in autumn.

But besides the crop raised in the summer season, it may also be obtained in perfection during the winter, and early in the spring, by the aid of hot-beds, in the manner explained below.

Propagation of the Plants. It is observed by the authors of the Universal Gardener, that the propagation of this plant is by seed only, which may be easily obtained from seed-shops. It should be sown in February, or any time in March, in a four feet wide bed of rich earth, either broad cast on the surface, and directly raked in, or in drills long-ways six inches aunder, the ground being afterwards raked.

In six weeks or thereabouts, the plants will generally appear; they should be kept clean from weeds all the summer, and in winter a little short flake litter spread on the ground to defend the crowns of the roots from frosts; and in the spring following they will be fit for transplanting where they are finally to remain, and in two or three years afterwards, as has been just observed, they will produce asparagus fit to gather.

Asparagus is always three years at least from the time of sowing the seed before the plants obtain strength enough to produce shoots of due size for the table; that is, one year in the feed-bed, and two after being transplanted, though it is sometimes three or four years after planting before they produce good full-sized shoots. But the same bed or plantation will continue producing good asparagus ten or twelve years, and even endure fifteen or twenty years; however, at that age the shoots are generally small, and the whole annual produce inconsiderable; a new plantation should therefore be made every eight, ten, or twelve years, as may be judged necessary. When new plantations of asparagus are required to be raised in the quickest manner for use, it should be done by purchasing ready-raised year-old plants of the nurseriesmen or kitchen gardeners, as in this way a year may be gained.

The belt season of the year to make a plantation of these plants is in March, in common light ground, or at the latest, the first or second week in April; but in cold moist soils, from about the twentieth of March to the fifteenth of April.

In regard to soil and situation, the plants succeed tolerably well in any that is light and mellow, and that is sufficiently rich; but it is eligible to allow them a spot that is rich and light; in one of the open quarters of the garden, that is exposed to the free air and full sun, as this is of much importance. Dung must be added six or eight inches thick at least; the ground is then to be trenched one or two fads deep, as may be necessary, burying the dung regularly in each trench, observing that where the trench is but one fadpe depth, the dung be buried well in the bottom; but if two fadspe depth, betwixt the first and second pit, or about ten or twelve inches below the surface. Where the trenching is performed in winter, or any considerable time before the planting season, it is proper to throw the ground into ridges to meliorate and improve by the weather into better preparation for planting, as well as for the benefit of the young plants. When the time of planting arrives, it is to be levelled down, which will be a further improvement. See Trenching and Ridging of Ground.

The space of ground necessary to plant for private use is generally from about four or five to twenty rods, according to the extent of the family; and the proper quantity of plants to a rod, exclusive of the alley, is about 250; one year old plants are to be preferred to such as are older; as those of that age will establish themselves sooner and more effectually than older roots. The plants at the time of being put into the beds, consisting usually of only roots, are at the proper time to be taken up from the feed-bed with a dung-fork as entirely as possible, and the strength sorted out for use, but not trimmed, only such parts as are broken or bruised being cut off.

In planting, they are to be placed in rows a foot asunder, and formed into beds, each bed to consist of four rows ranging lengthways of them, and planted in drills, or in small narrow trenches, as explained below, allowing three feet and a half interval between every four rows, two feet of which to be afterwards allotted for an alley between the beds, and the rest to be annexed to the beds, which, as well as the alleys, must be regularly laid out in their proper dimensions, four feet and a half for the beds, and two feet for each alley between bed and bed. Or they may be at first marked out and formed into beds and alleys regularly and of their respective dimensions; the beds four feet and a half, and the alleys trodden out between the different beds two feet wide; then four spaces a foot asunder marked out for four rows lengthways of each bed, the two outside rows of each nine inches from the edge; stretch a line tight along the length of the bed in the first outside row, and with the spade held in an erect position, the back being towards the line, cut out a small nest trench along close to the line about six inches deep, forming the side next the line upright, turning out the earth evenly to lie close along the edge of the trench, ready to earth in the roots as planted; this being done, proceed to planting the row, placing the plants in the trench close against the upright side ten or twelve inches asunder, with the crowns upright about two inches below the surface, spreading the roots both ways, and drawing a little earth up to those of each plant as they are put in, just so as to fix them in their places till the whole of the row is planted; then directly rake the excavated earth into the trench over the roots and crowns of the plants evenly; which done move the line a foot further for the next row, and cut out another trench as above, and plant it in the same manner, directly earthing over the plants as in the first row; and thus proceeding regularly with the rest till the whole is completed. Having finished the planting in either of the above methods, the bed and alleys may either be laid out now regularly, or deferred until the winter and spring drilling, though where the beds, &c. are formed previous to the planting, it may be eligible to line them nectly in their proper dimensions as soon as planted, making the edges of the beds full and straight, and the alleys level and even.

In the other method, either forming the beds and alleys now or afterwards, as hinted above; observing that the wide intervals of three feet and an half between the beds, two feet only are to be allowed for alleys, the other eighteen inches must be added to the beds, which will make each bed four feet and a half wide, nine inches on each side wider than the outside rows; and noting that in either method, if the beds, &c. are formed as soon as planted, the alleys at this time are only to be trodden out gently the proper width, without calling out any of the earth upon the beds, so as to flatten in the alleys, and lightly to rake the bed even, drawing off any large loones and lumpy clods, so as to leave a smooth surface.

In performing the above, if you have occasion to make the moat of every part of the ground, a thin crop of onions may be sown the first year on the same plat as soon as the asparagus is planted; but in this case, sow the seed moderately thin, raking it in regularly with a light and even hand, so as not to displace any of the asparagus plants.

The asparagus being planted in this manner, it requires the following culture.—The shoots mostly appear above

N 2
ground the beginning of May, commonly not much bigger than straws; all such must be permitted to run wholly to stalk. During summer, they must be kept clean from weeds by small hoeing or hand weeding them three or four times in the course of that season; and if there be a crop of onions, thin them in the usual way, cutting out all such as grow immediately close about the asparagus plants. In October, when the asparagus stalks decay, cut them down, and clear off all weeds from the beds into the alleys, and then dig the alleys two feet wide, burying the weeds therein, and spread some of the earth over the beds. See Winter Dressing.

This is all that is necessary to be done until March, at which time the beds should be deeply hoed, and raked smooth, permitting all the shoots to run as in the first summer; and in October, cut down the decayed haulm as before, and land up the beds; in the spring following, being the second after planting, slightly fork-dig the beds, and rake them level. See Spring Dressing. In this spring, as the shoots rife of some tolerable substance, begin the first gathering of the largest plants in the first fortnight, but do not practise any general gathering till the third year. See Gathering Produce.

Winter Dressing, or landing up the Beds.—From about the middle of October to the latter end of November, is the time to give the asparagus beds their winter dressing. This consists in cutting down the decayed stalks of the plants annually at the above time, and clearing the bed from weeds, digging the alleys, and spreading some of the earth over the top of the beds, which is called landing up the beds. It is done in the following manner. —The decayed stalks, or haulm, are cut down with a knife close or within an inch or two of the ground; then with a sharp hoe cut up all weeds, drawing them off at the same time into the alleys to be buried; after this, proceed to line out the alleys, stretching the line along the edges of the beds about nine inches from each outward row of plants, the flakes that are to be placed at the corners of the beds, or otherwise the thumps of the flakes, will be a guide; then with a spade chop the ground along by the direction of the line, by which you will form each bed four feet wide, and the alleys two feet. The alleys are then to be dug one spade deep, and a good portion of the earth spread over each bed two or three inches thick. As soon proceeded in digging, let the weeds drawn off the beds be trimmed into the bottom, and buried a due depth, observing to land the beds all a regular thickness, so as to make them about six or eight inches higher than the level of the alleys, forming the edge of each bed full and straight. This work must be repeated every autumn. It may be supposed by some that in annual landing of the beds, they may in several years be considerably raised; but by the spring forking and raking, together with the repeated hoeings and clearing off weeds in summer, and at the time of preparing for landing up in autumn, a considerable part of the earth is annually drawn off again into the alleys.

After thus performing the winter dressing of the beds, a row or two of cabbage plants may be planted in each alley, or a piece of shelter during winter, by which they will be forwarded for early spring coleworts; or a row of mazany dwarf or other herbs may be planted in November or December in the warmest side of each alley, for an early crop; or occasionally, where ground is scarce, some of the bed might be occupied during winter by planting a crop of cabbage lettuce on it for spring use, which being all gathered, or transplanted into other places, by the beginning of April, are supposed to do little harm. It must, however, be done with great care, and such crops not suffered to remain long, otherwise they may injure the asparagus plants in a high degree.

Spring Dressing the Beds.—The spring dressing consists in fork digging the beds annually at that season to a moderate depth, to loosen the soil, that the bulbs may freely advance and swell to their due size. The time for performing this work is any time in March, but not later than the first or second week in April, because many of the beds will then be formed; and, in forward seasons, begin to advance in growth. This work is usually performed with a short flat three-pronged fork. In the first spring dressing after planting, it is proper to loosen the surface only with a hoe, or two or three inches deep, and then rake the beds smooth. But the general spring dressing is to be annually performed by fork-digging all such beds as have been planted more than one year, three or four inches deep, with the asparagus fork; being careful to loosen all the earth as deep as the surface of the roots, having regard however not to wound the crowns of them; and afterwards all the beds should be neatly raked, to break clods, clear off stones, and form a level smooth surface, drawing off all rough earth, &c., into the alleys, which afterwards also rake up in a neat order.

Manuring the Beds.—These should be enriched with an addition of good rotten dung, once every two or three years at furthest, the benefit of which will be evident in the quality of the roots; as well as in the size and quality of the produce; the season of applying this manure is at the time of winter dressing or landing up the beds. The dung for this purpose should be perfectly well rotted, as the dung of old cucumber and melon beds, or any other of similar quality, which should be applied after the stalks and weeds are cleared off; spread two or three inches thick over the surface of each bed, and a double portion in the alleys; the beds being then slightly fork-digged to bury it; after this dig the alleys in the usual way, and spread a portion of the earth evenly over the beds. In this way the winter rains may wash the enriching quality of the manure into the beds and the roots, from the vegetation of the spring.

Gathering Produce.—As asparagus plants sometimes, in very rich ground, afford tolerably large buds the second year, here and there, one of the largest that happens to appear the first week or fortnight may be cut, afterwards permitting the whole to run to stalk; but in the third year, a more general gathering may be practised, and continue a month or six weeks; and in the fourth year the general produce will rise in its utmost perfection. Then, and every succeeding year, gather all the buds arising from every plant during the season of cutting. The proper size of the asparagus for use, is when the shoots are about two or three inches above the surface of the earth, while the buds remain compact and plump. The principal season of cutting them, is from the latter end of April, or beginning of May, according to the forwardness of the season, till the middle or latter end of June. They might, however, be obtained a month or two longer in the season, by continuing to cut all the buds, according as they attain proper size; but this would be a very wrong practice, as the roots would thereby continue filling up a fresh supply, till they in a manner exhaust their vegetable food, as would be apparent by the inconconsiderability of the future crop, and short duration of the plants. The principal gatherings should therefore be terminated generally towards the latter end of June, especially as by that time there will be plenty of young peas to be used as a substitute in its place at table.

In cutting the asparagus for use, it is necessary to be furnished with a straight narrow-pointed knife, the blade fix or eight inches long, toothed on the edge like a saw, which is
to be slipped down close to each separate bud, in order to cut it off planting, three or four inches within the ground; being careful not to injure any of the young buds rising in succession, as there are generally several from the same root, advancing in different stages of growth.

Forcing Asparagus.—As asparagus is frequently required in winter, and early in spring, another method must be practised for obtaining it in its season. This is by means of planting the roots in substantial hot-beds, covered with frames and glades. When it is intended to have a constant succession of asparagus during the winter and spring, a new hot-bed must be made, and planted with fresh plants every time or four weeks, as these roots when forced in hot-beds do not continue to yield any tolerable produce longer than that period of time, when they will in a manner be quite exhausted, and are not fit for that or any other purpose afterwards; therefore, for this purpose, a fresh quantity of plants must be kept in readiness for every new hot-bed. These are raised in the natural ground to a proper age; they must be three or four years old, the plants being raised from seed, as directed for the natural ground asparagus, and when they are one year old, transplanted into beds of rich earth, as directed also for the natural plantations, in rows a foot or more; but they need not be more than nine inches distant in each row, forming them in beds of six rows each, with only two feet alleys, just to go in to clean off weeds, &c. as the beds need not be laid up in winter, as in the natural asparagus; but when the plants have had two summers' growth, they will, in good ground, be fit for forcing, though they are in greater perfection if permitted to stand three years. During the time they remain in the natural ground, none, or very few, buds should be gathered, the whole being permitted to run to a flower each summer. It is also necessary, when intended to force asparagus annually, that some seed should be sown every spring, and a due quantity of plants transplanted as before directed, so as to have three different pieces of ground always employed at the same time with plants for the above purpose; that is, one piece with seedlings in the feed-beds, the other two with transplanted plants, one to be of a year's growth before the other; by which practice, after the first five years, an annual succession of plants fit for forcing may be procured. But where it is intended to watch the flowering of the plants in this manner, they may be furnished by most of the kitchen gardeners in the neighbourhood of great towns, when raised to proper growth for this purpose, they commonly fall by measurement of the ground they grow upon, generally fall from six to ten fillings per rod, according to the age and size of the plants, and fullness of the crop.

Mr. Nichol, in his Forcing Gardener, observes, that plants for this use should not be older than seven or eight years, nor younger than four years, and that they should be covered with litter or straw, in order to have access to them during frosts. The necessary quantity of plants for hot-beds is (he says) considerable, since about as many as grow upon three rods of ground, are requisite for a bed intended for a common three-light garden frame. The common allowance of the London gardeners is about one rod to a light; for the plants are to be placed close as they can possibly stand to one another, to the amount of five, six, or seven hundred, or more, according to their size, in a three-light frame, otherwise a bed would not supply a quantity adequate to the expense and trouble incurred in the culture of these plants in hot-beds; for, from a bed of the above dimensions, we commonly expect about three hundred large buds or ware, besides five or six, weekly, and in the whole, about eight or nine hundred good asparagus, and near as many small ones, in three weeks, in which period of time, the roots will have exhausted their strength, and produce very little more. Therefore, in raising or procuring plants for the above purporses, the quantity must be proportioned to the number of lights you intend working, and the succession of asparagus required. The reason for beginning the above work, is according to the time the asparagus is required for use; as for instance, if you would have good asparagus at Ch. times, it is proper to make the hot-bed in the first or second week in November, and so on in proportion to any other time in winter or spring it is desired to have it fit to gather. The rule is this: if a constant succession is required from about Christmas till the time when the natural asparagus come in, a new hot-bed should be made every three weeks or a month from the beginning of November until that of March; but some begin about the latter end of September, in order to obtain asparagus about the second week in November. The proper materials for this form of hot-bed are, according to the authors of the Dictionary of Gardening, a sufficient quantity of horse stable dung, fresh and full of heat; for one or more three-light frames, two feet and an half or a yard high; also some to line the sides of the bed, when the heat declines, a quantity of good kitchen garden earth, and one or two three-light garden frames to place over the beds, and some large garden mats, to cover occasionally in nights and bad weather; the dung being previously prepared as directed under the article Hot-beds. The bed situations for the hot-beds are some of the warmest and most sheltered compartments of the kitchen garden near the melon or cucumber ground if there be room; though the London gardeners, when they make a considerable extent of asparagus hot-beds, often form them in or near some of the large quarters of the kitchen ground, where the soil is rich and light, for the convenience of having plenty of good proper earth at hand for earthing the beds, banking up the outside plants, and moulding at top, &c. The exposure should be open to the full southerly sun, and well defended from the northerly winds. The beds may be made either wholly on level ground, or occasionally in a hollow trench, four or five feet wide and fix or eight inches deep, or if intended to make them in any of the quarters of the kitchen ground, a trench might be formed as above, in which to make the beds for the sake of the earth being laid ready for earthing the beds and plants, and to save the trouble of bringing it from a distance, especially for beds of considerable length; but otherwise they may be made, as has been just seen, entirely on even ground in the most convenient situations. As to the general dimensions of the beds, they must be in proportion to the width and length of the intended frames, or rather a little wider and longer, to allow from three or four to five or six inches clear on each side and end, whereon to back up some earth against the outside roots, &c. and they should be about a yard high, earthed at top about six inches thick for the exception of the plants, before the frames, are put on, keeping them within the compass of them upright and as close as they can stand, as directed below. The clear space from a few inches on each outside end, is as suggested above, to receive a small bank of earth against the outside roots, both to defend them from the weather, and for the support of the frame; the latter of which, on account of the first violent heat, is not put on till some time after planting the roots; these, as soon as planted and banked up on the outsides, are earthed over the crowns of the plants an inch deep, which should be increased to five or six when the beds appear through the first earthing, at which time, as the heat of the bed will be moderate, the frame and glades should be placed on. See General Culture.
The author of the Scotch Forcing Gardener, however, suggests that the forcing of asparagus in flued pits, is by far the most eligible method, as such pits may answer several other purposes; besides the grass is of a much better colour and higher flavour than that produced on a dung hot-bed. Such a pit is represented at fig. 1, in Plate 1. Gardening, will completely answer the intentions of the cultivator. As it frequently occurs in large families, where much company is kept, that this elegant is wanted in a hurry, the convenience of a pit will be found to be a great relief in this respect; as it is much easier (by aid of flies) to forward or arrest the growth of the plants here, than in the common hot-bed; on the one hand, if the plants are advancing too rapidly, you are, it is observed, under the necessity of cooling the bed in a certain degree; and on the other, if they are not advancing so fast as you could wish, you are under the necessity of applying linings, which is attended with trouble and loss of time. The author says, that a pit twenty-five or thirty feet long, and six wide, and which one fire can perfectly command, is sufficient to force asparagus to serve a large family from November to May, in a constant and regular succession; after which it may be advantageously employed in raising a late crop of melons or cucumbers, or in starting young pine-apple plants, &c. The tilling and furrowing up of bed, even where it is most valuable, is unnecessary, because the plants of asparagus, French beans, fallacks, &c. at an early season, from building so useful a compartment in the forcing garden. If, continues he, a scrupulous attention is paid to the design in general, particularly to the construction of the fire-places and flues, it will give more satisfaction to the gardener than any other hot-bed whatever, and in the end be a paying to the proprietor. In the construction of this kind of pit, as is shown by the plate, the first course of the flue runs along the front, the bottom of which is about the ground level, and as the outer wall of the flue is only a brick in bed, it is obvious that early cylinder, carrots, lettuces, radishes, cauliflowers, &c. &c. soon on a well-prepared border about two feet broad, immediately adjoining the breach of the pit, would reap infinite advantage from the flue. At the time of any operation within the pit, a board or plank, supported by bricks, &c. would defend the border from injury. The pit is about four feet in the back and three in the front, deeper than the bottom of the flues; which great depth is made on the presumption that it may be frequently used for pine-apple plants; but where it is used for asparagus alone, half the depth would be sufficient. It is immaterial whether the pit is entirely filled with tan or not; the author frequently used three-fourths of flable dung, prepared in the same manner as for a hot-bed, with equal lucers; but has always found that dung is worse to manage than the tan, as it is more liable to heat violently; besides, from the nature of the building, there is not a possibility of drawing off the rank heat, as in a hot-bed; for which reason, if dung is to be used, it ought to be sweated in a more careful manner. It is added, that a very small degree of bottom heat is sufficient for the purpose; and that if the pit has been previously employed with young pines, it will require no preparation whatever for asparagus roots, excepting to level and put a few inches of very rotten tan upon the surface. But if melons were the last thing the pit produced, it will be necessary to fill up the bed about two feet deep, and add a little new tan or dung; then level the surface with old rotten tan, as before. In either case the surface should be levelled in a flowing manner to the sun, about six inches above the bottom of the flues, allowing so much for the tan settling; the roots are then to be placed in and covered, as directed for the common hot-bed. If the pits are from twenty to thirty feet long, one half will be sufficient for a time; and, to keep a constant succession, the other half may be filled in about fifteen or twenty days, which will begin to come up before the first is all used; after which, once a month or six weeks, according to the size of the pit and conflagration of the family, may be sufficient, till it be fit for cutting in the open ground. It is recommended that no fires be made if the thermometer stands as high as forty-eight to fifty degrees; but, if necessary, covered with mats at night; also to admit plenty of air through the day, if the weather will permit. When it is necessary to make fires, it should be done with caution; a small one made in the evening will serve the whole night, and it will be unnecessary to make any in the morning, unless it be a great storm. He has, however, sometimes found it convenient to make a small fire in the morning, that he might have it in his power to admit air, and at the same time keep up a proper degree of heat. It is added, that warmth will here be required in a more plentiful degree than recommended for hot-beds; but due observation of the state of the tan and the health of the buds should always determine the warmth that may be necessary. In filling the front end of the pit a second time with fresh roots, it will be unnecessary to fill up the tan, &c. and perhaps it may be so even at the third filling; but by keeping a thermometer plunged in the bed, or watch-beds, you will be best enabled to judge; at all events, there will be no necessity for adding fresh materials, as he has always found that trenching the bed to the depth of two feet or so has answered the purpose for the whole season. If dung or oak leaves are used, the bed should be turfed; and at least a foot of very rotten tan or light mould laid on before the roots are placed in. This precaution is unnecessary, he says, when tan alone is used, in which case, however, not more than an eighth part of new tan ought to be trenched in.

Method of making the Beds, planting the Roots, and Culture. When the first method is followed in the situation and exposure above described, it is advised by the authors of the Universal Gardener, to mark out the place of the hot-bed, of the proper width and length proportionately to that of the intended frame or frames, whether one, two, or more; and if a trench is intended, to dig out the cavity, only one moderate spit deep, and the width as above; then wheel in the dung, and with it form the bed of the proper width and length, either on level ground or in a trench, as just directed, raking it regularly of the same dimensions, about a yard high, especially in winter; but for the final spring beds, two feet and a half depth of dung may be sufficient, working the whole upright and firm in the usual manner.

Mr. Nicol, however, recommends that a sufficient quantity of flable dung be shaken up to heat and sweeten, and that after it has lain six or eight days, it be turned over and shaken well up again, in which state it may lie for four or five days more; by which time it will be ready for building the bed; this must be done in the common way, to the height of four feet in the back and three in front, and about a foot larger than the frame all round; it is then to be well levelled, the whole covered with squares of turf, cut to as to join again exactly, which are to be laid the green side down, and smoothed well with the back of the spade; then place the frame thereon, which should be thirty inches deep in the back, and twenty in front, in which dry well-reduced old tan should be laid to the thickness of six or eight inches; which also level, and gently smooth with the spade. Where old tan cannot be procured, he advises a light sandy earth, with a fourth part of good vegetable mould. The bed will begin to heat in twenty-four hours, and must then have air admitted to pass off any steam that may arise, which will
will however in general be inconsiderable; the only reason of tiring the surface is to prevent the steam, which, if care-fully done, will have the desired effect. Yet, it sometimes happens, that there will be a little, especially if the dung did not undergo a proper fermentation; but until the grafts begin to appear, it is of no great consequence if there is a little steam in the frame, nor, provided there is not much steam, whether it has any air admitted or not. But, from the moment the buds begin to peep through, the greatest attention must be paid to prevent steam, which is sure to give the grafts disagreeable flavour and bad colour.

In order to prevent the grafts from drawing up weak, a large portion of air must be admitted every day, if the weather be not stormy; and a little air should be let in at night; while the bed has a rank heat in it, Fahrenheit's thermometer should not stand above 59° at any time, unless in sunshine, and then not above 62°. By the above rule, it will easily be seen, whether matting at night is necessary, and to what extent, but it must be attended to, till it entirely disappears.

When the beds are formed in the first method, they are advised in the Dictionary of Gardening to be directly earthed at top for the reception of the plants, with finely broken earth six inches thick, to the full width and length of the beds, the surface being raked level and smooth. Then imme-diately proceed to place the roots, for no time must be lost in asparagus hot-beds, in waiting for the temperature of the heat; previously to planting the roots, mark out on the surface of the beds the exact width and length of the frames, so as to have a clear space on each outside of a few inches width, to receive the banking of earth against the outside roots. As before mentioned; then begin at one end, and raise a small ridge of earth across-ways upon the surface, five or six inches high, against which lay the first row of roots, then having the roots which are not to be trimmed, place the first course close against the above ridge, and entirely upon the surface of the bed, with the crowns upright, and as close to one another as you can possibly place them, either wholly upon the top of the earth, or only draw a little to the lower ends of the roots, or insert the ends a little into the earth, though they are often planted without either drawing any earth about the fibres, or inserting them therein; and when one course or row is thus placed, lay another against the first in the same manner; and so proceed, laying them one against another, every way as you can possibly crowd them, from one end of the bed to another, being careful to place all the crowns of such an equal height, that the whole may form as it were a level surface, keeping the whole rather within the measure of the frame, for they will unavoidably swell out a little on each side. If more frames than one are intended for the same bed, then, at the termination of the length of each frame, raise a crofs ridge of earth, as at first, about six inches in height; so proceed laying the roots as before; and when all the roots are thus placed the whole length of the bed, directly bank up some earth on each side and end as above hinted, against the outside roots, raising it an inch higher than the crowns; then cover the crowns all over evenly with finely broken light earth an inch deep, which finishes the work until the buds appear; for the roots must not till then be earthed deeper, nor the frame and glasses placed upon the beds till the violent heat has subsided, because they would confine the burning heat, and occasion the bed to heat too vehemently to the destruction of the plants.

In forming the above beds, they sometimes, where necessary to the savoy of dung, are only made the exact width of the frame, so as to secure the outside roots; but for the support of the frame, raise a bank of earth quite from the ground, six inches broad at bottom, drawing it in gradually to the top, banking it close against the sides of the beds; and that of the outside roots, raising it an inch higher than the crowns at bottom of them, so earthing them all over the top an inch deep as before observed; which method of banking quite from the ground may also prove effectual in preferring the temperature of the bed, by defending the dung from driving rains, snow, and piercing winds. As soon as the beds are made and planted in either of the above methods, in order to judge of the temperature of the heat, it is proper to thrust some sharp-pointed sticks, two feet long, down between the roots into the dung of the bed, and by drawing thee up daily, and feeling the lower part, you will be able to judge of the degree of heat, whether too violent or weak, which is to be regulated accordingly.

The beds being made and planted, the roots will soon after be bound forth fresh fibres into the earth, and even in time into the very dung, and the buds of the asparagus begin to appear in a fortnight or three weeks; but till that period, as the heat will probably be very strong, the bed is to remain unframed and uncovered, except being occasionally defended at top; or at least, if the frames are placed on the beds, the glasses not fully put on, only using them occasionally, if very inclement weather should happen at that time, just to protect the bed and crowns of the plants from excessive wet or rigorous frosts; or the bed may be occasionally defended with long litter or garden mats from violent rains, snow, and severe frothy weather; observing, however, to use only occasional covering just to preserve the heat of the bed and the crowns of the plants till the buds begin to appear, and the heat becomes quite moderate, as at this period too much covering would increa-se the heat to a violent degree, and scourch or flame-scald the roots, which, in strong beds, must be particularly guarded against. The temperature of heat must therefore be every day examined by the trying-flick; and if it is found to be as yet too violent that you judge the roots are in danger of scorcheing, the remedy is to bore with a large raker-handle, &c. the fides of the bed quite through in several places, both in the dung, and betwixt the top of the dung and the earth, that the rank steam and burning quality may evaporate at the holes; at the same time the free air may have access, and in two or three days the bed will be reduced to a moderate temperature. On the other hand, it should likewise be observed, that if the bed in a week or two after being made does not heat kindly, or seems rather to decline, it may be proper to lay dry or warm stable-litter round the sides and over the top, which will forward and revive the heat more effectually. When the asparagus begin to appear, they are then to have their final earthing of four or five inches depth of additional mould all over the crowns of the roots, and the frame and glasses put on. At this period prepare some light, rich, finely-broken earth, sufficient to mould them the above depth; at the same time, in order to secure the outsides of the had final earthing, it is proper to form a sort of wreathing or em-pallement round the top of the edges of the bed four or five inches high, which is done either with a thick straw-band, or by raising the outside banking an additional four or five inches; either of which, as just observed, is neces-sary, not only to secure the sides and ends of the said final top covering of earth, but also to support the frames when finally placed on the beds.

The beds being now finally earthed, the frame, and the heat
heat become moderate, the glasse or lights are to be kept constantly upon the frame, which in the night should be covered with mats, or dry long litter, but must be uncovered every day, except in uncommonly severe weather; for it is of importance, when the asparagus shoots begin to advance, to admit much light and freedom, to promote a green colour in the tops of the buds; and as to the admission of fresh air, if the heat is moderate, the glasse need only be shoved a little open in fine days, especially if you require the plants to be drawn up quick; but by admitting a large portion of air, the buds rise faster, and will acquire a larger size and greener colour; on which consideration you may sometimes, in the spring-made beds, take the glasse entirely off a few hours in fine mild dry days, particularly when the heat of the bed is considerable at the first appearance of the buds after the bed is framed.

This is also the proper period to examine the temperature of heat in the beds. When they have been made about three weeks, if but small beds, the heat will probably begin to decline considerably, which should be renewed by a lining of hot dung applied to the sides, if this is not to be omitted, particularly when the buds begin to appear through the half covering of earth, if there seem occasion for it; though beds of more considerable length seldom require lining till after the first breaking, or gathering of the buds, then adding good linings, they will maintain the beds in the due temperature from fifteen to eighteen days longer, which is generally as long as the roots continue yielding any tolerable produce. Mr. Nicol has however remarked, that he has seldom found it necessary to line asparagus beds; yet that sometimes in a form it may be requisite. This, when necessary, should therefore be done with caution; and never more than one side of the beds at a time. Let the dung for this purpose, say he, be prepared in the same manner as for a bed at first; then cut, with a sharp blade or dung knife, the part you intend to line, perpendicularly by the side of the frame; reject the tan and slat, and use the rest along with the new dung, unless very much wasted; from twenty-four to thirty inches will be a sufficient breadth for the lining; raising it to about six inches above the bottom of the frame, and observing to tread it well towards the old dung, giving it a considerable slope on the outside, which naturally makes it lean that way. If the lining should raise too great a heat in the bed, or cause a smear, draw it off as directed above; and when it has done subduing, let it be turfed in the same way as the bed was. In respect to water, he says, he has frequently produced a whole crop of asparagus without either earth or water. This, however, is not always the case, nor is it definable; as if a little water is not required, the dung must be in too moist a state, and consequently too much noxious vapour must have attended the whole process. It will be advisable, however, to keep the beds, from the little fun there is, to be sparing in the use of that element at this season of the year.

The asparagus is mostly in a situation to be cut about five or six weeks after the planting of the beds, or when the plants are advanced five or six inches above the surface of the earth with which the beds are covered. In gathering the shoots in hot-beds, it is the best method to break them off as close to the bottom as possible, by thrusting the fingers and thumbs down into the beds.

Asparagus Draca. See Dracaena.
Asparagus Scandens. See Mediola.

Asparagus was also used, by the ancient Greeks, to express not only the young shoots of the plant of that name, but any other young sprouts of an eatable plant. The sprouts of the several kinds of cabbage were particularly expressed by this word, or sometimes by the compound term cram- afaragur.
Conjunction, and opposition, are the two extremes of the aspects; the first being the beginnings, and the second the highest or ultimate term.

The aspects are divided, with regard to their supposed influences, into benefic, malefic, and indifferent.

The quadrature aspect and opposition are reputed malefic, or unfriendly; triune and textile, benefic or friendly; and conjunction, an indifferent aspect.

To the five ancient aspects, the modern writers have added several more; as decile, containing the tenth part of a circle; tridecile, three-tenths; quintile, a fifth part of the circle; and biquintile, three-fifths, or two-fifths.—Kepler adds others, as he tells us, from meteorological observations; as the semi-textile, containing the twelfth part of the circle; and quindecile, containing five-twelths. Lastly, to the astrological physiognoemies we owe, albile, containing one-eighth; and virile, containing three-eighths.

The angle intercepted between two planets is the aspect of conjunction, if the two planets be on the same side of the interplanetary space, or if the one be behind and the other before the planet being considered. If the planets are on the same side of the interplanetary space, and the one be behind and the other before, the aspect is that of opposition.

The angles, or intervals, are reckoned on the secondary circles, or according to the longitudes of the planets; so that the aspects are the facts, whether a planet be in the ecliptic, or out of it.

The aspects are also divided into partile and platoe.

ASPECTS, Partile, are when the planets are just so many degrees distant, as is above expressed. These alone are the proper aspects.

ASPECTS, Platoe, are when the planets do not regard each other from those very degrees; but the one exceeds as much as the other falls short. So that the one does not seek its rays immediately on the body of the other, but only on its orb or sphere of light.

Aspect, Double, is used in painting, where a single figure is so contrived, as to represent two or more different objects, either by changing the position of the eye, or by means of angular glises.—Influences hereof, see under the articles Anamorphosis, Catoptric, Cistula, and Miroere.

Aspect, in Gardening, is used for what we otherwise call exposure.

Aspect, in Military Language, is applied to a country and to an army thus; a country is said to have a military aspect, when its general situation presents appropriate obstacles or facilities for an army's acting on the offensive or defensive. An army is said to hold a menacing aspect, when by advanced movements or positions it gives the opposing army reason for apprehending offensive operations. An army is said to have an imposing aspect, when it appears stronger than it really is; and this aspect is assumed for the purpose of deceiving an enemy, and serves as a kind of feint in war.

ASPEN-TREE, in Planting, a species of the poplar, having small roundish leaves with an angular incisure, and smooth surfaces on both sides. According to Marshall the leaves of this tree stand upon long, flat, slender footstalks, which render them liable to be shaken by the least wind; whence it has been called the trembling poplar or aspen-tree. This tree will grow on most kinds of soil, but may be cultivated to the greatest advantage on such as are inclined to be moist, without having much stagnant surface water. In such situations, they will sometimes grow to a considerable size. They may be raised in the same way and with equal facility as the common poplar. The wood of the aspen-tree is light, porous, and open; consequently of little value as timber.
timber. From its lightness, it might however probably be used to advantage for the purpose of common field-gates, hurdles, and other similar uses. In Mr. Marshall’s Treatise on Planting, it is represented as wholly unfit for being let in such grounds as are intended to be kept for pleasure, on account of the great number of succours that are annually thrown up by it. See Populus.

**ASPENII**, in Ancient Geography, a people of Pamphylia, who inhabited the town of Apseus. They fortified their town in order to dispute the payment of the tribute which they had promised to Alexander; but he marched against them, and compelled them to submit; and afterwards doubled the tribute which he had at first demanded.

**ASPENDUS**, a town of Pamphylia, situate upon the Euremedon, at the distance of 60 stadia from the sea, according to Strabo, who says that it was well-peopled, and that it had been founded by a colony from Argos. In M. D’Anville’s map, it is placed between Perga and Sida.

**ASPER**, or **SPIRITUS ASPER**, in Grammar, denotes a character, or accent, in form of a η, placed over certain letters, in the Greek tongue, to shew they are to be strongly aspirated, and that the breath is here to supply the place of an η as ηευς water. The spiritus affer, or that mark which corresponds to the letter Η, was undoubtedly in use among the ancient Greeks. Their Η was at first a spiritus affer, and was taken from the Hebrew ת, and was retained in the same figure Ӄ in Latin. The Greek Η was used in ancient monuments, instead of a spiritus affer, and the same letter stands for 100, because they wrote the word ἵκατον, thus, HEKATON. Nevertheless, the ancient Greeks did not judge it necessary always to express this aspiration upon their monuments. Thus upon a medal of the Tyrians we find 1ΕΠΑΚ. Hence it is very doubtful, whether this aspiration was in common use in the time of the apostles; and it becomes much more doubtful, when we consider, that the most ancient versions so frequently confound ηευς with ηευς, that both words seem to have been written without an aspiration. Martin’s Michadis, vol. ii. p. 522. See ASPIR.

**ASPER, or ASPER**, in Commerce, signifies a small Turkish silver coin, wherein most of the grand signior’s revenues are paid.

The affer may be estimated at 6 deniers (one farthing). — The only impression it bears is that of the prince’s name under whom it was struck. — The pay of the janizaries is only distributed every three months, and has a progressive increase from 3 aper to 99; and 99 aper are equivalent to 391 sous, or about two-thollings and three-farthings. But from an estimate made of the respective currency, the course of exchange reduces it to 39 sous 6 deniers (13, 7d. ¾); though this calculation is much above the intrinsic value of this coin.

**ASPER**, in Conchology, a species of **Murex** described by Martin, (Conch. 4. 1. 1525.) It is the largest oyster, and, when fresh, is a large, white, shiny, oval shell, with a red, brown, or black body. In the Gmelinian Syllaena Nature, there is also another species of **Murex** under the same name, which is a native of Guinea; the whorls of the siren are fulcated transversely, inflated, and muralcous; and the tail (or beak) ascending. The colour is milky white, with rows of brown dots; solid, with from twelve to fourteen furrows; aperture rather oval; and a single piait on the pillar lip. Gmelin.

The first species belongs to the section Caudigeria, cauda tubularia cauda recta elongata, tertia inermis (or murices, with tubulate, straight, elongated, and closed beak, and shell margin); and the second to turriti sphen; cauda breviflora (murrices tapering, tubulate, and furnished with a very short beak).

**ASPER**, a species of **Trochus**, figured by Chemnitz, the native place of which is unknown. The shell is oblong; whorls round, with many rows of tubercles, fulcated and inflated transversely; pillar-lip dentated; aperture lunated. This kind is of the middle size, chesnut, or taffaceous; lip plaited and rugose within.

**ASPER**, in Entomology, a species of **Cerambyx** (Stenocerus Fab.), a native of Italy, and figured by Sulzer. It is black, rough, thorax armed with two spines; wing-cases tuberculated in the middle. Sulzer, &c.

**ASPER**, a species of **Scarabeus** found in Europe; the head and thorax are grooved transversely; wing-cases spined. Fabricius, &c.

**ASPER**, a species of **Cancer** found on the British coast. The thorax is heart-shaped, spinous; two spines on the prothorax; legs and arms spinous.

**ASPER**, in Ichthyology, a species of **Perca**. It is falcated with yellowish, and has thirteen rays in the second dorsal fin. Johnston, Ray, and others, call this asper plicculus; and asper plicculus, gobioincus fundus.

**ASPERA ARTERIA**, in Anatomy. See Arteria Asp.

**ASPERSA**, in Conchology, a species of **Tellina**, about an inch and three quarters in length, and three inches in breadth. This shell is pointed at one end, yellowish within, and externally radiated, and rough, with transverse lines. Gmelin. Country unknown.

**ASPERRANA**, in Entomology, a species of **Phalena** (Trionix), found in the vicinity of Hamburg, and other parts of Europe. The anterior wings are white at the base, brown at the tip, and rough. This insect belongs to the Tortex section in the Linnaean and Gmelinian arrangements; in that of Fabricius to the section Pyralis.

**ASPERRILLA**, an European species of **Phalena**, of the *Tinea* tribe. The anterior wings are whitish, emarginate at the tip, with two common black spots. This is phalena linea alba albidis; macula communis feca, apicibus nigro punctatis reticulatis of Linn. *De Inf.*

**ASPERVERAE**, in Geography, a small town of Holland in the country of Gorkian or Arkel, seated on the Linge, two leagues north-east from Gorkum, and five south from Utrecht.

**ASPERSIONELLOS**, in Botany, the name given by Micheli to that genus of mosses called by Dillenius and others, *bifflis*.

**ASPARGILLUM**, in Antiquity, a long brush made of horse-hair, fixed to a handle, whereby the fuital water was sprinkled on the people, in lustrations and purifications. Horrey Brit. Rom. lib. ii. cap. 1.

This is also denominated *aspergile*, and *asperforium*. The ancients, instead of a brush, made use of branches of laurel and olive. It is also used in Ecclesiastical Writers, to denote the instrument, in Romish churches, wherewith holy water is sprinkled.

**ASPERSIFOLIOUS**, in Botany, one of the divisions or classes of plants in the Fragmenta Methodi Naturalis Linnaei; so denominated, because they are usually rough-leaved. According to Mr. Ray, these plants make a distinct genus, the characters of which are, that the leaves stand alternately, or without any certain order, on the flanks; the flowers are monopetalous, but they have the margin cut into five divisions, sometimes deep, sometimes shallow; and the upper spike or top of the plant is often curved back, something like a scorpion’s tail.
In the place of each flower, there usually succeed four seeds; Mr. Ray supposes the cerinthe the only plant of this genus that hath less than four seeds at the base of each flower; this indeed hath but two.

To the clafs of herbs alpephilofia, referred in the Linnean system to the monopetalous tetrapermous dilinition, under the clafs of pentandria and order of monogynia, belong the pulmonaria, cyngofloum, borage, anchula, echium, heliotropium, lathifpernum, cerinthe, heliotropium, mylotus, symphytum, onofia, aperugo, lycopsis, paran, tournefortia, and melchioria.

They all possess the fame general virtues, and are called glutinous and vulnerary.

ASPERITY, implies the inequality or roughness of the surface of any body; by which some parts of it are so much more prominent than the rest, as to hinder the hand, &c. from passing over it with ease and freedom.

Asperity, or roughness, stands opposed to smoothness, evenness, politure, &c.—From the asperity of the surfaces of contiguous bodies arises friction.

According to the relations of Vermaufen, the blind man is famous for distinguihing colours by the touch, it shou'd appear, that every colour has its particular degree and kind of asperity. He makes black the roughest, as it is the darkest of colours: but the others are not smoother in proportion as they are lighter; i.e. the roughest do not always reflect the least light: for, according to him, yellow is two degrees rougher than blue, and as much smoother than green. See Colours.

ASPENATA, in Entomology, a species of Phalena, of the geometra family, described by Linnaeus. The wings are whiti; anterior margin subferrugineous. Inhabits Europe. Muf. Leil. Gmel. &c.

ASPEROSA, in Geography, a town of European Turkey, which is a bishop's see, seated on the north-east of the Archipelago, and not far from the island of Taffo, opposite to the northern point of which is a cape of this name. N. lat. 40° 58′. E. long. 24° 20′.

ASPERRIMUS, in Conchology, a species of Murex. The shell is brown, varied with yellow and white, and ribbed; whors oblique, with a tuberculated margin; a brown band in the middle, and another of white; tail short, dilated, and acceffing; length about two inches. Gmelin, &c.

ASPERSA, is a species of Helix that inhabits Italy. The shell is subimperforate, rather globose, pale yellow, with four rafous bands interrupted with white spots; lip white. Müll. Gmel. This kind is from an inch to an inch and a half in diameter; fibroflage, with minute impreffed dots; rarely white; whors four, and the aperture elongated. The synonyms, quoted by Gmelin, are very doubtful, if not incorrect.

ASPERE, in Natural History, a species of Ascidia, described by Müller, Zool. Dan. as a native of the Norway sea. This is rather compreffed, and somewhat rough, white, bag spotted with red. Adheres to sea-weeds; is heart-shaped; skin peUucid, and smooth within; bag yellow.

ASPERSED, in Heraldry, a term sometimes used instead of powdered or flowered.

ASPERISION, formed of the Latin apergere, to sprinkle; of ad, to, and spergo. I scatter, the act of sprinkling with water, or some other fluid.

Some content for baptism by aperfor, others by immersion.

ASPERSEIRICH, in Geography, a town of Germany, in the archduchy of Austria, five miles to the south-east of Peyrbach.

ASPERSTORFE, a town of Germany, in the archduchy of Austria, two miles north-east of Sonneberg.

Species. i. A. proculum, procumbent aperugo, or German madwort. Hud. 82. With. 231. Smith Brit. 220. Flora Dan. 552. Eng. Bot. 651. “Calyx of the fruit flat.” Root annul, small, attenuated; flas procumbent, angular, rough, leafy; leaves opposite, ascending, oblong, rough; flowers axillary, solitary, pedunculated, fmall, blue; calyx of the fruit large, comprefied, fhoie, reticulated, with a fetaeous margin, concealing the feeds. It grows among rubifh in roads, &c. flowering in April and May. Small wild buglows, or borrago, great goode-grafs, are alfo names under which it has been known. 2. A. egypfiato, Egyptian aperugo. Jacq. Hort. v. 9. t. 21. “Calyx of the fruit, swelling.” Root annul; flas eight inches high, with diverfifying hispid branches; leaves broad-lanceolate, alternate, befet with rough hairs; flowers yellow, all directed the fame way, on thick falks. A native of Egypt, flowering from June till August.

Propagation and Culture. The fecond, or Egyptiania species, may be raised from seeds fown in a temperate hot-bed. The plants will flower in the open air in fummer, but they muft be houfed in winter.

Species. i. A. odorata, fweet woodruff or woodroof. Hud. 66. With. 185. Smith Brit. 172. Curt. Lond. f. 14. t. 15. Flor. Dan. 562. Eng. Bot. 755. “Leaves eight in a whorl, lanceolate; flowers fpacefied, pedunculated; fruit hispid.” Root perennial, creeping; flas erect, fimpie, fMOOTH; leaves fen, nine, but most commonly eight in every whorl, elliptic-lanceolate, rough at the edge; panicles terminal, trifid, or dichotomous; flowers white, fometimes sweetfented, about four; fruit rouf, with fetaeous hairs. When recent, the plant is notorious; but on being dried, it is very fragrant like vernal grafs. It grows in woods, flowering in May. 2. A. arvenfis, blue woodroof; “leaves fix in a whorl; flowers fimple, terminal, aggregate.” Root annual, fponder; flas a foot high, roughfhit, jointed, dichotomous; leaves linear-lanceolate, beneath whitifh with hairs; a close umbof of fiffle flowers terminates the fem and branches; flowers blue. A native of the south of Europe, flowering in July. It was introduced here, in 1772, by M. Richard.
ASP

Richard. 3. A. turina, broad-leaved woodrood; "leaves four in a whorl, ovate-lanceolate; flowers in terminal branches." Root perennial, woody; stems a foot high, branched; leaves hairy, serrated; peduncae one or two; bracts elliptic. A native of the mountains of Switzerland and Italy, flowering in June. It was cultivated by Miller in 1739. 4. A. cristatella, thick-leaved woodrood; "leaves four in a whorl, oblong-lateral, revolute, blimth, pubescent." Stems alternately branching; leaves the length of the internodes; the whorls on the branches more remote, and leaves narrower, unequal; flowers few, in upright terminal branches, pubescent on the outside. A native of Crete and the Levant, flowering in June. Introduced here by Moss. Thunb. in 1775. 5. A. calabria, Calabrian woodrood, L'Herit. fl. & fr. nov. 2. 63. t. 32. "Leaves four in a whorl, olivoid, obtuse, smooth, and even." A much-branched, a cubit high, glabrous, deciduous. Leaves linear-lanceolate, one-served; there is a short sharp upright fimbria between the leaves, half embracing the stem; flowers three or four, in terminating corymba; bracteae two-leaved, acute, enclosing a little below the germ. A native of Syria. The fimbria of this sufficiently distinguishes it from the other species. 6. A. inornata, narrow-leaved woodrood; "leaves linear, the lower six, the middle four, in a whorl; stem fuscous; flowers generally trinod." Stem branching, procumbent, three feet in length; leaves resembling those of wild thyme; peduncles from the axils of the leaves, forming little umbels; flowers white; seeds smooth. The roots are used in Gothland for dying wool of a red colour. A native of Sweden, Germany, Switzerland, &c. Cultivated by Mr. James Gordon in 1764. 7. A. pyrenaica, Pyrenean woodrood; "leaves four in a whorl, lance-oblong-linear; stem erect; flowers generally trinod." Root perennial; stems fix or seven inches high; leaves keeled, acute, smooth; lower ones shorter, more obtuse, lanceolate; upper and floral leaves opposite, broader; flowers red. A native of the Pyrenees, and about Basil. 8. A. cynanchica, squinancy-wort, or small woodrood. Huds. 66. With. 186. Smith Brit. 175. Eng. Bot. 33. Rubicola vulg. &c. Ray Syn. 225. "Leaves four in a whorl, linear; the upper ones very unequal; flowers all quadrifid; fruit smooth." Root perennial, fibrous; lower leaves in fours, on the branches obovate; upper leaves linear, and those near the top very unequal, so that the intermediate pair seem diminished into fimbriae; umbell terminal; corollas of a fresh colour, marked with red lines, fragrant; fruit smooth. It grows in England on warm banks, affecting a calcareous soil. 9. A. crista,i, or cristate woodrood; "leaves linear, rather flatter; lower ones four in a whorl, flowers suberect awned." Stem upright; flowers pale, yellowish, placed parallel, divisions bluntly awned. A native of the south of Europe. 10. A. pectinata, thinning woodrood; galium rotundifolium, Jacq. Adl. i. 58. t. 94. "Leaves four in a whorl, elliptic, terete, smooth, pinnate deciduous, trichotomous; seeds roughish." Stem fimbriae, smooth, spreading; leaves subpetiolate, obtuse; flowering branches horizontal, bifid; flowers two, small, lanceolate; flowers white, usually in twos. 11. A. hexaphylla, fix-leaved woodrood, Alston Ped. i. 77. "Leaves fix in a whorl, linear; flowers umbellated, terminal, subumbellate." Root perennial; stems generally fimbriae; leaves acuminate, flat; umbels accompanied with ten or twelve leaves; corollas purple, white within; segments a little revolute; seeds oblong, compressed. It grows in the fillures of rocks near Tarentum. Propagation and Culture. All these plants being perennial, except the second, may be increased by the roots as well as by the seeds. The first will prosper under the shade of shrubs in wilderseas quarters. The fifth must have the protection of a green-house, and does not continue many years; but may be increased both by seeds and cuttings. The eighth growing naturally in chalk, and most of the others being natives of rocks, must have a dry open situation. Marien's Miller's Diet.

ASPERSUM, in Conchology, a species of Buccinum, about an inch and an half in length. It is figured by Liiter, but its habitat is unknown. The whorls of its spire are ribbed, and fringed transversely; the siphon is gibbous, and the tall (or beak) rather prominent. Cinem, &c.

ASPET, in Geography, a town of France, in the department of the Upper Garonne, and chief place of a canton in the district of St. Gaudens; two leagues south-east of St. Gaudens. The place contains 3295 inhabitants: the territory includes 259 kilometres and 18 communes.

ASPETYLLA, a town of Spain, in the province of Guipuscoa, seven leagues from St. Sebastian.

ASPHALITES, in Anatomy, the fifth vertebra of the loins. It is thus called, because conceived as the support of the whole spine of the loins; from the privative α and σπαλλε, I supplant.

ASPHALITIC LAKE, in Geography, a lake of Palatinia, so called from the great quantity of bitumen, called asphaltum, which it produces. It has also been called the Dead Sea. From a supposition that no fishes will live in it, and that birds, which have attempted to fly over it, have been suffocated. From its situation, it has been denominated the Salt Sea; and distinguished by other appellations, as the Sal The, the Sea of Sodom, the Sea of the Desert, and the Sea of the Plain, by the sacred writings. Its origin has been ascribed to the submersion of the vale of Sihon, where once stood, according to common report, the three cities which perished, in the miraculous conflagration, with those of Sodom and Comorrah. These cities have, on account of their number, been called Pentapolis. Strabo, however, on the authority of an ancient and received tradition, reckoned thirteen of these cities, of which Sodom was the capital; and he adds, that they were overthrown by a violent earthquake occasioned by subterraneous fire, that threw up this great and sulphureous lake, in which all those cities were swallowed up. Josephus likewise affirms, that in the overthrow of Sodom, this vale became the lake Asphalite. It has been said, that the ruins of these cities are still to be seen in clear weather; and we likewise read of apples that grew about it, fair without, but bitter to the taste and filled with ashes, which added to the deadly nature of its water and fumes, afforded another evidence of the divine indignation. Some of the circumstances that have been recited concerning this lake, and which have long obtained credit, have been contradicted by the testimony of more modern travellers. Although it was long thought that nothing would sink in the waters of this lake, and that no animal could live in it, yet Dr. Pococke affirms us, that much as their specific gravity is augmented by the salt with which they are impregnated, several periwinkles, and among others this writer himself, swam and dived in this lake, and birds have flown over it with safety. It is possible, indeed, that the specific gravity of the water of this lake may have been diminished since the experiments made by Vepianus, and recited by Pliny (N. H. i. v. c. 15), because great quantities of the bitumen have been collected and removed, and this lake has been supplied with copious streams of fresh water. Mr. Kirwan says (Analysis of Mineral Waters, p. 144.), that the heaviest water of which he has met with any account is that of this lake. Lavoisier found...
found it 1.24c; and that it contained 44.4 per cent. of fatty matter, of which 62.75 parts were common fat, and 51.78 a kind of bituminous matter and glutinous magnesia. See Merian, 1778, p. 65. From these facts the water derives its bitter taste; and the bitumen which floats upon the surface of this lake, and which arises from its borders or its bottom, does not communicate to it any quality. As to the fact which it produces, the Arabs furnish themselves with large quantities by digging pits about the shore of the lake, filling them with water, and leaving them to be crystallized by the sun. As to the bitumen, which gave name to this lake, it is said to have thrown up great quantities of it, and that it is much valued by the Egyptians and the inhabitants of other countries for the purpose of enclosing dead bodies. Indeed Josephus affirms us, that Remondus in unis was so anxious without its head, and even of a larger size. Mr. Maundrell says (Journey, p. 84.), that there was no bitumen in the place where he happened to be; but that it is gathered near the mountains on both sides in great plenty. Pococke, however (Travels, p. 56), observed it to float on the surface of the water, and after windy weather to be found on the shore, where the Arabs gather it for the purpose of applying it to the same use with common pitch; and Dr. Shaw (Travels, p. 34.) informs us, that he was assured that the bitumen is raised at certain times from the bottom of the lake in large bismuthes, which, as soon as they touch the surface, and are acted upon by the external air, burst at once with great smoke and noise, like the pulvis fulminentum of the chemists, and divide themselves into a thousand pieces. This, he adds, only happens near the lake; for in great depths, the eruptions are supposed to discover themselves in such columns of smoke as are now and then observed to arise from the lake. This bitumen is described by the Arabs under the name of bitumen, and not to be distinguished from it except by its fulminating and solid smell, occasioned either by friction or by being set on fire. Some persons have confounded it with a blackish combustible stone thrown on the shore, and sometimes called "Mofab's stone," which held in the flame of a candle, will soon burn, and emit a smoke and intolerable stench. Whilst its weight is much diminished, it retains its bulk, and becomes of a whitish colour. Dr. Pococke observes, that these stones are found about two or three leagues from the shore; and he supposes, that a fragment of this kind of stone under the lake is probably one part of the matter that feeds the subterraneous fire, and causes the ebullition of the bitumen.

Mr. Maundrell informs us, that he saw several birds flying about and over this sea without any visible harm; and he supposes that the tradition which reports, that no animals can live in these waters is false, as he observed among the pebbles on the shore two or three shells of fith resembling oyster shells, which were cast up by the waves. He surveyed the waters with attention, in order, if possible, to discern the ruins of the abandoned cities, but he failed in his attempts to discover them; he was told, however, by two aged persons, not defective of understanding or probity, that they had once actually seen one of these ruins near the shore, and the waters being shallow, they went to it, and found there several pillars and other fragments of buildings. As for the apples of Sodom, Mr. Maundrell neither saw nor heard of any; nor was any tree to be seen near the lake from which such kind of fruit might be expected. A late traveller, Mr. Vinney (Travels in Egypt and Syria, vol. i. p. 210.) says, that this lake contains neither animal nor vegetable life. Nevertheless, when here perceived on its banks, nor are fish to be found in its waters; but it is not true, adds the writer, that its exhalations are pestiferous so as to destroy birds flying over it. It is very common to see swallows skimming its surface, and dipping for the water necessary to build their nests. The red crust which deprives it of vegetable and animal life is the extreme depth of the water, which very much exceeds that of the sea; the fall of it, is so great, that it is impermeable to vegetation, and hence proceeds the deathly aspect which reigns around this lake. The origin of this matter (says Mr. Volney) may be only discovered; for on the south-west there are masses of fossil块, which are fitted in the sides of the mountains extending along that border, and which have, for time immemorial, supplied the needful burning fuels, and even the city of Jerusalem. On this lake are also found fragments of flight of bitumen, which the Arabs convert into a useful article of commerce. There is also found a fort of rock, which, with fritillary, is a curious smell, burns like bitumen, works as a pitch like white lead, and is used for the purposes of course and East red sand, may likewise be used for a black ink, which has been made for months and centuries, and which puts up ignorant and supposititious stories for monuments of the invention of Lord, wife. Dr. Shaw well informs us that on the west side of the sea is a small crater, from which issued the monument of Lord's invention, but that part of which, as he was told, was visible at this time. But he had neither faith enough in the report of his informer, nor sufficient leisure for examining the truth of this fabulous relation. One remarkable property of this lake remains to be mentioned; and this is, that though it receives the Jordan, the brooks of Jabesh, Kibron, Annon, and other springs, which rush down from the adjacent mountains, yet it never overflows; this circumstance has led some naturalists to imagine that there is a subterraneous communication between this lake and the Mediterranean, or the Red Sea. But no gulf of this kind has been discovered; nor, indeed, is it necessary to recur to any hypothesis of this kind; since it has been demonstrated by accurate calculations that evaporation is more than sufficient to carry off the waters with which the lake is supplied. This evaporation is, in fact, very considerable, and frequently becomes sensible to the eye by the foggs with which the lake is covered at the rising of the sun, and which are afterwards dispersed by the heat. This lake is included on the east and west by very high mountains; on the north it is bounded by the Kalm of Jericho, which side it receives the waters of Jordan; on the south it is open and extends beyond the reach of the eye. De Bell. i. liv. c. 13. De Bell. i. liv. c. 15. This lake the length of 500 furlongs, from the mouth of Jordan, to the town of Seor or Zehel on the opposite shore, or about twenty-two leagues; and a breadth of about 150 furlongs, or five leagues; but Mr. Maundrell ubi supra, p. 84) says, that it is twenty-four leagues long, and six or seven broad.

ASPHALTUM, in Mineralogy, denotes a kind of bituminous stone, found near the ancient Babylons, and lately in the province of Neufchatel; which, mixed with other matters, makes an excellent cement, incorruptible by air, and impermeable by water; this was supposed to be the mortar so much celebrated among the ancients, where with the walls of Babylon, and the temple of Jerusalem were cemented.

It yields an oil which defends ships from water, worms, &c. much better than the ordinary composition; and which is also of good service for the cleansing and healing of ulcers, &c. See Mineral Parvus.

ASPHAX, in Ancient Geography, a nation of the Isle of Cyprus, Steph. Byz.

ASPHODELUS, in Botany, asphodel or king's-spear.
SPECIES. 1. A. latens; yellow asphodel, or king's-spear, Jacq. Hort. 1. 52. t. 77. "Stem leafy, leaves three-sided, lined." Root composed of flaky long thick tubers; stalks round, simple, about three feet high, and wholly covered with long triangular boat-shaped leaves. The upper part of the stalk is crowned with yellow star-shaped flowers, which open in succession, about the beginning of June. Peduncles one-flowered, arising from the axil of the bracts, which are membranaceous, thin, whitish. The corolla has a sweet smell, and is so deeply divided as not to seem monopetalous, and the divisions or petals are alternately narrower. It is a native of Sicily. 2. A. ramans; branched asphodel. Villar's Dauph. 2. 255. Murray in Com. Gott. 1776. 37. t. 5. 2. A. albus. Mill. Dict. n. 3. "Stem naked, leaves eniform, keeled, smooth." Root composed of many tubers and fibres; leaves long, flexible, sharp at the edges, growing in irregular clusters from the crown of the root; stalks three feet high, budding off naked branches, from the upper part of which arise many star-shaped flowers, which are white, with a longitudinal purple line along the outside of each segment. A native of the south of Europe. 3. A. filifolia; onion-leaved asphodel. Gertr. Fr.rec. t. 68. Gourn. Hort. 174. "Stem naked, leaves stiff, tubulat, striated, subflabulat," annual; roots consist of many flaky yellow fibres; leaves in a large cluster from the crown of the root, convex on their under side, flat above and hollow. Flower stalks rise immediately from the root, and grow to the height of two feet, dividing towards the top into three or four branches, which are adorned with white flary flowers, having purplish lines on the outside; these come out in July and August, and their roots ripen in October. A native of the south of France, Spain, and the island of Crete. Sopolli has described and figured another species, which he named aphodesibus libertinus; it has yellow pendulous flowers, flecked with five brownish lines, and has flaxen-coloured filaments. It was found in Iberia by Mygind. See Flor. Carn. n. 411. t. 12. The three former species were cultivated by Gerard in 1596.

AS P

PROPAGATION AND CULTURE. The first species multiplies very fast by roots, and will soon overgrow a large border, if suffered to remain undisturbed. The second does not increase very rapidly by roots, nor should it be often transplanted, for that will weaken it; therefore the best way is to propagate it by seeds. These asphodels are pretty ornaments in a garden, and requiring very little trouble to cultivate, are rendered more acceptable. They may be propagated by seeds which should be sown soon after they are ripe, on a warm border of light fresh earth; in the spring the plants will appear, when they are to be carefully cleared from weeds, and in dry weather frequently watered, by which means the plants will be in a proper state to be transplanted the Michaelmas following. A bed must then be prepared in the overseer nursery of fresh earth, into which you should plant the roots, at about six inches distance, and so deep that the top of the roots may be three or four inches under the surface of the bed; and some old tan or dung spread over the bed to keep out the frost. In this bed they are to remain one year, by which time the roots having acquired strength enough to produce flowers the following year, they should in autumn, when their leaves are decayed, be carefully taken up and transplanted into the flower garden, observing to place them in the middle of the borders among various kinds of flowers, where being properly intermixed, they will make an agreeable variety, and continue a long time in flower. The third kind is an annual, and can only be propagated by seeds which should be sown in autumn, and not removed till they have put out four or five leaves, when they are to be transplanted into the places where they are to remain. If the seeds of this plant are permitted to satter, they will come up without care, and those which are not removed will be the strongest, and produce a greater number of flowers. See Martyn's Hiller's Dict.

ASPHYLIA, in Medicine, a term which, in its literal sense, signifies a want of pullulation, being derived from a privative, and ἁπλος, sparse. It is used to denote apparent death, or those stupors which are produced by Cupid. a sopor and syncope; but in the system of Sauvages they constitute a distinct genus, under the above name. The last-mentioned nosologism has been too minute in his subdivision of this, as well as of many other diseases. The following appear to us to be the only legitimate species; viz. A. subf stimuli, apparent death from Drowning; which fee. A. jufp sinus, apparent death from Hanging; which fee. A. conglaterata, apparent death from exposure to extreme cold. This we shall notice here, as the most convenient place. In the northern latitudes, frequent instances occur, during the winter season, of persons being frozen to death. Before this event takes place, they are seized with a general numbness, and an irreducible propensity to sleep, followed by stupor, and insensibility. In this apparently lifeless state they lie for several hours, more or less, according to the intensity of the cold, and the previous condition of the body. They are, however, yet recoverable by proper treatment; which consists in taking off the person's clothes, and rubbing the body all over with snow, or dashling cold water upon it. The friction should be continued for many hours, until signs of life appear; when the patient should be wiped dry, and put into a cold bed, in a room without fire; he should have but few clothes upon him at first. When the power of swallowing is restored, a small quantity of white wine and water (two parts of water to one of wine) should be given in a tepid state; but on no account any spirituous liquors, such as brandy, rum, &c. Afterwards he may have tea, with a large proportion of milk, increasing the quantity of nourishment gradually. He should avoid a heated room for a day or two, as well as all strong drinks and seasoned food; otherwise a fever, or dangerous local inflammations, will be excited. Travellers or others who are about to be exposed to extreme degrees of cold, should be cautioned against the use of spirituous liquors, and every effort should be exerted by their companions to prevent them from falling asleep. For the treatment of partial injuries from cold, see the article Frost-Bitten. A. a carbonic (A. carbonica, as we would term it), suffocation from the fumes of charcoal, from the gas thrown out by fermenting liquors, &c. (i.e. suffocation from the carbonic acid gas.) See Suffocation. A. necy torum, apparent death of new-born infants. See Midwifery.

ASPICA, in Ancient Geography a river of Italy, in Picenum, north-call of Auxitium.

AS PIC,
ASPIC, Fr. in Artillery, a piece of ordnance, weighing 4250 lb., and carrying a 12 lb. shot.

ASPIC, in Botany, a plant which grows in plenty in Languedoc, in Provence, and especially on the mountain of St. Julian. It is a kind of lavender, nearly like what grows in our gardens; both with regard to the figure and colour of its leaves and flowers. The botanists call it made lavender, because it is a species of Lavandula, or spike nardus, Pseudonardus, &c.

ASPIC, Oil of. See Oil of Spikes.

ASPIDO, in Geography, a river of Italy, in the marquisate of Acasia: it rises near Polveriga, and runs into the Mulana, a little above its mouth in the Adriatic Sea.

ASPIDOPHORE, in Ichthyology, the name of a new genus of fishes in Lacépède's arrangement. This genus is composed of two species of Cottus, in the Linncean syltes called Calaphrubius japonicus, the former of which M. Lacépède names Pseudophorus armé, and the latter Pseudophorus lifrea. See Cottus.

ASPIL, in Aust. of Geography, a powerful people of India, whom Alexander defeated in a pitched battle near the river Euaphla. He had previously crossed this river, as well as the Choe; and after the battle he passed through the territory of the Garezi, and crossed the river Garezu, supposed by insig. Rennell to be the Kameh or Cabul river. This ingenious geographer conjectures, that the nations of the Apitl, Thyrei, and Aunasei were inferior divisions of the modern Cabul, and situated between the rivers of Ghizini and Cabul, at the height of Ijrab and Dukkham. Mem. p. 172.

ASPING, in Zoology, a name given by the inhabitants of Smoland to a venomous small snake, not more than six inches long, found in Oieties and Willow-holts, the bite of which is frequently fatal, and which is much dreaded by the Smolanders. It is the Coluber Chersea of Linnæus, with 150 abdominal scuta, and 34 subcaudal scales.

ASPIRAN, in Geography, a town of France, in the department of Herault, and chief place of a canton in the district of Lodève, two leagues north of Pezenas.

ASPIRATE, ASPERATIO, in Grammar, a character used to denote an aspiration. The aspirate, by the Greeks called spiratus aspiratus, and marked over their vowels, seems to be of a very different nature from the letters, but is nevertheless a true letter, as well as the reët, and a real consonant.—By letters we do not mean the characters of the alphabet, which are changeable according to the languages and the people, and among the same people, according to time and custom; and even according to the fancy of particular persons. Thus, some for instance, write the aspirates, or letters aspirated, which by others are omitted; though both the one and the other pronounce alike; as in haume, baume, an Italian word frequently written onoma, onomini. But by letters we mean articulate sounds, marked by them, and formed by the organs of speech, viz. the throat, mouth, tongue, palate, teeth, &c.

These sounds are of two kinds, the one simple, and the other compound, or modified. Simple sounds are those pronounced by a single motion of the organ, such are the vowels. Compound sounds are those same simple sounds modified by a motion of the organ, superadded to the motion necessary to pronounce the simple sound; of which kind are the consonants.

Now an aspirate is an effect or consequence of a motion made by some of the organs of speech; and therefore it must either be a vowel or a consonant. The former it cannot be, as not being a simple sound, it is impossible that it may be pronounced by itself. It must therefore be a modificative, or consonant; and in effect it has all the properties of one.

For, 18, It results from a motion of the organ, which of itself produces no sound. Thus the spiritus of the Greeks, our h aspirate, as well as that of the French, and other people, has no more found of itself than b, c, d, &c. and the same thing may be observed of the alphe, eth, and cep, of the Eastern languages.

20. On the contrary, our t, the spiritus of the Greeks, and the other aspirates just mentioned, are pronounced with all the vowels, in the same manner as consonants are. They modify those vowels, and are effects of a motion of the organ superadded to the motion necessary to form the vowel. Thus, to pronounce ha, two motions of the organ are required as well as for ba, or ca, &c. one for a, which itself is a sound; the other for b, which yields no sound, no more than h; but adds something to a which modifies it, and makes that h a not mere a, nor ba, nor ca, &c. and this must hold still more sensitively in the stronger aspirates, as those of the oriental tongues t, d, s, t, &c., in all which there are evidently two motions, the one to express the vowel, and the other to modify it: now this being the nature and essence of a consonant, it follows, that let them be denoted in what manner they will, whether as our t, as the oriental t, i.e. by proper characters in the course of the words themselves; or, as the Greeks do some of theirs, by a sign of aspiration placed over the vowel, it matters not. The aspirate is no less a consonant in 

{34} than in 

{35}; in 

{36} than in 

{37}; and so of others.

The third and last reason urged by form is, that the Eastern languages, which, according to them, do not express the vowels, do yet express the aspirates. This kind of argument feems, however, to be grounded on a mistake; since it is more than probable, that the 

{38}, 

{39}, 

{40} of those languages, should be ranked among the vowels, and were so used.

Add, that the aspirate is frequently changed into a consonant, and expressed by a consonant. Thus of is made for of the Hebrew 

{41} for the Hebrew 

{42} making no difference between 

{43} and an aspirate. Hence it follows, that aspirates are real consonants; and that we ought not to exclude the b in our language, out of the number of letters.

Other grammarians contend, that the b is founded only by a strong emission of the breath, without any conformation of the organs of speech, and consequently is no letter. See H.

ASPIRATION, the act of aspiring, i.e. of pronouncing any syllable, or word, strongly; with a good deal of breath, and vehemence.

This we do, for instance, in those words which have the letter b before them; as banogue, book, Holland, here, &c. whereas the like syllables are founded much softer and easier without the b; as car, cat, &c. See H.

ASPIS, in Ancient Geography, a town of Spain, north-west of Tircis and very near it on the same river.—Also, a town of Africa Propria, in 23° 20' N. lat. according to Ptolomy. —Another town of the same country, about 20° 20' N. lat. according to Ptolomy. Strabo places it in the Greater Syrtis, and says it is the best port of that coast. —Also, a hill or territory of Africa, in the promontory of Tapnitis, according to Strabo. —Also, a town of the Carthaginians, called Clypas. M. d'Anville thinks this to be the same with the former; but Ptolomy distinguishes them. —Also, an island of Aia, upon the coast of Aia Minor, between Tenedos and Teos. It was called, according to Strabo, Arconnis. —Also, a promontory of Ethiopia, near Egypt. —An island in the vicinity

ASPITHRA, a town of Achaia, in the country of the Sines. Ptolem. — Alto, a river of Achaia, in the same country.

ASPIUS, in Ichthyology, a species of Cyprinus, that inhabits the fresh water streams in most of the northern parts of Europe. Linn. in his Fauna Sueciae, describes it specifically as having fifteen rays in the anal fin, and the lower jaw longer than the upper one, and recurved. It grows to the weight of twelve pounds; is blackish above, and bluish-white on the sides; feeds on vegetables, worms, and little fish; spawns in March; flesh white, soft, fat, and well tasted. This is Cyprinus rapix ovatus subcompressus cardinalis, &c. of Leeb. Laccisculus argenteus, &c. of Klbh. and range of Gefner.

ASPLEDON, in Ancient Geography, a town of Bactria, north-east of Orchomenus, from which it was separated by the farn river Meaxis.

ASPLENIUM, in Botany, spleenwort (said to be derived from a and πημε, because it was supposed to dry upon the spleen). Lin. p. 172. Schreb. 1611. Lingua cervina, trichomanes Tournef. Clas. cryptograma filices. General Char. Fructifications dispersed in right lines along the under side of the frond.

"Frond simplicissimis foliis." Speciosus, t. A. Athophyllum. root-leaved spleenwort, Phyllitis Phlik. Alm. 154. t. 105. f. 5. Morr. Hill. 2. 537. 9. f. 14. t. 1. f. 14. "Fronds cordate-ovatif undivided, top frill, rooting." Root fibrous; fronds triangular acuminate, point long hairs; at the base followed, varied, on long fructstocks; fructifications irregularly dispersed over the whole disc of the leaf in oblong spots; the ends of the fronds bent down to the ground, and there frisking root. A native of North America. Introduced here by Mr. Bartram in 1764. 2. A. leniolius, whole-tongue spleenwort. Lear, Cochbn. 667. "Fronds simple, cordate-lanceolate, frill-edged, entire; frills smooth and even." It riles about six inches in height, and nearly resembles No. 1. (tart-tongue), but the longitudinal diameter of the frond nearly exceeds the transverse one; the frills are slender in tufts; the lobes of the fronds are sublinear, unequal; fructifications in oblique lines. A native of the south of Europe. Introduced here in 1779. 3. A. fistuliferum, tart-tongue spleenwort. Hudf. 451. With 2. 51. Lightf. 660. Curt. Lond. t. 67. Bolton Fil. t. 13. t. 11. Wood. Med. Bot. t. 272. The varieties are &c. phyllitis crista. Bach Hill. t. P. F. Lingua cervina maxima, umbilifolium angulo perfin. Phlik. phyt. 2. Lingua cervina, multifo. f. Bach. phyt. 1. P. F. Lingua cervina, minor crista, f. multifo. f. Bach. Phlik. phyt. "Fronds simple, cordate-lanceolate, quite entire; frills hirsute." Root black, hard, hairy, furnished with numerous fibres; frills and lower part of the mid-rib covered with chaffy scales; fronds from four inches to a foot long, and from an inch to two inches broad, lanceolate, rounded, and hollowed at the base of a stem tough texture, and at a shining green on the upper side, and more or less waved at the edges; fructifications in parallel lines; these are at first covered with a pale brown involucre, which bursts when the capsules fall; they then appear globular and brown, and each is furnished with a yellow oblong ring, by which the seeds when ripe are forced out of the capsule and dispersed to a considerable distance. It grows commonly on old walls, rocks, and in shady places. This plant, like some others of the same genus, was formerly used to strengthen the viscera, relieve haemorrhages, and abuse flexes, expel gravel, and open obstructions of the liver and spleen; but its medicinal qualities are now little valued. It is one of those termed the five capillary herbs. 4. A. nidus, bird's-nest spleenwort; "fronds simple, lanceolate, quite entire, smooth." Leaves two feet long, broad, thin, thick, smooth, thread-like; fructifications in parallel lines, extending one-third of the breadth of the leaf. It roots into the top of trees; the leaves come out in a circle, and form a kind of umbel, in the middle of which birds make their nests. A native of Java and the Society isles. 5. A. foratum, furred-leaved spleenwort. Phyllitis, &c. Sloan. Fam. t. 72. n. 5. "Fronds simple, lanceolate, furred, subacute," Root composed of brown fibres, which send forth eight or nine fronds about three inches long, gradually broader near the end, which is formed into a blunt point. A native of woods in the island parts of Japan. 6. A. plan- tigynum, plantain-leaved spleenwort, Brown. Jan. 92. "Fronds simple, ovate-lanceolate, subacute, frills quadrangular." The fronds rise from a thick fibrous root to the height of ten or twelve inches, with an even margin and a smooth frill. A native of Jamaica. 7. A. brownsi, lance-leaved spleenwort, Thumb. Japon. 335. "Fronds simple, elliptic, entire, frillis lanceolato; frills ovate-lanceolate; lines of fructification near the edge of the leaf, which is lanceolate. A native of Jamaica. 8. A. lirippe, double-leaved spleenwort, Lingua, cern. &c. Plm. fil. 116. t. 133. "Fronds pinnate; leaflets lanceolate, subulate, ciliate," Fronds all double, or composed of two equal similar leaflets, united at the base by a common membrane; the common peduncle forks a very little above the base, and forms the mid-rib. A native of South America.

"Frond pinnatissimus.

"Frond pinnatissimus.

13. A. trichomanes, common maid's-hair. Hudf. 452. With 2. 51. Bolton t. 22. t. 13. Wood. Med. Bot. 254. Eng. Bot. 556. "Fronds pinnate; pinnae roundish, crenate." Fronds about five or six inches long, lanceolate; frills and rachis smooth, glossy, blackish, purpl.; pinnae fifteen or twenty pairs, the lowest most remote, of an irregular oval figure, largest below; sinuate lines oblique to the mid-rib, three, four, or five in number. It grows in the crevices of rocks and walls, and in shady places among rocks. The leaves have been used in disorders of the breast proceeding from an acidity of the fluids, and also to promote the expectoration.
expectoration of tough phlegm, and to open obstructions of the viscus. They are usually directed in infusion or decoction, with the addition of a little liquorice. A syrup prepared from them is common in our shops, both as made here and imported from abroad; this latter has an admixture of orange-flower water. A little of these syrups, mixed with water, makes a very pleasant draught. 14. A. viride, green spleenwort. Hudf. 453. With 3. 52. Lightf. 663. Bolton Fil. 24. t. 14. Trich. colia viride, &c. Rain Syn. 119. 2. Trich. fol. eleganter incis. Tournef. Infl. 539. t. 350. f. 10. "Fronds pinnate; pinnas roundish, crested, truncate at the base." Pinnas eighteen or twenty pairs; leaflets sometimes alternate, rhomboidal, or trapezium-shaped. It is found on rocks in mountainous situations in the north of England. 15. A. ehrenbergi, ivory-tinted spleenwort. Ait. Hort. Kew. "Fronds pinnate; pinnas lanceolate, subfalcate, ferrate, crenated, ferrate, at the base; rile very glossy, simple." A native of North America. Cultivated by Dr. Pethergill in 1779. 16. A. dentatum, tooth-leafed spleenwort. Brown Jam. 93-5. Plun. Fil. t. 101. Pot. t. 2. f. 15. "Fronds pinnate; pinnas wedge-shaped, obtuse, truncate, entire." A native of South America, and the West Indies. We learn from Swartz, that the A. pygmaea L. is nothing more than the young plant of this species. 17. A. maximus, sea spleenwort, or dwarf sea fern. Hudf. With. Lightf. Bolton. 26. t. 15. Eng. Bot. 592. "Fronds pinnate; pinnas obovate, ferrate, gibbose, above obtuse, wedge shaped at the base." Fronds from three inches to a foot in length, but commonly five or six inches; riles smooth, reddish-brown; pinnas usually about twelve pairs, nearly rhomboidal, sometimes lanceolate, sharply crenate; lines of fructification four or five on each side of the nerve in an oblique direction. It grows on rocks on the sea coast. 18. A. calceolifolium, fiddle-leafed spleenwort. Plun. Fil. 42. t. 59. "Fronds pinnate; pinnas fiddle-lanceolate, galanthaceous, from the base downwards angulate." A native of Martinico. 19. A. echinosporum, Swartz. Obs. 399. Brown Jam. 92. Plun. alm. 9. t. 273-4. "Fronds pinnate, rooting at top; pinnas ovate, repand, somewhat crenated; very small ones remote, entire." About ten or twelve inches in length, with the top bending to the ground; the old plant is bipinnate. A native of Jamaica. 20. A. monanthum, one-celled spleenwort. Smith in ed. 3. 73. "Fronds pinnate; pinnas trapezium-shaped, obtuse, ferrate, entire; line of fructifications." Fronds numerous, linear-lanceolate, a foot high, often twilled; leaflets numerous, rather alternate, fiddle, line of fructification fiddle. The younger Linnaeus has conformed this plant with A. rectum. A native of the Cape. 21. A. rata moraria, wall-race, tent-wort, white spleenwort. Hudf. 453. With 3. 53. Bolton Fil. 28. t. 16. Eng. Bot. 150. "Fronds alternately decapomposed; leaflets wedge-shaped crenulate." Fronds three or four inches high, furnished at the end with two, or more commonly three alternate pinnas; they are short, broad, and somewhat of a rhomboidal figure; fructifications appear in two or three white dots on each side of the nerve. It grows on fillures of walls and rocks. 22. A. alterifolium, alternate-leaved spleenwort. Jacq. Mif. 2. 51. t. 5. f. 2. "Fronds simply pinnate; leaflets alternate, wedge-shaped, gahted above." Linnaeus regarded this as a variety of the preceding species, from which it differs in having the flens more simple, black at the base, with one or two short divisions only, having three leaves lobed and two-lobed; the other leaves are foliary; in the lower part of the leaf are two or three lines of a longish form. A native of Switterland and Austria. 23. A. odiuncum nigrum, black maidenhair. Hudf. 454. With. Bolton 30. "Fronds subtripinnate, leaflets alternate, pinnas lanceolate, galanthaceous, galanthaceous, galanthaceous, galanthaceous, galanthaceous, galanthaceous. Vol. III.

The following eight species are from Swartz.

wedge-shaped, pinnulas crose, toothed at the tip. 39. A. cicutarium. Swartz. 130. "Frons pinnae, very smooth, the upper one pinnatifid, leaflets lanceolate, entire." The fix last species are natives of Jamaica.
The following Species are from Forslender, and are all Natives of New Zealand.

41. A. lucidum. Forl. n. 427. "Frons pinnae; leaflets opposite, oblong-oblong, acuminate, verticillate. 42. A. po-

Propagation and Culture. Whoever is defirous of cultivating any of these ferns, must have walls or mounds or heaps of flou to set the hardy species in, or pots may be filled with humfy unduged earth, or sand gravel and lime rthritis for that purpose, placing them in the shade. Hart's-tongue, however, has been raised in pots; but all the pots may be increased by parting the roots. Some of the foreign species must be placed under a common frame in winter; and it is evident that such are natives of the West Indies and other hot climates, require the protection of a floue.

Asplenium. See Acrostichum, and Meniscium.

ASPOE, in Geography, a small island of Sweden, in the Baltic, two miles south-west of Carlston.

ASPOLA, in Ancient Geography, a municipal town of Aia Minor, in Galatia, in the road from Ancyrato Cefarea, according to Antonius's Itinerary.

ASPRONUM, a district of Aia Minor, near Per-
garamus; which, according to Strabo, was barren and flouy, and in which was a temple dedicated to the mother of the gods, called Apromis.

ASPAGGOMountain, in Geography, a high land of America, that lies on the promontory which separates Mahone from Margaret's bay, on the coast of Nova Scotia. This land, which is seen at a distance, is that which is generally made by the ships bound from Europe and the West Indies to Halifax. Its summit is about 500 feet above the level of the sea.

ASPA, a town of Italy, in the territory of the church, upon the river Aja, between Tivoli and Terni. It was formerly in the district of the Sabines, and called Cafferi, and Caffereta.

ASPRED0, in Ichthyology, a species of Silurus that inhabits the rivers in America. This kind has a single dermal fin, with five rays, and has eight cirri. Oml. The back is carinated, and the tail forked. Klein names it sauropa.
rises in Grafton, Worcester county, Massachusetts, and runs northward into Merrimack river.

ASSACANI, or Assaci in Ancient Geography, a people of India, who inhabited a country situated between Bazar, now Bijow, and Peacebottom, corresponding to the present Puckhool. The government of the country, when Alexander invaded it, was possessed by a woman, as Phatarah, Curtius, and Jullin agree; she was, as they say, the wife of Assacenus, and, according to the latter, her name was Cleophes. The Assaci, when they were attacked by Alexander, had, according to Arrian, (l. iv. c. 24, 25.) 20,000 Horse, 30,000 foot, and 30 Elephants, ready to take the field. Their capital was Maffaga, called by Curtius Magna, by Strabo Magosa, and by Diadomus Maffax, which Alexander took by assault, though he was wounded on the occasion, and repeatedly repulsed; and he then proceeded to.fummon Bazar, the capital of the next adjoining territory. After the capture of the rock Aornus, Alexander made a second expedition into the country of the Assaceni, in order to get possessions of some elephants which were fent thither that they might not fall into his hands. These elephants were at last found in the patares near the Latus, and sent off by land to the grand army. The country of the Assaci, afterwards called Asfagenus, answers, fays major Rennell, (Mem. p. 173.) to the present Sewad or Sowad; or at least Sewad was one of the divisions of Asfagenus. See Afsenagur, and Swad.

ASSACH, or Assath, in Antiquity, a kind of purgation, anciently used in Wales, by the oaths of three hundred men. It was abrogated by 1 Hen. V. c. 6.

ASSAD, in Zoology, the name by which some Arabic writers call the lion.

ASSA-DULCE. See Asa-Dulce.

ASSAFA, or Assaphenis, in Ancient Geography, an episcopal see of Africa, in Mauritania Sitifensis.

ASSA-FEITIDA, or Asa-Foitida, in Pharmacy, Teuffel's Drech, Ger. (Devil's Dung.)

This curious and valuable article of the Materia Medica is a gum resin procured from the root of a large umbelliferous plant, growing in the mountains of several provinces in Peru, and on the borders of the Persian gulf, and called in the language of the country bingfish. For the botanical description of this plant, see Ferula Asa-Foetida.

The Asa-fœtida is brought over in maffes of various size and form, of a yellow brown, or bluish colour, intermixed with roundish pieces, white in the inside, which are the Asa-fœtida in tears, and the purest.

The taste of this gum is bitterish, acid or biting, and very permanent on the tongue; when chewed, it becomes plastic, and soon dissolves in the saliva into a white milky liquid. Asa-fœtida is principally distinguished (as its name imports) by its exceedingly strong fœtid smell, somewhat reeking that of garlic; which is extremely offensive and permanent. The odour, however, is not of a sickening or very oppressivf quality, and so ready can the organs be accustomed to it, that this gum makes a favourite feathing for food in many countries of the East.

By chemical analysis, asa-fœtida is found to consist of an essential oil, a resin, and a gummy substance, so that it is with great propriety reckoned among the gum resins. Trommsdorff obtained about fifteen or sixteen grains of essential oil from an ounce of the gum, which in one experiment swam upon the water with which it was diffused, and in another partly sunk to the bottom. The remaining gum yielded 108 grains of resin, and 292 grains of gum. The analyses of Neuman and Cartheufer exhibit the same ingredients, but in different proportions. Both spirit and water diffused off this gum resin are strongly impregnated with a strong fœtid smell. If asa-fœtida be digested with warm water, the liquor presents a whitens, and by long standing the whole is reduced into a soft pulpy mass of a dirty yellow, owing to the solubility of the gumma part. By triturating with water, this gum is entirely dissolved into a milky liquor which remains uniformly turbid for a considerable time. It is partly soluble in expreced oil, but scarcely in the essential oils.

The following curious and authentic account of the method of collecting the asa-fœtida is given from circuit diary by Kempfer, who visited the country in the year 1677. The plant which yields this valuable gum resin (and called in Periv kinezif) is found abundantly on the mountains around Hormut, the capital town of the province of Chorani, and in the province of Laer, which extends from the river Curru to the town of Cono on the Persian gulf. Beyond this, on the Arabian side, the plant is said to be found of its strong odour and acid quality, so that greats brown upon it with great delight and advantage. The rinds the soil, the more valuable is the gum. The principal harvest of this substance is made on the mountains around the small town of Disgumum, in the province of Laar.

The root of the kinezif grows for many years increasing in size, till sooner or later it sends forth the flowering umbelliferous stem, after which, on the succeeding year, the whole plant perishes. The crop of gum therefore is procured from the root before the time of flowering. When the root is four years old, it is about the thickness of a man's arm, and of considerable length; it seldom yields any gum before this age, and the older it is, the greater is the quantity of product. The root is heavy, smooth externally, when growing in a rich soil; but lealy in a sandy soil. It is often found bifurcated or further divided at about a foot below the surface. The upper part, which rises above the soil, is thickly beset with short fibres flapping up like hairs. The rind of the root is easily separable when fresh, the substance within is smooth and moist, consisting of a tough fibrous part, including a pulpy cellular portion, full of an oily white juice, of a most intensely fœtid smell, which when exposed to the air becomes first clammy and yellow, and at last hardens into the gum asa-fœtida. The intensity of the smell is the test of the goodness of the gum, and the odour of the fresh juice or recent gum is beyond all comparison more fetid than that of the gum as it is received by us. Hence in the gathering season, the whole town of Disgumum smelles of it; a single ship is exclusively devoted to transporting the bulk of this commodity to the ports in the Persian gulf; and in carrying smaller parcels they are tied to the top of the mast to prevent their infecting every thing on board. In a short time, however, this intensity of smell goes off.

The whole gathering of asa-fœtida is performed by the inhabitants of Disgumum in four different journeys to the mountains. The demand for the article in foreign countries being first ascertained to be sufficient to indemnify the trouble of collecting, the gatherers divide into companies of four or five each, and proceed to the mountains about the middle of April, when the leaves of the plant are turned yellow and decaying, a sign that the root is in a proper state to yield the juice. The first operation is to remove the soil for a hand's breadth from the plant, and to strip off the leaves and the hair-like fibres, leaving the root perfectly bare and smooth, which is again earthed round and covered with a bundle of its own or any other leaves at hand, to screen it from the sun. These bundles of leaves are confined by a large stone, left the wind should blow them off; for without this precaution, the leaf of the sun would
would destroy the roots in a day's time, and the juice would be spoiled. Each party of four or five men take to themselves about two thousand plants, and when several myriads of roots are thus prepared, the whole company return home.

In about forty days, or towards the end of May, the parties return to the mountain, and there at day break. The implements which they employ are a sharp knife for cutting the root, a broad and flat iron scoop for feraping off the dried juice, a small pan fastened to the thigh for receiving the contents of the scoop, and a double backet suspended at each end of a pole which is slung across the shoulders in order to carry the whole crop when they return home. They now uncover the root, remove the earth to a little depth from the top, and with the knife they cut off a small transverse slice. The root, in which the juice that has been collecting for forty days, has been made to flagrant by the previous operation of stripping off the boughs, now bleeds copiously; and it is immediately again covered with the umbrella of leaves as before, taking care that these do not actually touch the surface of the root and rub off the juice. On the ensuing day it is sufficiently concereted to be scraped off, after which another thin slice is cut off from the surface of the root, which bleeds afresh, and is allowed time to concture as before. This process is performed on half the roots on alternate days, that the employment of the gatherers may be more uniformly divided. After this collection has been twice made from each root, a third slice is cut off, the root is covered with its umbrella, and the whole company leave the mountain bringing home their first harvest, which to each party of five or six men is about fifty pounds weight of Affa-foetida. This first gum is reckoned of rather inferior strength to the subsequent crop, and is called Sirpur.

In about ten days the company again return to the mountain, making their third excursion, and they find on the top of each cut root a quantity of very fine and pure Affa-foetida, which having had time to concture very slowly, is esteemed the best and most powerful, and is called Pipas, and falls at a much higher price than the Sirpur... This latter, however, appears chiefly to owe its inferiority to a quantity of earth with which the gatherers adulterate it while yet in a very soft and semimollied state, whereas the Pipas being concreted into a hard gum is not liable to this abuse. After this latter is collected, two more succuface incisions are made, the juice is scraped off as before, the root is again cut and covered over, and the company return home.

The fourth and last excoration is made after an interval only of three days, for the root, which is exhausted by so many repeated bleedings, is now on the point of perishing. The Pipas, or first feraping, is again collected, and the root will bear about two or three more incisions, after which it is quite exhausted, and is left to die by the heat of the sun, which happens in a single day.

Each root of the four-year-old plants will bear ten or eleven succuface cuttings, but the large roots of twenty years' standing or upwards, such as are sometimes found in the less accessible parts of the mountain, will yield the gum much oftener, though not with such ease, so that the harvest from these is not facilitated till about the end of December.

It is not quite ascertained whether the ancients were acquainted with this gum rufa. Some authors have suppos'd it to be the σαφόνα, o' τον εισαφόνα, of Dioscorides and Hippocrates, and the Laferfium of Pliny, but of this there is considerable doubt. It may be mentioned that the root of a plant abounding in a milky juice exactly similar to the Affa-foetida was sent by professor Rallis to Dr. Guthrie, and transmitted by the latter to Dr. Hope, who succeeded in cultivating it in the botanical garden of Edinburgh some years ago. The botanical character of this plant, however, was far different from that given by Kömper (whose accuracy is much to be depended on), as to make it probable that there may be more than one species of plants which yield this fetida gum.

The ufe and virtues of Affa-foetida are very considerable. In many parts of Arabia and Persia it forms an important article of the Materia Medica, and is employed largely as a condiment for food. In its native country, the common people resort to it as a sovereign remedy for dropsy, flatulent and colicky pains in the bowels, and even as an external application to wounds. In the above disorders, its strongly stimulant and anti-paifonic power renders it peculiarly valuable, but the factor which transpires from the bodies and evacuation of those that use it is far excessive, as to be most intolerable even to the organs of the natives. The Banians (who, not using animal food, have always recourse to the strongfit and molten acid condiments, employ Affa-foetida liberally in their cooking, and even rub their mouth with it before they eat to whet their appetite. Another use common to this, as to all other stimulating and heating substances in the East, is to excite the veneral appetite. With us, Affa-foetida is considered as a most powerful nervine, anti-paifonic, carminative, and anthelmintic, though the potency of its odour, in which probably consists a large proportion of its medical virtue, prevents its ufe in a variety of cases in which it might prove highly beneficial. It is of the greatest service in hypochoondriac affections, in which the flate of the bowels is always torpid, and digestion liable to be deranged. For the true tympanites, a difter of two drams of Affa-foetida dissolved in water, thrown up once or twice a day, is an excellent remedy. Dr. Millar has introduced the ufe of this gum with great effect against the epistanic asthma, and the epistonic flate of hooping cough. The dose of the solution, even to children, should be larger; and it is worthy of remark, that the difgust excited by the strongly foetid remedy is much fooperfuelned than might at first be imagined, nor, when it is in the flemach, does it ever excite fickness. The flatulent colic attending hyferic affections is much relieved by this gum, exhibited either by the mouth or in gyllers. On account of its heating quality, it should be avoided when general fever is present. The vermifuge property of this gum appears to be very considerable. Kömper relates, that the leaves and falk of the fresh plant in Persia, are laid in the channels through which the water runs for irrigating gardens, and that frutefces and plants are thus preferred from all kinds of vermin. Probably its penetrating odour much incommodes the animals, and it has long been known both in the East and in Europe as a very powerful anthelmintic, especially when combined with the stronger purgatives, or given in the form of gyller, and followed by them. Hufeland has employed this gum internally as a very good remedy in venereal exofiiis, and caries of the bone, after the constitution has received as much mercury as it will bear.

Affa-foetida enters into some of the compound plasters for external application, and in this combination is reckoned to be ftemulant and refolvent.

The pharmaceutical preparations of Affa-foetida in actual ufe, are the following:

Lac Affa-foetida (P. Lond.); a milky solution of two drams of the gum in half a pint of water, formed by the allination of tritturation.

Tinctura Affa-foetida (P. Lond.); made by adding two ounces of Affa-foetida to a pint of rectified spirit of wine.
The fame in the Edinburgh Pharmacopoeia, but a quarter of a pint more of the spirit is used. Rectified spirit is employed, for the dilute or proof spirit, though it dissolves more of the gum, and makes a turbid solution; whereas the tincture with the former spirit is quite clear. It may be given in doses of from ten to sixty drops. The tinctura Eugeniae of the former Pharmacopoeia, now difcarded, was made with wood foot, affa-fetida, and proof spirit; but the foot is properly omitted, as it does not appear to add to the virtue of the medicine, and needlessly increases its nauseous odour.

Aquarius Ammoniæ fetida (P. Loud. and Ed.) prepared by diluting the spirit of ammonia with affa-fetida, whereby it is strongly impregnated with the peculiar odour.

Pilulæ Galbani composœ (P. Loud.), composed of several heating and gravelly gums, viz. galbanum, opoponax, myrrh, fagapenum, and affa-fetida. The proportion of the latter is one-ninth of the whole. Pilulæ Alfa-fetida composœ, formerly Pilulæ gummosœ (P. Ed.), composed of affa-fetida, myrrh, and galbanum, of each one ounce, and one drachm of oil of amber.

Emulsiferæ Alfa-fetidae, formerly Emulsiferæ antiphletiriæcum (P. Ed.), composed of litharge plaster and affa-fetida of each two parts, and of yellow wax, and strained galbanum, of each one part.

The smell of affa-fetida, and along with it its peculiar virtues, are liable to be lost and injured by long and careless keeping, but a considerable latitude may be allowed in the doing, without much danger of risk or injury to the patient. Kempfer Amet. Exot. — Murray Appar. Med. — Bergi Mat. Med. — Ph. Transact. vol. 75, &c.

ASSAI, in Geography, a town of Japan, in the province of Oomi or Omi. ASSAI, in Italian, is an adverb of augmentation generally in the superlative degree, which is added to another muntal term to increase its force: as Preffo affar, Aliter affar, very quick; Largo affar, very slow.

ASSAILANT, one that assaults or acts upon another. See Assault.

ASSAM, in Geography. See Asam. ASSAN, a town of Asia, in the province of Diarbeir, forty miles from Diarbeir.

ASSANCALÈ, a strongly fortified town of Armenia, on the river Aras, surrounded with walls, and guarded by a garrisoned citadel, in the road to Erzeroum, and a third day’s journey from it. It has hot-baths that are much frequented.

ASSANUS, in Ancient Geography, now Isser, a river of Africa, in Mauritia Cæsarica, which by its junction with other rivers formed the ancient Siwa, or present Sit. ASSAPÔRÎ, in Natural History, a name given by the people of the East Indies to a peculiar species of fly which they used in medicine, reducing it to powder, and fusing this on burning coal, that the sick person may receive the fumes of it. It is principally used for children, when they are disordered by taking cold. The fimbri of it while burning is very offensive.

ASSAR, in Geography, a river of Abyssinia, which is the southern boundary of Agossa, as Kelti is the northern. This is the largest river which Mr. Bruce saw, except the Nile; it was about 170 yards broad, and two feet deep, running over a bed of large stones, though generally through a flat country; its course is rapid, and after much rain it is fearfully passable, owing to the height of its source in the mountains of the Agossa. Its course where Mr. B. forced it was from south to north; but it soon turned to the north-east, and, after flowing five or six miles, joined the Nile. Below the ford is a cataract above twenty feet high, and eighty broad. The whole river falls in an undivided sheet of water with incredible violence and noise: but below this cataract it becomes much narrower, till it loses itself in the Nile. Bruce’s Trav. vol. iii. p. 562.

ASSARA, in Ancient Geography, a river of Africa, in Mauritania Cæsariæna, Poloeum.—Alfo, a place of Aftirs, is the department of Mopotamia. — Alfo, a river of Afgir, which discharges itself into the Mediterranean, in the Gulf of the great promontory, Poloeyi.

ASSARABACCA. See Assaraccæ.

ASSARACCE, in Ancient Geography, a people of Africa, in the interior Libya, placed by Poloei, east of mount Aranga.

ASSARIUM denotes a small copper coin, being a part or diminutive of the as.

The word is used by Suidas indifferently with κάλαμον and μυρρος, to denote a small piece of money; in which he is followed by Cujiacius, who defines σώζων, by minimus aris nummus.

The affaron, or imperial as., was worth one half-penny English. This division of the as began to be called affaron as soon as its size was reduced to half an ounce, and it was then always struck on copper. Its size regularly corresponded to that of the dupondius, and declined oil at the close of the reign of Gallienus, it became what is called small brass, and weighed only about the eighth part of an ounce. In the time of Diocletian, it was about the twentieth part of an ounce; and in that of Julianus, it was the same with a ferris, pœna, or the smallest coin, excepting the sippus, nummus. The Greek affaron kept pace with the Roman. Pinkerton’s Ed. on Medals, vol. i. p. 121.

We find mention of the affaron in the gospel of St. Matthew, chap. x. ver. 29.

ASSARLI, in Geography, a town of European Turkey, in the province of Rumania, 44 miles E.S.E. from Filippopoli. ASSARON, an ancient Jewish measure of capacity, equal to the tenth part of the ephah. Exod. xvi. 16. The affaron is the same with what is more frequently called oner or gomer.

Josephus calls it ορατός; in the Hebrew it is also written αφαρίτως. Calmet and Arbuthnot.

ASS ART, ASSARTUM, derived either from afferre, Fr. to make plain, or, as Spelman supposes, from aferse, pulled up by the roots, for it is sometimes written afferre. In Latin an offence committed in the forest, by pulling up by the roots, woods which serve as thickets and covert for the deer, and making them plain as arable land. This is the greatest trespafs that can be committed in the forest, being more than a wake. For whereas wake of the forest is but the felling and cutting of the covert, which may grow again; affar is a total extirpation. What we call affarton, is elsewhere termed t-tracking. Assart was also used for a parcel of land affarred. See Assart.

Assart-orts were those formerly paid to the crown for forest-lands affarred. Stat. 25. Car. II. c. 6. See Kent. ASSAII, in Ichthyology, a species of Balistes that inhabits the Red Sea. The body is mirculated with brown spots; and a triple row of black ones on the tail. Port. Arab. Length about six inches, brown, belly white, vent black, surrounded by a fulvous ring. The flesh of this kind is edible but inipid.

ASSASINS, in Ancient Geography and History, the name of a people of Phurnia, who inhabited the mountains of Libanus, to the north-east of the city of Tyre, and who pretended to derive their origin from the family of the Arafacide.
Arfacide, the founders of the Parthian empire. To a cor-
rupption of Arfacide into Aflaffins some have ascribed the
etymology of the appellation by which they were distingui-
shed; whilst others suppose it to have been formed from
Hussain, in reference to the piousness, which was their cus-
tomary weapon. It is said that they were a sect of Moho-
metans, who arose in the year 891, when Carnat, or Karmat,
a pretended prophet in Arabia, drew after him many follow-
ers. He failed, and laboured with his hands, and prayed
fifty times a day. He promised to re-establish the family of
Ali, and to dethrone the caliphs. He released his disciples
from the most troublesome oblations of their religion,
permitting them to drink wine and to eat any kind of food.
By this indulgence, joined to the hopes of plunder, he col-
clected a great army, and ravaged the dominions of the cal-
iph. This Carnat had a series of succourers, of whom the
most famous was Abu-Thaber or Asma-Darrah. These
Carnatians, or Karnatiens, being entangled, kept their
religion concealed, mixed themselves with the Mahometans,
and were dispersed over various parts of the east. About
the year 1090, they were settled in Peria; where Hacen, or
Al-Hafan their chief, receiving a threatening message from
the sultan, commanded one of his subjects, in the presence
of the messenger, to fling himself from the top of a tower,
and another to kill himself, which they instantly performed.
Upon which Hacen said to the messenger, "Tell your
master that I have 75,000 men ready to do as much." In
Peria and Syria, they were denominated Iffimadians; and
among the hills to the south of the Caliphan, these odious
factories maintained their power, for nearly two centuries.
Their prince, or Imam, established his lieutenants to head
and govern the colony of mount Libanus, so famous, and so for-
midable in the history of the crusaders. They had acquired
or founded ten castles in the hills above Tortofa, and posse-
ced several cities about Tyre. As these enthusiasts had po-
essed themselves of the best part of Al Jebal, in the Persian
Irak, under the conduct of Al Hafan Ebn Masbah, or Al
Hafan Sabah, as he is sometimes called, the commencement
of the dynasty of the Ismailian princes is generally placed
at this period, or the year of the Hegira 483, A. D. 1090.
The style or title adopted by these princes was "Shiikh Al
Jebal," that is, the prince of Al Jebal; or "the chief of the
mountainous country;" the province of Al Jebal being
such a country, and from this circumstance deriving its
modern name, "Kuhelian or Chufilian:" the words "Shiikh
Al Jebal," may likewise he properly rendered "the senor,
or old man of the mountain," and hence the chief or prince of
the Aflaffins has obtained the appellation of "the old man
of the mountain," amongst the writers of the history of the
Holy Wars. Al Hafan Ebn Masbah and his descendants
reigned in Al Jebal 171 years, till the whole race of them
was destroyed by the Tartar Hulaka, or Hidragon Khan,
the grandfson of Zingris, or Jenghiss Khan, who abolished
the caliphate by the reduction of Bagdad, in the year of the
Hegira 656, A. D. 1258. Gibbon says that the Ismailians of
Syria were extirpated by the Maneliches about the year 1258.
Not a vestige is left of these enemies of mankind, whose
daggers have been felt both in the east and the west, except
the term aflaffin, which, in the most odious sense, has been
adopted in the languages of Europe. With the fanaticism
of the Koran, the Ismailians had blended the Indian trans-
migration, and the visions of their own prophets; and it
was their first duty to devote their souls and bodies in blind
obedience to the vicar of God. Such was the ascendant
which their prince had acquired over his declused and fan-
tatical subjects, that they paid the most implicit deference to
his commands; effecting assassination meritorious, when
sanctified by his mandate; courted danger, and even certain
death, in the execution of his orders; and fancied, that
when they sacrificed their lives for his sake, the highest joys
of paradise were the infallible reward of their devoted obe-
dience. It was the custom of this prince, when he imagined
himself injured, to dispatch secretly force of his subjects
against the aggrieved, to charge them with the execution of
his revenge, to instruct them in every art of disgruing their
purpose; and no precaution was sufficient to guard any
man, however powerful, against the attempts of these subtle
and determined ruffians. The greatest monarchs flied
in awe of this prince of the afiffsins; and in 1192, Conrade,
marchquis of Moncerrat, a zealous crusader, fell a sacrifice
to his relentment. The prince determined to avenge the death
of former of his people who had been murdered by the in-
habitants of Tyr, then under the government of this noble-
man, employed two of his subjests for the execution of his
purpose. Those men inculcated themselves in disguise
among Conrade's guards, and openly, in the streets of
Sidon, wounded him mortally; and when they were seized
and put to the most cruel tortures, they triumphed amid it
their agonies, and rejoiced that they had been defined by
heaven to suffer in a cause so just and meritorious. The
prince of the Aflaffins himself avowed the action in a formal
narrative which he sent to Europe. In 1173, a prince of
the Aflaffins in Phencicia, sent a deputy to the king of
Jerusalem, declaring himself and his people inclined to re-
ceive the Christian religion; but the knights templars accu-
frated the deputy on his return home, and the king was
unable to chaffice or restrain them. In 1213, Louis of Ba-
vania was murdered by the afiffsins. The favours of these
afiffsins were condemned by the council of Lyons, under
 Innocent IV. in 1231. Hume's Hist. vol. ii. p. 18. Gibb
Assassins, a denomination which distinguished a fac-
tion that sprung from the followers of Judas of Galiliee,
in the Jewish war that preceded and succeeded the destruc-
tion of Jerusalem. The head of this faction was Eleazar,
the grandson of Judas the Gaulonite. For their fate at
the siege of Massada, which terminated the Jewish war, see
Massada. Of those who had previously escaped, some
fled to Alexandria, where they were at first kindly received
by their brethren; but as they excited sedition and tumult,
they were delivered up to the Romans, and 600 of them
put to death. An order was also given for slitting up the
Jewish temple at Alexandria, and the worship of it was dis-
couraged. See Gaulonites and Zealots.
Assassin, in Law, a person who kills another with the
advantage either of an inequality in the weapons, or by
means of the situation of the place, or by attacking him un
awares. For the etymology of the term, see the preceding
article.
There was a certain law of nations, an opinion received
in all the republics of Greece and Italy, whereby he that
affiliated an usurer of the supreme power, was declared
a virtuous man. At Rome, especially after the expulsion
of the kings, the law was formal and solemn, and influences
of it admitted. The commonwealth armed the hand of any
citizen, and created him magistrate for that moment. Con-
Assassins' Day, in Geography, lies on the south-east
coast of New Zealand, in the fourth Pacific Ocean.
Assassation, formed of the Latin affari', to robb, the
preparing or dethling of foods, or medicaments, in their own
juices, by an external heat, without addition of any foreign
moisture. Aflation, in respect of culinary matters, is more
frequency
ASS

frequently called roasting; and in pharmacy, fumon, or
torrefaction.

ASSAULT, in the Art of War, signifies a general attack
made by a besieging army, to become masters of an intrenched
camp, poll, or fortresses. In the latter case it is particularly
understood to take place without the advantage of any works
to screen the affillants from the fire of the garrison.

Anciently, when tactics were yet in their infancy, and
the art of besieging places bore comparatively no proportion
to that of defence, we rarely meet with instances of walled
towns entered by assault. A close blockade was generally
the measure resorted to, and the garrison were slowly
dissipated, and the patience of the besiegers exhausted, by
various writings supported for years. The sieges of
Azotus by the Egyptians, of Nineveh by the Medes and
Babylonians, and of Babylon by Darius Hykaspes, where
treachery alone prevented a resistance equally tedious with
that of the two former places, are evidences of the almost
inurable difficulties attending the reduction of strong holds
in earlier days.

The Greeks, previously to the era of Alexander, had very
imperfect notions of assaulting towns. The Carthaginians
first demonstrated the possibility of shortening sieges by
the summary expulsion of retracted and furious attacks. Thus
they became masters, in the fifth century B. C., of Himera
and Selinosis in Sicily; and, nearly two hundred years after,
of Saguntum in Spain. The cruelties they executed against
the unfortunate inhabitants were afterwards amply retaliated
upon themselves by the Romans.

That warlike nation was employed for ages in almost
continual wars before they practised this method of attack.
Surprise, not an open and vigorous assault, made them
matters of Vei. In the first Punic war, Lilybaeum for
years baffled their utmost efforts, though they had then united
to their own fylem of tactics, whatever was most new and
valuable in that of the Greeks. The storming of New
Carthage by Scipio is one of the first, and most memorable
examples of a successful assault in the Roman annals. To
what perfection they afterwards carried this branch of military
science, the capture of Athens by Sylla, of Avaricum
by Caesar, and of Cremona and Rome itself by the armies
of Vepafian, are melancholy witnesses.

In the dark period of the decline of the empire, the
barbarians who successively invaded it only carried on their
operations against fortified places by continued assaults, which
were commonly successful, nor were the superior tactics of
the Romans then capable of retarding their fury.

Alike impetuous and irresistible, the Mogul destroyers,
who, under Jengis Khan and his successors, depopulated the
fairest regions of An, mocked the ordinary rules of war.
A place which had once refused capitulation, never enjoyed
a repetition of the offer. Assault succeeded to assault with
amazing rapidity, and no repulse was allowed to the devoted
garrison, till weakened beyond the power of further
resistance, they were involved, with the innocent inhabitants,
and the place itself, in one common destruction.

With the Europeans of the middle ages, the science of
attack lofs much of its former superiority; and the cattle
of a petty baron frequently baffled the endeavours of the most
powerful monarch.

The invention of gunpowder offered new advantages to
the art of besieging; but general assaults have become
ininitely more dangerous against ramparts mounted with
artillery. Even after the requisite breach is made, it is
absolutely necessary to destroy the works whole fire, on
either side, flank and protect the point of attack. Before
therefore a storm is attempted, the besieging general should
afoertain that his troops are exposed to no other fire than the
garrison are able to maintain from the front of the breach.

Going to the fancied advantages a regular garrison were
supposed to possess behind good fortifications, the rules of
war formerly required a governor to hold out in these assaults
before he surrendered. But such rigid notions have been by
degrees disregarded. Few commanders refuse, by maintaining
a fortress to the last extremity, to expose their troops to an
useless slaughter, or the inhabitants to the murder and
pillage inevitably the attendants of a storm. At Glagow,
carried by the Prussians in 1714, and Bergen op Zoom, by
the French in 1747, success was the effect of a coup
de main than a regular assault.

The Turks, however, materially differ from us on this
head. It is with them a maxim of religion, never to
surrender to Christians a place where they have once
possessed a mosque. They, therefore, hold out to the last.
Severe punishment has, indeed, attended this obstinacy.
Bender, Ockzakov, and Izum, are memorable for the unceasing
defence of these castles exercised by Russian severity, and have
been adorned with bloody laurels the names of Parn, of
Potemkin, and of Suwarow.

The capture of Warsaw, in 1794, is a fresh instance
of the summary methods observed by the latter general in
attacking towns, and of the lamentable consequences of
ineffectual resistance to a barbarous and unforgiving
enemy.

During the late war, an incessant cannonade and bom-
bardment have been chiefly substituted by besiegers to the
fystem of assault. Pavia indeed, with some smaller places
in Italy, suffered, in 1796, all the horrors of a storm, from
the French army, under general Buonaparte. The year
1799 also furnishes four remarkable instances: 1. The
attack of Naples (January 22), by general Championet, to
which the rhapsody of the Lazzaroni madly expounded
themselves; but memorable for the daring and desperate, though
useless, resistance, maintained by them against regular
troops. 2. The storming of Jaffa by Buonaparte (Feb.),
the garrison of which place, 3,500 strong, was nearly
expelled, presents a striking and frightful picture of Turkish
obstinacy. 3. That of Acre (May 8) where the French,
after having penetrated within the town, were eventually
repulsed with great loss, is the more worthy of notice, from
its having effectually checked the adventurous progres of
Buonaparte on the side of Syria. 4. The assault of
Zurich (Sept. 21) by the republican army of Helvetia,
and which may with more propriety be denominated a
battle, displays so much ingenuity in the complicated move-
ments directed by general Massena, all of which were
inseparably connected with the main point of attack, such
precipice, firmness, and bravery in the execution, and such
importance in the consequences, as to demand a separate
notice elsewhere. It will here be sufficient to observe, that
the Russian camp before Zurich was forced, the town
itself carried fowrd in hand, and that this event gave to
decided a superiority to Massena, as to be immediately
followed by a precipitate retreat of the allied forces from
Switzerland.

Affillants, as fuch, acquire a very considerable superiority
over those they attack. This superiority, says an excellent
writer on tactics, may be derived from two causes: the first
a phical one, viz. that air of boldness, peculiar to affillants,
cannot but alarum and intimidate an enemy who fees
that no difficulty can stop them; the second is, that the
affillants can command as much time as they please, to take
their measures for overcoming all obstacles that can be thrown

ASSAULT, Affluus, or Insulius, in Law, an offer or attempt to hurt the person of another.

Or, it is a violent injury offered to a man's person, of a larger extent than battery, because it may be committed by only offering to give a blow, without touching him, as if one lifts up his cane, or his fist, in a threatening manner, at another; or strikes at him, but miffes him; this is an assault described by Finch (l. 262.) to be "an unlawful setting upon one's person." But no words whatsoever, be they ever so provoking, can amount to an assault, notwithstanding many eminent opinions to the contrary. 1 Hawk. P. C. 62. § 1. Assault does not always imply a blow; for, in trespass for assault and battery, a man may be found guilty of the assault, and excused of the battery. 1 Hawk. P. C. 263.

But every battery includes an assault.

For an assault, the offender is subject both to an action at the suit of the party, in which he shall render damages; and also to an indictment at the suit of the king, in which he shall be fined according to the heaviness of the offence. 1 Hawk. 263.

The assaulting of a person with offensive weapons, with a design to rob (though no robbery ensued), is punished with transportation for seven years. 7 Geo. II. c. 21. Assaulting in the street or highway, with intent to spoil people's clothes, and fo spoiling them, is felony and transportation, by 6 Geo. i. c. 23. fec. 11. And the assault of a privy counsellor in the execution of his office, is felony without benefit of clergy, by 9 Ann. c. 16. Assaulting or threatening a counsellor at law, or attorney employed in a cause against a man, or a juror giving verdict against him, or an adversary for suing him, &c. is punishable on an indictment, by fine and imprisonment, for the contempt. 1 Hawk. 58.

There are other assaults to which peculiar punishments are annexed: thus, flat. 5 Hen. IV. c. 6, and 11 Hen. VI. c. 11. render assaults on members of parliament more than usually penal, upon non-surrender on proclamation. Stat. 9 Edw. 11. R. i. c. 2. gives a double criminal process against those who assault clergymen, indictment for the temporal offence, and precept in the ecclesiastical court for the spiritual one. By flat. 5 Eliz. c. 4. servants, assaulting their master, mistreat, or overbear, may be imprisoned twelve months, on conviction before two justices. By 9 Ann. c. 14. § 8. from to assault, beat, or challenge another, on account of money won by gaming, incurs forfeiture of goods, and two years imprisonment. By flat. 9 Geo. I. c. 22. to assault another by wilfully shooting at him, is felony without clergy. By flat. 12. Geo. I. c. 34. assaulting a master woolcomer or weaver, &c. for not complying with the demands of workmen, is felony and transportation for seven years. In many cases a man may justify an assault: the defendant may justify "nullius manus impoifit," in defence of his person or goods; or of his wife, father, mother, or master, or for the maintenance of justice. Bract. 9. E. 2. 35 H. VI. c. 51.

There are also other cases in which a man may be justified: as, of an officer reformed in arresting a man by warrant, of a parent reprimanding his child, or a master his servant, or a schoolmaster his scholar, or a gaoler his prisoner, or even a husband his wife for reasonable and proper cause, &c. Hawk. P. C. 238.

ASSAY, in Metallurgy, the proof or trial of the goodness, purity, value, &c. of metals, and metalline fabhances.

In ancient latitudes, this is called touch; and those who had the care of it, keepers of the touch. Under Henry VI. divers cities were appointed to have touch for wrought silver plate. 2 Hen. VI. c. 14. By this one might imagine they had no better method of assaying than the simple one, by the touch-tone; but the case is far otherwise. In the time of king Henry II. the bishop of Salisbury, then treasurer, considering that though the money paid into the king's exchequer for his crown-rents, did answer numero & ponderes, it might nevertheles be mixed with copper or brass; whereas a confession was made, called the trial by combustion; which differs little or nothing from the present method of assaying silver. See a description of it in the Black Book in the Exchequer, written by Gervase of Tilbury, c. xxi. The trial is also there called affirmam, and the officer who made it is named fustor. Vid. Lownd. Eff. Amend. Silv. Coin. p. 5. & 155.

The method still in use of assaying gold and silver, was first established by an act of the English parliament, in 1354, Anderson's Com. vol. i. p. 187.

ASSAY, or Effay, Effayer Fr. Prueben Germ. The term assay in its most extended signification, means a species of analysis applied to metallic ores or alloys, the object of which is to ascertain the quantity and proportion of only one of the ingredients of the mass. Hence it differs from analysis in general, as this takes notice of all the ingredients: thus, in the assay of copper ores, the sole object is to know the proportion of pure metallic copper which a given weight of the ore can be made to yield; disregarding all the other component parts, such as the fulphur, iron, flex, &c. or rather confounding them together under the general term impurities. The same mode of inquiry takes place in the assay of a mixture of gold, or gold and silver, with copper, lead, tin, or any other of the inferior metals, the whole attention being directed to the proportion of fine, or of gold and silver contained in the alloy. For the various methods of conducting the assays, the reader is referred to the several metals; in all which articles the second section is devoted to the assay and analysis of the metal treated of. Gold and silver, from their superior commercial value, from their being the universal medium of exchange throughout the civilized world, and from their being the materials of the most costly and splendid utensils, ornaments, and articles of furniture, have demanded and obtained a greater accuracy in their assay than any of the other metallic bodies. The method of conducting it has been a subject of various legislative regulations; last from time immemorial been entrusted to a distinct craft or profession, and has more than any other process engaged the attention of some of the most able and accurate chemists of the present as well as of former ages. For these reasons, under the articles Gold and Silver, we shall enter at length into the consideration of this important subject. It was at first our intention to have introduced in this place all the matter relative to the art of the assay, but by such an arrangement, much unnecessary repetition would have been required of information that properly belongs to the articles Assay-Balance, Cepel, Cupellation, Coin, Assayer's Furnace, &c.

ASSAY-MASTER, an officer, under certain corporations, entrusted with the care of making true touch, or assay, of the gold and silver brought to him; and giving a just report of the goodnes or badnes thereof.

Which is the assay-master of the mint in the Tower, called also assayer of the king.

The assay-master of the goldsmiths' company is a fort of assayer-warrant, called also a touch-warrant, appointed to survey, assay, and mark all the silver-work, &c. committed to him.—There are also assay-masters, appointed by statute, at York, Exeter, Bristol, Chester, Norwich, Newcastle,
and Birmingham, for affaying wrought plate. The assayer is to retain eight grains of every pound troy of silver brought to him; four whereof are to be put in the fire, or box of deal, to be re-assayed the next year; and the other four to be allowed him for his wages and frillings. 12 and 13 W. III. e. c. p. 3. No. 9.

Note. The number of penny-weights set down in the assayer's report, is to be accounted as per pound, or so much in every pound of twelve ounces troy. For every twenty penny-weight, or ounce troy, the silver is found by the assayer to be worth than standard, or flering, six-pence is to be deducted; because every ounce will cost so much to reduce it to standard goodness, or to change it for flering.

In gold, for every carat it is set down to be worse than standard, you must account that in the ounce troy it is worse by so many times 3. 8 d. And for every grain it is set down worse, you must account it worse by so many times 11 d. in the ounce troy. And for every half grain 5 d. 3/4; for so much will cost to make it of standard goodness, &c.

Touchstone of Gold and Silver Ware, &c. p. 41, &c.

Assay-Balance, a balance used in the operation of assaying. See Balance.

Assay of Weights and Measures, signifies the trial or examination of common weights and measures, by the Clerk of the market.

Assche, in Geography, a town of France, in the department of Dyle, and chief place of a canton, in the district of Bruxelles. The place contains 5768 and the canton 18,667 inhabitants; the territory includes 140 kilometres and 19 communes.

Assesse, a town of France, in the department of the Orne, and chief place of a canton, in the district of Evron, one league from Evron. Assesse, a town of France, in the department of the Sarthe, and chief place of a canton in the district of Fresney-le-Viicome, eight miles S.E.W. of Alencon.

Assecoma, in Ancient Geography, a place of Spain, between Pris and Brevis. Ith. Anton.

Assectator, in Entomology, a species of Ichneumon that inhabits Europe. It is black; abdomen falcate, with three russet spots on each side; posterior flanks clavate and black. Fabricius.

Assed-Abad, in Geography, a small town of Persia, towards Amanad.

Asselen, a town of Germany, in the circle of Weilphalia, nine miles S.E. of Paderborn.

Asseo, a town of Persia, in the province of Farshian, on the north coast of the Persian gulf, 47 leagues south of Schiras.

Asellyn, John, in Biography, a painter, was born in Holland about the year 1610, and after receiving his education under Isiah Vandenh-Velde, a battle-painter, at the Hague, travelled into France and Italy. He studied at Rome, and particularly imitated the manner of Tintoretto. His hands and fingers were crooked, and from this circumstance he was denominated by the Flemish students 'Krabbate.' After improving his time during his residence at Rome, he passed through Lyons on his return, and there married the daughter of a merchant at Antwerp, whom he brought with him to Amsterdam in 1645. His countrymen received him with applause, and from him the Dutch painters first acquired the idea of imitating the natural manner of colouring landscape, for which Claude Lorrain has been so much admired; and abandoning the fombré style, with the prevalent blue and green tints of Paul Brill and Bruegel. Alleyn was in great reputation at Amsterdam, and his paintings, consisting of history pieces, battles, and landscapes exhibiting antiquities, and also men and animals, were purchased at a high price; they were distinguished by their correctness and admirable brilliance of colouring; and a set of 24 of his landscapes and ruins has been engraved by Persoon. Alleyn died at Amsterdam in 1650. D'Argenville, Vie des Peintres, Gen. Bio.

Assem, or Great Ardrab, in Geography, a town of Africa, on the Slave coast, the capital of the kingdom of Ardrab. It was formerly the residence of the Kings of Ardrab, and five or six leagues in circuit. The streets are very wide, and each house surrounded by its own rampart, as a security against fire. The walls are of mud, but high and thick, and also compact as if they were formed of stone and lime. The gates are defended by deep ditches in the middle, which are crossed by draw-bridges, and near each gate is a guard-room for the convenience of the officers and soldiers. The river Euphrates compasses one half of the city. The buildings are of clay, covered with straw, and the streets are kept in good order. The people are numerous, and the women are richly dressed. In the conquest of the kingdom of Ardrab by the king of Dahomey, in 1724, this city suffered very much. It is situated 16 leagues from the sea, and to the north-east of Little Ardrab.

Assemblage, the joining, or uniting, of several things together; or, the things themselves to joined or united. The assemblage of two bones for motion, is called articulation. Carpenters and joiners have various kinds and forms of assemblage; as with mortises and tenons, with dovetails, &c. See Dovetail, Mortise, &c.

The Europeans admire the carpentry of some Indian, where the assemblage is made without either nails or pins. Hereafter.

Assemblage is also used in a more general sense, for a collection of several things, to disposed together, as that the whole has an agreeable effect. It is with discourse as with bodies, which owe their chief excellency to the just assemblage and proportion of their members.

Assemblage, formed of adscenders; compounded of ad, and joint, together; a meeting of several persons in the same place, and with the same common design. Assemblies of the clergy are called convocations, synods, and councils of the clergy; though that annual one of the Kirk of Scotland retains the name general assembly, &c. The assemblies of judges, &c. are called courts, &c. The assemblies of the Roman people were called comitia.—The assembly of a preacher, &c. is his audience. The academies have their assemblies, or days of assembly.

Under the Gothic governments, the supreme legislative power was lodged in an assembly of the lords of the kingdom, held annually for the like purposes as our parliament. See Parliament.

Assemblage, General, in Ecclesiastical History, is an assembly poling the highest authority in the church of Scotland, and consisting of a certain number of ministers and ruling elders delegated from each presbytery, and of commissioners from the universities and royal boroughs. A presbytery, composed of fewer than 12 parishes, sends two ministers and one ruling elder to this assembly; if it contain between 12 and 18 ministers, it sends three of these, and one ruling elder; if it contain between 18 and 24 ministers, it sends four ministers and two ruling elders; and of 24 ministers, when the presbytery consists of so many, it sends five with two ruling elders. Every royal borough deposes one ruling elder; Edinburgh two; and their election must be attested by the kirk-kession of their respective boroughs. Every university sends one commissioner from its own body. The commissioners are chosen annually six weeks before the meeting of the assembly; and the ruling elders are often men of
the full eminence in the kingdom for rank and talents. In this assembly, which met once a year, the king presided by his commissioners, who are always noblemen; but he has no voice in their deliberations. Appeals are brought from all the other ecclesiastical courts in Scotland to the general assembly; and in questions purely religious, no appeal lies from its determinations. The first general assembly of the church of Scotland was held in the year 1560; but it bore, says Dr. Robertson (Hist. Scot. vol. i. p. 251.), all the marks of an infant and informer society. The members were few, and of no considerable rank; and, of course, a convention so feeble and irregular could profess no great authority; and conscious of their own weakness, the members put an end to their debates, without venturing upon any decision of much importance. By degrees, however, it acquired dignity, authority, and permanence.

Assembly. General, of the Jewish Rabbits. See Aqdena.

Assembly of Divines, is the name given to an association of ministers and others, summoned by an ordinance of parliament, in the year 1643, to meet at Westminster, "for settling the government and liturgy of the church of England, and for vindicating and clearing the said church from false aspersions and interpretations." This assembly comprised of 121 divines, and 30 laymen, "celebrated in their party," says Mr. Hume, "for piety and learning." The several parties in this assembly were composed of Presbyterians, Erastians, and Independents. By their advice, alterations were made in the thirty-nine articles, the first fifteen of which employed their committee for ten weeks; and these alterations chiefly respected the doctrinal articles, and were designed to render their sense more express and determinate in favour of Calvinism. It was of still greater importance, that they utterly abolished the liturgy, and, in its stead, established a new directory for worship, by which, suitably to the spirit of the puritans, the utmost liberty, both in praying and preaching, was indulged to the public teachers. They also agreed in introducing and enforcing the solemn league and covenant, by which episcopacy was abjured; and a national engagement, attended with every circumstance that could render a profane facia and obligatory, was entered into with the Scots, never to suffer its re-admission. All these measures, says Mr. Hume, flamed little spirit of accommodation had the government, and the king's commands were not surprised to find the establishment of preachers, and the directory positively demanded, together with the subcription of the covenant, both by the king and kingdom. This assembly published till Feb. 22, 1645, about three weeks after the king's death, having sat five years, six months, and twenty-two days, in which they had 1163 sittings. They were afterwards changed into a committee for the examination of such ministers as presented themselves for ordination or induction into livings, and met once a week, till March 25, 1652; when the long parliament being turned out of the house by Oliver Cromwell, they broke up without any formal dissolution. The works of the assembly, besides some letters to foreign churches, and occasional admonitions, were 1. "Their humble advice to the parliament, for ordination of ministers, and settling the presbyterian government." 2. "A directory for public worship." 3. "A confession of faith." 3. "A larger and shorter catechism." 5. "A review of some of the thirty-nine articles." 6. "When poverties," says Mr. Neal, "shall impartially review this assembly of divines, and consider the times in which they lived, they will have a just veneration for their memory; for though their sentiments in divinity were in many influences too narrow and contracted, yet, with all their faults, amongst which their persecuting zeal for religion was not the least, they were certainly men of real piety and virtue, who meant well, and had the interest of religion at heart; and most of them possessed as much learning as any of their contemporaries: the names of Lightfoot, Sheldon, Gataker, Greenhill, Arrowmith, Twisse, bishop Reynolds, Wallis, &c. will always meet with esteem from the learned world; and had they not grappled at coercive power or jurisdiction over the consciences of men, their characters would have been unblotted." Lord Clarendon (vol. i. p. 503.) allows, "that about twenty of them were reverend and worthy persons, and episcopal in their judgments: but as to the remainder, they were but pretenders to divinity; some were infirm in their lives and conversations; and most of them of very mean parts and learning, if not of scandalous ignorance, and of no other reputation than of malice to the church of England." Mr. Lachard confesses, that his lordship has, perhaps with too much severity, said, that none of these divines were infamous in their lives and characters; but Mr. Baxter, who knew most of them, says, "they were men of eminent learning, godliness, ministerial abilities, and fidelity; and being not worthy to be one of them myself," says he, "I may more fully speak the truth, which I know, even in the face of malice and envy, that as far as I am able to judge by the information of history, and by any other evidences, the Christian world, since the days of the apostles, has never had a synod of more eminent divines than this synod, and the synod of Dort."

The divine right," says Mr. Neal, "of the presbyterian government, first threw them into heats, and then divided them; engaging them first with the parliament, and then with the Independents and Erastians. Their opposing a toleration, raised them a great many enemies, and caused a secession in their own body; for after they had carried the question of "divine right," the Independents and Erastians defected them, after which they found it very difficult to muster as many as would make a house. Had the parliament dissolved them at this juncture, they had separated with the Independents, and the business of the church was translated to the provincial assemblies. Hume's Hist. vol. vi. p. 22. Neal's Hist. Pur. vol. p. 25. &c. p. 32.

Assembly of the campus Maris; or Mars, of the field of Mars, or May; see Field of Mars, &c.—Rebellious assembly; see Unlawful assembly; see Unlawful.

Assembly is particularly used in the beau-monde, for a slated and general meeting of the polite persons of both sexes, for the sake of conversation, dancing, and play. Assembly is also used in the Military Art, for the second beat of the drum, being that before the march. On hearing this, the soldiers shake their tents, roll them up, and then stand to their arms.—The third beating is called the march, as the first is called the general.

Assembly. Azmon, or Azemon, in Ancient Geography, a city in the wilderness of Moab, south of the tribe of Judah, 1 Sam. xxxvii. 25. Joth. xv. 4. Also, an encampment of Israel in the desert. Azmon was the nearest city to Egypt, south. Numb. xxxiii. 29. xxxiv. 45. 5.

Assembly, in Geography. See Ezem.

Asseen in Geography. See Enze.

Assene, a town of Flanders, one mile south-west of Sais de Ghent. By the new arrangement, it is referred to the department of Ecaussinnes, and is the chief place of a canton in the district of L'Ecluse. The place contains 3120, and the canton 16,335 inhabitants; the territory includes 120 kilometres and 7 communes.

Assenepowels, a lake of America, westward of 6 Chirithanux.
Chrislinkauksee, through which its waters run into Allaya river, in New South Wales.

**ASSER LOC.**

A city of Germany, in the circle of the Upper Rhine, and county of Sana Reddeloh, at the confluence of the Wetter and Nech, eleven miles north-west of Düsseldorf. N. lat. 51. 70. 30. E. long. 8. 59.

**ASSENS.** A city of Danmark, left in the west bank of the island of Amn, with a good harbour on the Little Belt, chiefly inhabited by fishermen. The pottage from bees, across the Little Belt, to Ahua found, in the dacha of Sljvick, is nine miles.

**ASSNS Regin.** See Sine, &c.

**ASSNS Patris, Dower ex.** See Dower.

**ASSSNT,** Assens, an agreement or acquiescence of the mind to something proposed or affirmed. — Thus, to affirm to any proposition, is to allow it to be true, or to perceive its truth.

Affirm is distinguished, by faith, into implicit, or blind; and explicit, or seeing, &c. Others distinguish it into actual and habitual.

**Assent, actual,** is a determination of the mind, arising from the perception of the truth of any proposition.

**Assent, habitual,** consists in certain habits of believing or acquiescing, induced in the mind by repeated acts.

To this belongs faith, which is an assent arising from the authority of the person who speaks. Such assent is opinion, which is defined as an assent of the mind, even formaline oppositi, &c.

Father Melchertus says it is done as an axiom, or principle of method, never to allow anything for truth, from which we can ever disaffort without some secret reproach of the town. For Mr. Hume, in his Treatise of Human Nature (vol. i. p. 172, &c.), has given us a new theory of assent or belief in general: a theory which is as well supported with his hypothesis as any ideas, and seems to be a natural consequence of it, and which at the same time is the only belief that we feel in human nature to perfect perspicuity. According to this writer, "an opinion or belief may be most accurately defined, a lively idea related to or associated with a pretext for principle." Upon this notion of belief a great part of his theory is founded; and hence he deduces what he calls his hypothesis, that belief is more properly a part of the subjective than of the cognitive part of our nature.

Dr. Reid has lately observed, in his examination of this theory (Ed. on the Intellectual Powers of Man. p. 253.), that the belief of a proposition is an operation of the mind, of which every man is conscious; and what it is he understands perfectly; though, on account of its simplicity, he cannot give a logical definition of it. If he compares it with the strength or vividness of his ideas, or with any modification of ideas, they are so far from appearing to be one and the same, that they have not the least semblance. That a strong belief and a weak belief differ only in degree, we may easily comprehend; but that belief and no belief should differ only in degree, no man can admit who understands what he speaks; for this in reality is to say, that something and nothing differ only in degree, or that nothing is a degree of something. Every proposition that may be the object of belief, has a contrary proposition that may be the object of a contrary belief. The ideas of both, according to Mr. Hume, are the same, and differ only in degrees of vivacity: that is, contraries differ only in degree; and so pleasure may be a degree of pain, and hatred a degree of love. Such are the absurdities that follow from this doctrine; but it is needless to trace them, as none of them can be more afforded than the doctrine itself. Mr. Hume, in the third volume of his Treatise of Human Nature, endeavours that his theory of belief is very objectionable, seems to home measure to extract it; but he still appears to be of opinion, that belief is only a modification of the idea, though without a proper terminology to express that modification. He therefore adapts a new terminology to explain that modification; such as "apprehending the idea more strongly, or taking further hold of it." But this is merely a change of terms which have no specific difference; and whatever modification of the idea he makes belief to be, whether in vividness or in a stronger apprehension of it, the hypothesis, which makes perception, memory, and imagination to be different degrees of that modification, is changeable with the time and duties already mentioned.

Dr. Hartley's theory on this subject, though not so intelligibly expressed, is not so different from that of Mr. Hume; and it is liable to similar objections. "Affirm and differ," says this writer (Observations on Man. p. 171, ed. 1791.), "whatever the precise and particular nature may be, must come under the notion of ideas, being only those very complex internal feelings, which adhere by association to such clusters of words as are called propositions in general, or affirmations and negations in particular." Accordingly, he distinguishes affirm, and of course its opposite, differ, into two kinds, rational and practical. Rational affirm to any proposition may be defined a readiness to affirm it to be true, proceeding from a close association of the ideas suggested by the proposition with the idea, or in trial feeling, belonging to the word truth; or of the terms of the proposition with the word truth. Rational differ is the opposite to this. This affin, he adds, might be called verbal; but every person imposes himself always to have sufficient reason for such readiness to affirm or deny, he prefers the term rational. Practical effect is a readiness to act in such manner as the frequent vivid recurrency of the rational effect disposes us to act; and practical differ the contrary. Practical effect is therefore the natural and necessary consequence of rational, when sufficiently impressed. For his model of investigating the causes of both kinds of affin, and of accounting for them on the principles of association, we must refer to his work De Jure.

For a further account of this subject, with regard to the reasons or principles on which those affin are founded, and the various measures and degrees of it, see Demonstration, Evidence, Faith, Judgment, Knowledge, Probability, and Harmony. See his Axioms, Matrices, and Principles.

**Assent Royal.** See Royal.

**ASSER.** or Asserius Mensenseis, in Biography, an English divine of the ninth century, was a native of St. David's in Wales, where he assumed the monastic habit among the Brethren. According to Dr. Cave, he was a relation, and Henae says, nephew, to Affries, archbishop of St. David's. Having made a considerable progress in learning under John Scotus Lignana, he was invited to court by King Alfred, and among other preferments, obtained the bishopric of Sherborne. Dr. Cave informs us, that Alfred, by his advice, founded the university of Oxford; but the time of its establishment is a subject of dispute. After writing "The Life of Alfred," first published by archbishop Parker in the old Saxon character in his edition of Waltham's History, printed at London, in folio, in 1734; and republished in a collection of English historians by Cambell, at Frankfurt, in folio, in 1652; and again by Mr. Wile, at Oxford, in 8vo, in 1722. Nicholison, in his "Historical Library," observes, that Alfred's
ASSESSMENT, in a Military Service, signifies a certain rate which is paid by the county-treasurer to the receiver-general of the land-tax, to indemnify any place for not having raised the militia; which sum is to be paid by the receiver-general into the Exchequer. The sum to be assembl'd is four pounds for each man, where no annual certificate of the state of the militia has been transmitted to the clerk of the peace; if not paid before June yearly, it may be levied on the parish officers. Such assessment, where there is no county rate, is to be assembl'd in the same manner with the poor's rate.

ASSESSOR, formed of ad, to, and sols, siff, an inferior or subordinate officer of justice, chiefly appointed to aid the ordinary judge with his opinion and advice. In this sense, the matters in chancery are assessor of the lord chancellor. There are two kinds of assessors in the Imperial chamber, ordinary and extraordinary. — The ordinary are now in number forty-one, whereof five are elected by the emperor, viz. three counts or barons, and two jurisconsults, or civil lawyers. The electors appoint ten, the six circle eighteen, &c. They act in quality of councilors of the chamber, and have salaries accordingly.

ASSESSOR is also used for a person who assembles or lays assessments of taxes and other public duties.

In this sense, assessor, among us, are inhabitants of a town or village elected by the community to assess or settle the taxes and other impositions of the year, to fix the proportion which each person is to bear, according to his estate, and to see the collection made. These are also called in our law offices, by the flat. 16 & 17 Car. II. Two inhabitants in every parish were made assessors for the royal aid.

ASSESUS, in Ancient Geography, a town of the Milians, in which was a temple of Minerva Assennia, which was burned by the flames which were driven thither by the wind. Herodot. i. c. 19.

ASSETs (Fr. asse, i. c. fuitis, enough), in Law, signify goods enough to discharge that burden which is cast upon the executor or heir, in satisfying the debts and legacies of the testator or ancestor. Boc. tit. Assets. Assets are real or personal; where a man hath lands in fee-simple, and dies testate thereof, the lands which come to his heir are assets real; and where he dies possessed of any personal estate, the goods which come to the executor are assets personal. Assets are also divided into assets per defect and assets inter mains; assets per defect is where a person is bound in an obligation, and dies seized of lands which descent to the heir, the land shall be assets, and the heir shall be charged as far as the land to him descended will extend: assets inter mains is when a man indebted makes executors, and leaves them sufficient to pay his debts and legacies; or where some commodity or profit arises to them in right of the testator, which are called assets in their hands. Term. de Ley, 56, 57.

As to assets by descent, it is to be observed, that by the common law, if the heir had hold or aliened the lands which were assets before the obligation of his ancestor was put in suit, he was to be discharged, and the debt was lost; but by the Act 5 W. & M. c. 14. made perpetual by 6 Will. III. c. 14, the heir is made liable to the value of the land by him sold, in action of debt brought against him by the obligee, who
ASS

shall recover to the value of the said land, as if the debt was the proper debt of the heir; but the land which is sold or divided come fell before the action brought, shall not be liable to execution upon a judgment recovered against the heir in any such action. As by lit. 29 Car. II. c. 3, s. 12, lands of 'reçay que truff' shall be affets by defendant; and by the same Art. 12, affets par autre vie shall be affets in the hands of the heir, if they come to him by reason of a special occupancy; and where there is no special occupant, they shall go to the executors and administrators of the party that had them by virtue of the grant, and shall be affets in their hands. When a man binds himself and his heirs in a bond, and dies leaving issue two sons, if the eldest son enters on the lands by descent as heir to the father, and dies without issue; and then the youngest son enters, he shall be charged with affets as heir to the father. Dyer, 568. Lands which come to the heir by purchase shall not be affets. 1 Danv. Abr. 577. A possession in an estate for life or years shall be affets, and a remainder except upon the determination of an estate for life is affets, and ought to be pleaded specially by the heir. An adowment is affets, but not a presentation to a church actually void, which may not be held. Co. Lit. 374. Lands by descent in ancient demesne will be affets in debt; but a copyhold estate depending on an heir is not affets; nor is any right to an estate affets, without possession. Danv. 577. An annuity is no affets, for it is only a choate in action. Equity of redemption of an estate mortgageed, and a term for years to attend the inheritance, are affets.

Ass are affets to pay debts, notwithstanding the intent of the executor to the devise of them. 1 Litt. Abr. 99. Affets in the hands of one executor, are affets in the hands of others; and if an executor dies in the hands of the testator in any part of the world, he shall be charged in respect of them.

6 Rep. 57. In actions against executors, the jury must find the value of the affets; for the plaintiff shall recover only according to the value of the affets found. 1 Rol. Rep. 58. A special judgment against affets only shall have relation to, and bind the lands from the time of filing the original writ or bill. Carth. Rep. 245.

Asseveration, an earnest affirmation, or avouching.

Assheton, William, in Biographists, an English episcopal divine, was born at Middleton in Lancashire, in 1611, and educated at Brasenose college in the university of Oxford. Distinguished by his application and proficiency in various parts of learning, he became a fellow of that college in 1637, and in 1643 was honoured with the degree of doctor in divinity. Besides other preferments to which he was advanced, he was presented to the rectory of Beckenham in Kent, in 1646. He was conscientiously and zealously attached to the church in which he officiated, and faithful and exemplary in the discharge of the duties of his profession. While he was an upright and able advocate for the established religion, he was no less affident in inculcating, from the pres as well as from the pulpit, the indispensable obligations of morality and practical religion. In the present age, however, his "Treatise against Toleration," and his "Possibility of Apparitions," written in defence of them, will not be regarded as evidences of the liberality of his spirit, and the soundness of his judgment. The former, under the title of "Tolerance hath proved the doom of," was published at Oxford, in 1672, 4to.; and his book intitled, "Causes of Secaud and Perfection, &c. to the same purpose," was published at London, in 1674; and his "Possibility of Apparitions" was occasioned by the story of Mrs. Vale, who died at Dover, and was said to have appeared to her friend Mrs. Bargrave at Canterbury, and published in 1706. This story has been since prefixed to "Debates on Death." In 1635, Dr. Ashteden, who was a strenuous advocate for monarchy, wrote "The Royal Apology," in defence of the doctrine of absolute government in kings; and after the revolution, he wrote a piece in defence of king William and queen Mary, intituled, "A Seasonable Vindication of their present Majesties," in which he declared to the public the reasons which induced him to swear allegiance to them. He also wrote several tracts against popery, and in vindication of the Trinity; and various pieces of a practical nature. Dr. Ashteden claims peculiar commendation and respect as the first projector of the scheme for providing a maintenance for clergyman's widows and others, by a nature payable out of the inercess' company. To this scheme he devoted much attention, and after contending with many difficulties and discouragements, he had the pleasure of succeeding. An "Account of the Rite, Progress, and Advances of the proposal, &c." was printed in 1713. The plan, however, was not founded on a sufficient acquaintance with the doctrine of annuities; and the society of course failed in making good its proposals. Ashteden having employed his time and talents in promoting the interests of truth, according to his views of it, and the cause of virtue and humanity, died at Beckenham, in 1711, in the 70th year of his age. Gen. Dict. Bioit. Brit. 

Assideans, or rather Hamideans, in Antiquity, a sect among the Jews; thus called from the Hebrew אסידאנים, merciful, righteous. 1 Mac. ii. 42. vii. 15. Ecclesiast. xlv. 12.

Dr. Prideaux says (Comp. p. ii. book iii. vol. iii. p. 237.), that after the settling of the Jewish church in Judea, or the return from the Babylonish captivity, there were two sorts of men among the members of it: the one contented themselves with the written law of Moses, and were called Sadikins, or the righteous; and the others superadded to the law the constitutions and traditions of the Elders, and other religious observances, which they voluntarily regarded by way of supererogation, and being considered as polishing a degree of holiness superior to that of the others, they were denominated Chosideans, or the pious. From the former were derived the sects of the Samaritans, Sadducees, and Karaites; and from the latter, the Pharisees, and Essenes. These Alldens, who were men of great value as well as eminently zealous for the law, joined Mattathias and his company in the fallacies of the mountaine, as soon as Antiochus was returned to Antioch, and determined to fight with him for the law of their god and the liberties of their country.

Assiduous, Signum Assiduus, in Medicine, a symptom which usually attends a disease, but not always. Thus a dry rough tongue, thirst, and watching, are assiduous signs in an ardent fever. In this sense, assidius differs from pathogeneses, which are inseparable from the disease, &c.

Assiduous, or Assidius, among the Romans, denoted a rich or wealthy person.

The word in this sense is derived from assis, q. d. a man.

Hence we meet with assiduous furtives, assidui furtiujiores, answering to what the French now call city furtives or securities, citations bourgeois.

When Servius Tullius divided the Roman people into five classes, according as they were assessed or taxed to the public, the richer sort, who contributed affes, were denominated assidii; and as these were the chief people of business, who attended all the public concerns, those who are diligent in attendances came to be denominated assidui.

Assidus was also used for volunteers, or those who served in the army at their own expense.
ASSIENTO, or ASSIENTA, in matters of Commerce, a contract or convention between the King of Spain and other powers for furnishing the Spanish dominions in America with negro slaves.

The term is originally Spanish, and signifies a bargain: accordingly the first assiento was a treaty or contract made with the French Guinea company, whereby they were put in possession of this privilege, in consideration of a certain duty which they were to pay to the king of Spain's farms, for every negro thus furnished.

The Spaniards, having almost destroyed the natural inhabitants of Spanish America, have been many years, and still are, upon the part of their Ministers, and other laborious negociations, by request, upon which they could never ever obtain the number they have wanted: and it is certain, if they were fully suppli'd, they would get yearly above twice the silver they now do; or have done for many years past. It must be confessed, they have used various means to obtain them. The Genevese undertook to supply them at a concerted price between them; for which end they formed a company called the assiento, who had their factors at Jamaica, Carabas, and Brazil; but by their ill management made nothing of this contract; nor did their successors the Portuguese. After them it fell into the hands of the French, who made so much of it, that they were enabled, by a computation made from the registres of Spain, to bring it into the French dominions, left than 194,000,000 of pieces of eight. Yet they at length glutted the market, and became sufferers towards the conclusion.

By the treaty of Utrecht, Philip V, being declared king of Spain by the allies, it was one of the articles of the peace between England and France, that the assiento contract should be transferred to the English. Accordingly a new instrument was signed in May 1715: it lasted thirty years; and the furnishing of negroes to Spanish America was committed to the South-sea Company; but then erected; though the first convention for this purpose was made in 1689.

In virtue whereof they were yearly to furnish 4,000 negroes; for which they were to pay at the same rate as the French, with this condition, that during the first twenty-five years, only half the duty shall be paid for such as they shall import beyond the stated number.

The last article gives them a farther privilege not enjoyed by the French; which is, that the English subjects shall be allowed, every year, to send to the Spanish America a ship of five hundred tons, laden with the same commodities as the Spaniards usually carry thither; with a licence to sell the same concurrently with them, at the ports of Porto Bello, Carthagena, and Vera Cruz. This additional article was looked upon as advantageous to the company, as the whole contract besides being granted contrary to the usual Spanish policy, which has ever effectually preferred the commerce of their America to themselves.

Some new articles were afterwards added to the ancient assiento; as, that the English should send their register-ship yearly, even though the Spanish flota and galleons did not go; and that, for the first ten years, the said ship might be of 550 tons.

Finally, as the South-sea company had on the whole been losers by their trade, and at the time of the treaty of Aix-la-Chapelle, in 1748, they had only four years more of their assiento term remaining (the war between Spain and England having commenced in 1739, and interrupted the continuance of it), which Spain was determined not to renew, at least not on any promising terms; for these and other reasons, it was concluded by the British court to infringe her minister at Madrid, to obtain the best equivalent that could be procured for the remaining short time of the company's assiento contract.

By the treaty of Madrid, concluded on the 5th of October 1759, it was agreed that his Britannic Majesty should yield to his Catholic Majesty his right to the enjoyment of the assiento of negroes, and of the same ship, during the years stipulated by the treaty of Aix-la-Chapelle, and in consideration of a compensation of 125,000. Being to be paid by his Catholic Majesty to the South-sea company, within three months, his Britannic Majesty agreed to surrender to him all that might be due to that company for balances of account, or in any manner arising from the former balance; thus all claims, in consequence of the contract, were finally abrogated, and a period was put to all the foreign commerce of the South-sea company.

In consequence of the assiento conveyed to Great Britain by Philip V., British factories were established at Cartagena, Panama, Vera Cruz, Enconos Ayres, and other Spanish settlements. The veil with which Spain had before this time covered the flutes and transmissions of her colonies, was removed. The agents of a rival nation, residing in the towns of most extensive trade, and of chief harbours, had the best opportunities of becoming acquainted with the interior condition of the American provinces, of observing their internal wants, and of determining what commodities might be imported into them with the greatest utility. In consequence of information from authentic and expeditions, the merchants of Jamaica, and other English colonies who traded to the Spanish main, were enabled to afford and proportion their cargoes so exactly to the demands of the merchant, that the contraband commerce was carried on with a facility, and to an extent, unknown in any former period. Besides, the agents of the British South-sea company, under cover of the stipulation which they were authorized to make by the ship annually sent to Porto Bello, gained in their commodities on the Spanish continent, without limitation or restraint. Instead of a ship of 500 tons as stipulated in the treaty, they usually employed one which exceeded 900 tons in burden. She was accompanied by two or three smaller vessels, which moving in the immediate vicinity, supplied her charitably with fresh laiks of goods, to replace such as were sold. The inspectors of the said, and officers of the revenue, gained by exorbitant pretends, concurred at the fraud. The company itself, however, furnished a considerable loss by the assiento trade; whilst many of its favours acquired immense fortunes. Thus, partly by the operations of the company, and partly by the activity of private interlopers, almost the whole trade of Spanish America was ingrafted by foreigners. The immense commerce of the galleons, formerly the pride of Spain, and the envy of other nations, sunk to nothing; and the squadron itself reduced from 15,000 to 20,000 tons inwardly hardly any more, and the year 1770, as far as the royal revenue arising from the fifth, or silver. In order to preserve these improvements, Spain nationed ships of force, under the appellation of *Guarda Costas,* on the coasts of those provinces which were most frequented by interlopers. The captains of these guarda costas, by several unjustifiable acts of violence, precipitated Great Britain into a war with Spain; in consequence of which the latter obtained a final restate from the assiento, as we have above related, and was left at liberty to regulate the commerce of her colonies, without being restrained by any engagement with a foreign power. Anderson's Commerce, vol. iii. p. 378. Robertson's Hill. Amer. vol. iii. p. 378, &c.

ASSIENTO.
ASS

ASSIGNMENT, the act of assigning or transferring the interest or property a man has in any thing; or of appointing or setting over a right to another. Assignments may be made of lands in fee, for life or years; of an annuity, rent-charge, judgment, estate, &c.: as to lands, they are usually of leases and estates for years; and an assignment differs from a lease only in this; that by a lease one grants his interest less than his own, referring to himself a reversion; whereas in assignments he parts with the whole property, and the assignee stands to all intents and purposes in the place of the assignor.

No estate of freehold or term of years shall be assigned, but by deed in writing signed by the parties, except by operation of law. Stat. 29 Car. II. cap. 3. If lease for years assign all his term in his lease to another, he cannot reserve the rent in the assignment; for he hath no interest in the thing by reason of which the rent referred should be paid; and where there is no reversion, there can be no dilsolution; but debt may be in it as on a contract. 1 Litt. Abr. 99. If the executor of a lease assigns the term, debt will not lie against him for rent incurred after the assignment; because there is neither privity of contract nor estate between the lessor and executor; but if the lease be assigned, he shall be chargeable during his life; but after his death, the privity of contract is likewise determined. 3 Rep. 14. 24. Although a lease may make an assignment even of his term, yet debt is against him by the lessor or his heir (not having accepted rent from the assignee); but where a lease assigns his term, and the lessor or his heir, the privity is determined, and debt doth not lie for the reverffion against the first lessee. Moor 472. If an assignment is made by an assignee, the first assignee is not liable for the rent; for if he be accepted by the lessor, the admission of one assignee is the admission of twenty. Comp. Attorn. 491. Where a tenant for years assigns his estate, no consideration is necessary; for the tenant being subject to payment of rent, &c. is sufficient to vest an estate in the assignees; in other cases, some consideration must be paid. 1 Mod. 263. The words required in assignments are, grant, assign, and set over, which may be expressed by several covenants, &c. 1 Johnson 321. In these deeds the assignee is to covenant to make no assignments in the future; and the assignee is to covenant to perform the covenants, &c.

The stat. 32 Hen. VIII. c. 24. gives the assignee of a reverfion (after notice of such assignment), the same remedies against the particular tenant, by entry or action, for waif or other forfeitures, non-payment of rent, and non-performance of conditions, covenants, and agreements, as the assignee himself might have had; and makes him equally liable on the other hand, for acts agreed to be performed by the assignee, except in cases of warranty. A bond, being a coven in action, cannot be assigned over to as to enable the assignee to sue in his own name; and therefore, the form of assigning a coven in action is in the nature of a declaration of trust, and an agreement to permit the assignee to make use of the name of the assignee, in order to recover the poallusion. Accordingly, when in common acceptance a debt or bond is laid to be assigned over, it must still be in the name of the original creditor, the person to whom it is transferred, being rather an attorney than an assignee. But the king is an exception to this general rule;
for he might always either grant or receive a \textit{chofe} in action by agreement; and our courts of equity, considering that in a commercial country almost all personal property must necessarily lie in contract, will protect the assignment of a \textit{chofe} in action, as much as the law will that of a \textit{chofe} in possession. 3 P. Wms. 199. In equity, therefore, a bond is assignable for a valuable consideration paid, and the assignee alone becomes entitled to the money, so that if the obligor, after notice of the assignment, pays the money to the obligee, he will be compelled to pay it over again. 2 Vern. 293.

Several things are assignable by acts of parliament, which seem not to be assignable in their own nature; as promissory notes and bills of exchange, by Stat. 3 & 4 Ann. c. 9.; bills of lading by the sheriff, by 4 & 5 Ann. c. 16.; a judge's certificate for taking and professing a false coin to conviction, by 10 & 11 W. 3. c. 23.; and a bankrupt's effects, by the several statutes of bankruptcy.

The \textit{assignment of dower} is the setting out of a woman's marriage-portion by the king. By the old law, grounded on the feudal exactions, a woman could not be endowed without a fine paid to the lord; neither could she marry again without his license; but the court could contract herself, and so convey part of the land to the lord's enemy. 2 Vern. c. 1. § 3. This became the lords' tool, to be well paid for; and as it seems, would sometimes force the dowerer to a second marriage, in order to gain the fine. But, to remedy these oppressions, it was provided, first by the charter of Henry I. and afterwards by Magna Charta (cap. 7.), that the widow should pay nothing for her marriage, nor be disinherited to marry again, if the \\textit{chofe} to live without a husband, but should not, however, marry against the consent of the lord: and farther, that nothing should be taken for assignment of the widow's dower, but that she should remain in her husband's capital mansion-house for forty days after his death, during which time, called the widow's "\textit{guarantine}," her dower should be assigned. The particular lands to be held in dower, must be assigned by the heir of the husband, or his guardian; Co. Litt. 34, 35, not only for the sake of notoriety, but also to entitle the lord of the fee to demand his services of the heir, in respect of the lands so held. But the heir by this entry becomes tenant thereof to the lord, and the widow is immediate tenant to the heir, by a lease of farinfeudation or under-tenancy, completed by this infeuditure or assignment; which tenure may still be created, notwithstanding the statute of \textit{qua in capere}, because the heir parts not with the fee simple, but only with an estate for life. If the heir or his guardian do not assign her dower within the time of quarantine, or do assign it unfairly, she has her remedy at law, and the sheriff is appointed to assign it. Co. Litt. 34, 35. Or, if the heir, being under age, or his guardian assign more than he ought to have, it may be afterwards remedied by writ of \textit{admeasurement of dower}. Bl. Com. vol. ii. 135. &c. The assignment of the lands is for the life of the woman; and if lands are assigned to a woman for years, in reversion of dower, this is no bar of dower. 2 Dom. Abr. 168. When other land is assigned, that is no part of the lands in which the woman claims dower, that assignment will not be good or binding; and there must be certainty in that which is assigned; otherwise, though it be by agreement, it may be void. 4 Rep. 2. 1 Inst. 23. If a wife accept and enter upon less land than the third of the whole, on the sheriff's assignment, she is barred to demand more. Moors. 679. But if a wife is entitled to dower of the lands of her first husband, and her second husband accepts of this dower less than her third part, she may, after his death, refuse the same, and have her full third part. Fitz. Dower. 121. By provision of law, the wife may take a third part of the husband's lands, and hold them discharged. 2 Danw. 672. The sheriff may also assign a rent out of the land in lieu of dower; and her acceptance of it will bar dower out of the same land, but not of other lands. 2 And. 31. Dyer, 1. Nelson Abr. 680. None can assign dower but those who have a freehold, or against whom a writ of dower lies; and these alone may be suitors, at tenant-merchant, at tenant-in-chief, or else, for years, cannot assign dower; for none of these have an estate large enough to answer the plaintiff's demand. Park. 403, 464. Co. Litt. 35. Bro. 63, 94. 1 Rol. Abr. 681. 6 Co. 57. If the heir within age assign to the wife more land in dower than she ought to have, he himself shall have a writ of admeasurement of dower at full age by the common law. F. N. B. 148, 332. Co. Litt. 39 a. 2 Inst. 357. 7 H. 11. c. 4. 13 Edw. 1. c. 7 & 8. If the heir within age, before the guardian enters, assigns too much in dower, the guardian shall have a writ of admeasurement, by writ. W. 11. c. 7. 2 Inst. 317. If a wife after assignment of dower improves the lands, so that they then become of greater value than the other two parts, no writ of admeasurement lies, &c. F. N. B. 149. 2 Inst. 368. 4 W. 12.

\textbf{ASSIGNMENT, Novel. See NOVEL.}

\textbf{ASSIMILATION, Compounded of ad, in, and similis, like, the act of affimilation; an act whereby a thing is rendered similar, and like to another.}

\textbf{ASSIMILATION, ASSIMILATION, in \textit{Physic}, is properly a motion whereby bodies convert other duly digested bodies into a nature like, or homogeneous to their own. Influences of this assimilation we fee in flame, which converts the oily or other particles of fuel into its own fiery and luminous nature. The like also appears in air, smoke, and spirits of all kinds.}

The like we fee in vegetables, where the watery juices imbibe from the earth, being farther prepared and digested in the veins of the plant, become of a vegetable nature, and augment the wood, leaves, fruit, &c.

So also, in animal bodies, we see the food assimilated or changed into animal substanby, by digestion, chylification, and the other operations necessary to nutrition.

\textbf{ASSIMILATION, in \textit{Rheto ric. See SIMILE.}

\textbf{ASSIMILATOR, in \textit{Entomology,} a species of \textit{Ichneumon,} found in North America. The general colour is scarlet; anterior part of the thorax black; wings brown; base and band yellowish, with a fanginous dot. Swederus Nov. Ad. Stockh. &c.}

\textbf{ASSIMILIS, a species of \textit{Brentus,} a native of New Zealand, and first described by Fabricius in his \textit{Species Insectorum,} under the name of \textit{Ceruloco assimilis.} It is of a cylindrical form, with the apex of the beak gibbous and black; and the wing-cases somewhat faciated with ferruginous. Fabr. Genel. &c.—\textit{Ofi.} The front is shorter than the body; antennae black, brown at the tip; thorax black, and camellate; wing-cases pointed, and marked with four or five dots.}

\textbf{ASSIMILIS, a species of \textit{Geiylus} (\textit{Acbta section).} The wings are tinted, and longer than the wing-cases; abdomen with two styles, which are cleft at the end.}

\textbf{ASSIMILIS, a species of \textit{Sphinx,} that inhabits Tranquebar. It is black; antennae tall, and legs rufous; wings blue, white at the base and tip. Fabr. Mant. Inf.}

\textbf{ASSIMILIS, a species of \textit{Oniscus,} found in the European fens. It is oval; the tail obtuse and unarmed; body chitinous. Fabricius. This is \textit{stelius marinus vulgeri brev.
ASS

ASSINOIS, a nation of Indians, inhabiting the forests of Canada.

ASSINIBOIN, or Red River, sometimes called Assinibois, and Assinipait, a river in the north-west part of North America, which discharges on the south-west side of the lake Winnipeg, in N. lat. 53° 20', W. long. 96° 30'. It alternately receives the two denominations of Assiniboin and Red river, from its dividing at the distance of about thirty miles from the lake into two large branches. The eastern branch, called the Red river, runs in a southern direction to near the head waters of the Missouri. On this river are two trading establishments. The country, on either side, is but partially supplied with wood, and consists of plains covered with herds of the buffalo and elk, especially on the western side. On the eastern side are lakes and rivers, and the whole country is well wooded, level, and abounding with beavers, bears, moose-deer,allow-deer, &c. &c. The inhabitants, who are of the Algonquin tribe, are not very numerous, and are considered as the natives of lake Superior. This country is also inhabited by the Nadowatis, who are the natural enemies of the former; and the head of the water being in the war-line, they are in a state of continual hostility. Although the Algonquins are equally brave, they are generally outnumbered by the others; and, therefore, if they venture out of the woods, which form their only protection, they will probably be soon extirpated. There is not, it is said, a finer country in the world, for the residence of uncivilized man, than that which occupies the space between this river and lake Superior. It abounds in every thing necessary to the wants and comfort of such people. Fish, venison, fowl, and wild rice, are very plentiful; and their subsistence demands that exercise which is essential to health and vigour. This country was formerly very populous; but the aggregate of its inhabitants does not now exceed 500 warriors; and the widows appear to be more numerous than the men. The racoon is a native of this country, but is seldom found to the northward of it.

The other branch of the river is called after the tribe of the Nadowatis, who are denominated Assiniboins, and who are the principal inhabitants of its environs. It runs off from the N.N.W., and in N. lat. 51° 25', and W. long. 103° 26', rises in the fame mountains with the river Dauphin. The country between this and the Red river is about a continual plain to the Missouri. The soil is sand and gravel, with a slight mixture of earth, and produces a short grafs. Trees are very rare, and insufficient, except in particular spots, for building houses, and supplying fire-wood for the trading establishments, of which there are four principal ones. Both these rivers are navigable for canoes to their sources, without a fall; though in some parts there are rapids, caused by occasional beds of limestone and gravel; but the bottom in general is sandy.

The Assiniboins, and some of the Full, or big-bellied Indians, are the principal inhabitants of this country, and border on the river, occupying the central part of it; that next lake Winnipeg, and about its sources, being the station of the Algonquins and Kniffeneans, who have made choice of it in preference to their own country. They do not exceed 500 families. They are not beaver-hunters, which accounts for their allowing the division full mentioned, as the lower and upper parts of this river have those animals, which are not found in the intermediate district. They confine themselves to hunting the buffalo, and trapping wolves, which cover the country. What they do not want of the former, for raiment or food, they sometimes make into pemmican, or pounded meat, while they melt the fat, and prepare the skin on their hair, for winter use. The wolves they never eat; but produce a tallow from their fat, and prepare their skins; all which they exchange for arms or ammunition, gun, tobacco, knives, and various bawbles, with those who go to traffic in their country. Those Nadowats, or Assiniboins, called also Stone Indians, who inhabit the plains on and about the source and banks of the Saskatchewan and Assiniboine rivers, are supposed to have migrated from the southward, being detached tribes from the Nadowats, who inhabit the western side of the Missouri, and lower part of the Missouri, and their progress is north-west. Mackenzie's Voyages from Montreal, &c. Introd. p. 62, &c. p. 407.

ASSIRATUM, in Antiquity, a bloody draught, where-with treaties were ratified. It was made of wine and blood, called by the ancient Romans, affir.

ASSIS, in Physiognomy, either denotes opium, or a powder made of hemp-feed, which being formed into bags about the bigheads of chepnuts, is swallowed by the Egyptians, who are hereby intoxicated, and become ecclatique, and full of the most agreeable visions.

This is also called by the Turks officer.

ASSISA, or ASSISIA. See the articles ASSISE, and TALLIAGE.

Assise, cadere, to fall from the affisse, in Law, is to be non-suited. Fleta, l. iv. c. 15. Bracton, l. ii. c. 7.

Assise cadit in juramento, is where the thing in controversy is so doubtful, that it must necessarily be tried by a jury. Fleta, l. iv. c. 15.

Assise capit in medium affisse, is when the defendant pleads directly to the affise, without taking any exception to the count, declaration, or Writ.

Assisa continuanda, is a Writ directed to the justice, to take an affise for the continuance of the cause, where certain records alleged cannot in time be procured by the party. Reg. Orig. 217.

Assisa nominati, is an affise of NUSEANCE. See the article.

Assisa pars & cerevisia, denotes the power or privilege of afening and adjusting the weight and measure of bread and beer.

Assisa judicium, in Law, signifies a judgment of the court, given either against the plaintiff or defendant, for default.

Assisa propaganda, is a Writ directed to the judges of affise, for the day of proceedings, on account of the king's business wherein the party is employed. Reg. Orig. 208.

ASSISE, or ASSIS, affisse, in Law, a sitting of judges or justices, for the hearing or determining of causes. The word is French, affise or affis, stated; formed of the Latin affisitio, to fit together, which is compounded of ad, to, and sedo, I sit.

Thus is the etymology of the word affise, given by Sir Edward Coke; so that it signifies, originally, the jury who try the cause, and fit together for that purpose. By a figure, it is now made to signify the court or jurisdiction, which fummons this jury together by a commision of affise, or una affisa capienda, whence the judicial assemblies held by the king's commision in every county, as well as to take these writs of affise, as to try causes at "Nisi Prius," are termed in common speech, the affise.

ASSIS,
ASSISE, Clerk of. See Clerk.

Assise, or Assizes, was, at first, used for certain extraordinary fittings of inferior judges, in the inferior courts depending on their jurisdiction, to inquire whether the fabular judges and officers did their duty; to receive the complaints preferred against them; and take cognizance of appeals from them. These are also called mercurial officers.

Assise was also a court or assembly, composed of several great persons of the realm; held occasionally in the king's palace, for the final decision of all affairs of importance.

This is still used, among our writers, placita publica, or curia generis. Yet there is some difference between assises and placent. — The vicounts or sheriffs, who originally were only lieutenants of the comites, or counts, and rendered justice in their place, held two kinds of courts: the one ordinary, held every day, and called placentum; the other extraordinary, called affise, or placita generis; at which the court itself ascribed, for the dispatch of the more weighty affairs. Hence the term assise came to be extended to all grand days of judgment, at which the trials and pleadings were to be solemn and extraordinary.

The modern constitution of assises is different from that above-mentioned. — Our assise may be defined a court, place, or time, where and when writs and proceedings, either civil or criminal, or both, are considered, dispatched, decided, &c. by judges and jury.

In this sense, we have two kinds of assises: general and special.

Assise, or Assizes, generally, are those held by the judges twice a year, in their several circuits.

The nature of the assises is explained by lord Bacon, who observes that all the counties of the kingdom are divided into circuits; to each of which two learned men, assigned by the king's commission, are sent twice a year, except London and Middlesex, where courts of nisi prius are holden in and after every term, before the chief or other judge of the several superior courts; and except the four northern counties, where the assises are holden only once a year. There are called justices, or judges of assises, and have several commissions by which they sit; viz.

1. A commission of oyer and terminer, directed to them, and many others of the best account in their respective circuits. In this commission, the judges of assise, or serjeants at law, are only of the quorum; so that without them there can be no proceeding. This commission which is the largest they have, gives them power to try fact matters relating to treasons, murders, felonies, and other misdemeanors. See Oyer and Terminer.

2. The second is of gaol-delivery, which is only to the judges themselves, and the clerk of the assise五官。—By this commission, they have concern with every prisoner in gaol, for every offense whatsoever. See Gaol-Delivery.

3. The third is of affise, directed to themselves and the clerk of the assise, to take writs of poification, called also affises, in the several counties; that is, to take the verdict of a peculiar fact, or of a jury, called an affise, and summoned for the trial of landed disputes. These writs were formerly frequent; but now men's possessions are sooner recovered by ejectments, &c.

4. The fourth is to take the nisi prius, directed to the justices, and the clerks of assises; whence they are also called justices of nisi prius. See Nisi Prius.

5. The fifth is a commission of peace, in every county of their circuit; and all the justices of the peace, having no lawful impediment, are bound to be present at the assises, to attend the judges.

The sheriff of every shire is also to attend in person, or by a sufficient deputy allowed by the judges, who may fine him if he fail.

These commissions are constantly accompanied by writs of affirmation, in pursuance of the statutes 27 Edw. I. c. 2; 12 Edw. II. c. 5; by which certain persons (usually the clerk of the assise and his subordinates officers) are directed to associate themselves with the justices and serjeants, and they are required to admit the said persons into their society, in order to take the affises, &c. that a sufficient supply of commissioners may never be wanting. But to prevent the delay of justice by the absence of any of them, there is also issued of course a writ of if non omnis, directing, that if all cannot be present, any two of them (a justice or serjeant being one) may proceed to execute the commission.

There is a commission of the peace, oyer and terminer, and gaol-delivery of Newgate, held eight times in every year, for the city of London and county of Middlesex, at justice-lay in the Old Bailey, where the lord-mayor is chief judge. In Wales there are but two circuits, North and South Wales; for each of which the king appoints two persons learned in the law to be judges. Stat. 15 Eliz. c. 8.

This excellent constitution of judges, circuits, and assises, was begun in the time of Henry II. though somewhat different from what it is now.

The grand assise, or trial by jury, instituted by Henry II., as an alternative instead of judicial combats, is particularly described by Glanvil, who was probably the advisor of the measure.

For this purpose a writ, De magna assisa eligendo, was directed to the sheriff, to return four knights, who were to elect twelve others to be joined with them; all these together formed the grand assise, ordained to try the matter of right.

The judges of assise came into use in the room of the ancient justices in eyre, juxtitarii in iterine; who were formerly established, if not first appointed, by the parliament of Northampton, A.D. 1176, 22 Hen. II. with a delegated power from the king's great court; and they afterwards made their circuit round the kingdom once in seven years, for the purpose of trying causes. They were afterwards directed by Magna Charta, c. 12, to be sent into every county once a year. Blackstone's Com. vol. iii. See Justices of Assises.

Assise Special, is a particular commission granted to certain persons, to take cognizance of some one or two causes, as a difficult, or the like. This was very frequently practised among our ancestors. Bracton, lib. iii. c. 12.

Assise is also used for a writ directed to the sheriff, for the recovery of poifications of things immovable, whereof a man's self, or ancestors have been dispossessed.

Lytton, and others, suppose these writs of assise, in which the sheriff is ordered to summon a jury of assise, to have given the denomination to the affises, or courts called; and they assign several reasons of the name of the writ: as

1. Because such writs settle the possession and right, in him that obtains by them. 2. Because originally they were executed at a certain time and place appointed; for by the Norman law, the time and place must be known forty days before the judges sit; and by our law there must be fifteen days preparation, except they be tried in the standing courts at Westminster. But it is more natural to suppose the writs denominated from the courts: and that they were called assises, because anciently tried at special courts of assises, and for and appointed for that purpose. Though of latter days, the
ASSISE.

There are disputation at the general assises, along with the committeed over and terminer, &c.

This writ of assize is said to have been invented by Glanvil, chief justice to Henry II. and if so, it seems to owe its introduction to the Parliament held at Northampton in the twenty-second year of that prince's reign; when judges in oyer were appointed to go round the kingdom, in order to take these offices; and the claims themselves (particularly those of mort d'ancello and novel diffeisin) were clearly pointed out and described. As a writ of entry is a real action. This follows the title of the tenant, by showing the unlawful commencement of his possession, so an assize is a real action, which proves the title of the demandant merely by showing his or his ancestor's possession; and these two remedies are in all other respects so totally like, that a judgment or recovery in one is a bar against the other; so when a man's possession is once established by either of these postponement actions, it cannot be disturbed by the same agoneal, in any other of them.

This remedy by writ of assise was called by flat, Wilm. 2. 1 Edw. I. c. 24. lefsum remedium, in comparison with that by a writ of entry; as it did not admit of many dilatory pleas and proceedings, to which other real actions are subject, and it is only applicable to two species of injury by ouer, viz. abatement and a recant or novel diffeisin.

Assize of Mort d'Ancefor, or death of one's ancestor, is a writ that lies when father or mother, brother or sister, uncle or aunt, nephew or niece, died seized of lands, tenements, rents, &c. held in fee simple; and after their death, a stranger abates. It is good as well against the abateor, as against any other in possession; but it lies not against brothers or sisters, &c. where there is privity of blood between the person professing and them. Co. Litt. 242. It must also be brought within the time limited by the statute of limitations, in fifty years; or the right may be lost by negligence.

This writ directs the sheriff to summon a jury or assise, who shall view the land in question, and recognize whether such ancestor was seized thereof on the day of his death, and whether the demandant be the next heir; soon after which, the judges come down by the king's commission to take the recognition of assise; when, if these points are found in the affirmative, the law immediately transfers the possession from the tenant to the demandant. F. N. B. 195. Finch. L. 292. If the abatement happened on the death of one's grandfather or great-grandfather, then an assize of mort d'ancefor no longer lies, but a writ of "aid," or "de acest," if on the death of the great grandfather or great grandmothe, then a writ of "de fejude," or "de preme," but if it mants one degree higher, to the "trifiple" or grandfathers, if or if the abatement happen upon the death of any collateral relation, other than those before mentioned, the writ is called a writ of "esionage," or "de confamaginæ." Finch. L. 266, 267. And the same points shall be inquired of in all these actions "ancefor," as in an assize of mort d'ancefor, as they are of the same nature (flat, Wilm. 2. 13 Edw. I. c. 20.; though they differ at this point of form, that these assize writs (like all other writs of "præcept") expressly assert a title in the demandant (viz. the feinor of the ancestor at his death, and his own right of inheritance); the assize asserts nothing directly, but only prays an inquiry whether these points be so. 2 Lind. 399. There is also another ancestor writ, denominated a "super obitii," to establish an ownership of the land in question; where, on the death of an ancestor, who has several heirs, one eminently holds the others out of possession. F. N. B. 195. Finch. L. 293. But a man is not allowed to have of any these actions nor filed for an abatement consequent on the death of any collateral relation, beyond the fourth degree (flat. on P. N. L. 221.), though in the lineal ascents he may proceed in "impignora." It was always held to be law (Bracton, lib. 4. c. 13. s. 3. P. N. B. 223.), that where lands were destrivable in a man's will by the custom of the place, there an assise of mort d'ancello did not lie. For where lands were to devolve by the right of possession could never be determined by a process, which merely inquired concerning the feinor of the ancestor, and the heriour of the demandant. Hence it may be reasonable to conclude, that when the statute of wills, 32 Hen. VIII. c. 1. made all leases transitory, the fee of mort d'ancello no longer be brought of lands held in fee simple, and that now, since the statute 12 Car. II. c. 24. which converts all tenures, a few only excepted, into free and common fee simple, no assise of mort d'ancello can be brought of any lands in the kingdom; but that, in case of abatements, recourse must be properly had to the writs of entry. Bl. Com. vol. iii. p. 187.

These writs, however, are now almost obsolete, being in a great measure superseded by the action of ejectment, which answers almost all the purposes of real actions, some very peculiar cases excepted.

Assise of Novel Diffeisin is an action of the same nature with the "assise of mort d'ancello," as this in the demandant's possession must be shown. But in other points it is different, particularly as it recites a complaint by the demandant of the diffeisin committed in terms of direct averment; whereupon the sheriff is commanded to recite the land, and all the chattels thereon, and keep the same in his custodiy till the arrival of the Justices of assise (which, in fact, hath been usually omitted) and in the mean time to summon a jury to view the premises, and make recognition of the assise before the Justices. F. N. B. 175. At which time the tenant may plead either the general issues, "nulli tort," "nulli dificeisin," or any special plea. And if, upon the general issue, the recognizors find an actual feinor in the demandant, and his infrubeste dificeisin by the present tenant, he shall have judgment to recover his seisin, and damages for the injury sustained.

This is called "novel dificeisin," because the Justices in eyre went their circuits from seven years to seven years; and no assise was allowed before them, which commenced before the land circuit, called an "ancient assise;" and that which was upon a dificeisin since the last circuit, an assise of novel or recent dificeisin. Co. Litt. 242. 2. This remedy lies where the tenant in fee simple, fea tail, or for term of life, is put out and duceffor of his lands or tenements, rents, common of pasture, common way, or of an office of profit, toll, &c. Glasov. l. i. Reg. Orig. 195. Avice lies for tithes, by flat. 32 Hen. VIII. c. 7. Cro. Eliz. 559.; but not for an annuity, pension, &c.

For preventing frequent and vexatious dificeisin, it is enacted by the statute of Merton, 20 Hen. III. c. 3. that if a person dificeisin recover seisin of the land again by assise of novel dificeisin, and be again dificeisin of the same tenants by the same dificeisin, he shall have a writ of "re-dificeisin;" and if he recover therein, the re-dificeisin shall be imprisoned. And by the statute of Marberge, 52 Hen. VIII. c. 8. shall also pay a fine to the king; to which the statute Wilm. 2. 13 Edw. I. c. 26. hath superadded double damages to the party aggrieved. In like manner, by the same statute of the statute of Merton, when any lands or tenements are recovered by assise of mort d'ancello, or other writ, or any judgment of the court, if the party be afterwards dificeisin by the same person against whom judgment was obtained, he shall have a writ
A S S I S E.

A writ of "paiz-diffin" against him; which subjects the paiz-diffin to the same penalties as a re-diffin. The reason of which, given by Sir Edward Coke, 2 Inst. 83; 84, is, because such proceeding is a contempt of the king's Court, and is against the law. Bracton, l. 4. c. 49.

The court of Common Pleas, or King's Bench, may hold ple of affiles of land in the county of Northen, by writ out of Chancery 1 Litt. Abr. 195. And in cities and corporations an "affile of frefh force" lies for recovery of possession of lands, within forty days after the affile, as the ordinary affile is in the county. F. N. B. 7.

Assise of Derrein Prefentment, or latl prezentation, lies when a man, or his ancestors, under whom he claims, have presented a clerk to a benefice, who is intituted, and afterwards upon the next avoidance, a stranger presents a clerk, and thereby disturbs him that is the real patron. In this case the patron shall have this writ directed to the sheriff to summon an affile or jury, to inquire who was the last patron that presented to the church now vacant, of which the plaintiff complains that he is deforced by the defendant; and, according as the affile determines that question, a writ shall issue to the bishop, to intitute the clerk of that patron in whose favour the determination is made, and also to give damages, in pursuance of statute Westm. 2. 13 Edw. 1. c. 5. The statute of 7 Ann. c. 14, having given a right to any perfon to bring a writ of "quare impedit," and to recover (if his title be good, notwithstanding the last presentation, by whomsoever made; affiles of derrein prezentment now not being in my wife, have been totally diffued, as indeed they began to be before; a "quare impedit." being a more general, and therefore a more usual action. For the affile of derrein prezentment lies only where a man has an advowson by deferent from his ancestors; but the writ of "quare impedit" is equally remedial, whether a man claims title by deferent or purchase. 2 Inst. 353. Bl. Com. vol. iii. p. 246.

Assise of Juris vivrum, sometimes filled the parson's writ of right, being the highest writ which he can have, lies for a pardon or prebendary at common law, and for a vicar by lat. 14 Edw. III c. 17 and is in the nature of an affile, to inquire whether the tenements in question are frankalmoign belonging to the church of the demandant, or else the lay-fie of the tenant. By this the demandant may recover lands and tenements, belonging to the church, which were aliened by the predecefer; or of which he was deforced; or which were recovered against him by verdict, confession, or default, without praying in aid of the patron and ordinary; or on which any person has intruded since the predecefer's death. F. N. B. 48, 49. But since the reaining statute of 13 Eliz. c. 12, whereby the alienation of the predecefer, or a recovery suffered by him of the lands of the church, is declared to be absolutely void, this remedy is of very little use, unless where the parson himself has been deforced for more than twenty years; for the successor, at any competent time after his accession to the benefice, may enter, or bring an ejectment. Bl. Com. vol. iii. p. 253.

Assise is also used, according to Lyttleton, for a jury. This that author supposes to be by a statioinia effi, the jury being so called, because summoned by virtue of the writ of affile.

Yet it must be observed that the Jury summoned upon a writ of right is likewise called the affile; but this may be said to be statioinia effi, or abusively so termed. Assise, in this signification, is divided into magna & parva.

Assise is farther used, according to Lyttleton, for an ordinance or statute, regulating the weight, size, or di-

Assise is farther used for the sounding or quantity itself prescribed by the statute. When wheat is of such or such price, bread shall be of such affile. See Bread

Assise is farther used for the sounding or quantity itself prescribed by the statute. When wheat is of such or such price, bread shall be of such affile. See Bread

We have divers statutes for fixing the affile of fish, clothes, wood, billets, faggots, and the like. Vide 34 & 35 Hen. VIII. c. 2. Ann. c. 15. 10 Ann. c. 6. 19 Car. II. c. 3. 4 Jac. I. c. 9. 1 Geo. I. rat. 2. c. 18.

Fixing any affile of cloth, or preferring what length, breadth, weight, &c. it hall have, for Julian Child thinks, does more hurt than good. As the fashions and humours of mankind are variable, to supply all markets at all times, we must have all sorts, cheap and light, as well as heavier and better. Stretching with tenders is essential to our drapery, and the precise degree or quantity of it cannot without injury be prescribed by any law; but must be left to the winder's or exporter's discretion.

Assise of the Forest, is a statute or condition containing orders to be observed in the king's forest. It is called an affile, because it sets down and appoints a certain measure, rate, or order, in the things it concerns.

Assise, again, is used for the whole process in court, founded on a writ of affile; and sometimes for a part of it, viz. the issue, or verdict of the jury.

Thus we read, that "affiles of novell difiefin shall not be taken but in their thires; and after this manner," &c. Mag. Chart. cap. 12. So in Merton, cap. 4. Hen III we meet with, "certified by affile, quitted by affile," &c.

Assise of the King, a name given to the statute of view of frank-pledge, 18 Edw. II.

Assise at large, is brought by an infant to inquire of a differ, and whether his ancestor were of full age, good memory, &c. when he made the deed pleaded, whereby he claims his right.

Assise in Point of Affile, affiles in modum affinis is when the tenant, as it were, setting foot to foot with the demandant, without any thing further, pleads directly the writ, no wrong, no differ.

Assise out of the Point of Affile, is when the tenant pleads something by exception, as a foreign release, or foreign matter triable in a foreign country; which must be tried by a jury, before the principal cause can proceed.

Assise of Right of Damages, is where the tenant confesseth an outlaw and referring it to a demurrer in law, whether it were rightly done or not, is adjudged to have done wrong; whereupon the demandant shall have a writ of affile to recover damages. Bracton, l. 4. F. N. B. 125.

Assise of Arms, a name given to an act of 25 Hen. II. which provided that every man's armour should defend to his heir, for defence of the realm; and which, together with the statute of Wincheller, 13 Edw. I. c. 6. obliged every man, according to his estate and degree, to provide a determinate quantity of such arms as were then in use, in order to keep the peace.

Assise, Black, in History, an affile held at Oxford, in July, A.D. 1577, so called on account of a sudden "damp" which is laid to have arisen, and, after nearly smothering the whole court and audience, occasioned the death of the judge, high sheriff, most of the jury, and above 500 of the spectators. This fatality was ascribed by the vulgar to magic; but the discernment of lord Bacon law through the mill of superstition. The symptoms of this disorder, which seems to have been the first appearance of the gael-fever in England, marked the most extreme putridity.

Assise,
Assis, Certificate of, in Law, a writ granted by the
Weeds. 2, c. 25, to a party aggrieved, by a verdict or judgment
given against him in an affile, when he had something to plead, as a record or release, which could not have been
pleaded by his bailiff, or when the affile was taken against
himself by default, to have the deed tried, and the record
brought in before the justices, and the former jury summoned
to appear before them at a certain day and place, for
a further examination and trial of the matter. This,
in reality, was neither more nor less than a second trial of
the same cause by the same jury. Bracton, l. 4. tr. 5. c. 6. § 2.
P.N. B. 181. 2 infra. 415.
Assis, Continuance of. See Continuance.
Assis, Justices of. See Justices.
Assis, Limitation of. See Limitation.
Assist, Rent of. See Rent.
Assisier, or Assizer, of wages and measures, is an
officer who has the care and oversight of those matters.
Assisi, in Geography, a town of Italy, belonging to
the fates of the church and duchy of Spoleto; it is the see
of a bishop, and famous for being the native place of St.
Francis, and for the beautiful church belonging to the order
instituted by that saint, in which Some hay he was buried; as
well as for the great number of pilgrims resorting to it. It
is fifteen miles west of Nocera.
Assisi, in Ecclesiastical Writers, denote persons benefi-
cated in a cathedral church, not in a rank below that of can-
cons. The affile perhaps answered to our minor canons.
They were thus called, either because they were allowed an
affile or pension; or from affiliaus, diligent.
Assisior, the name with affe. In Scotland, affis-
ors are the name with our jurors.
Assistance. See Aid.
Assistant is used for a person or officer appointed
to attend another principal officer, for the more easy and
regular discharge of his functions.—Such a bishop or priest had
seven or eight affilis.
Assistant, in Roman Catholic countries, is particu-
larly applied to a kind of counsellors, or comptrollers,
added to the generals or superiors of monasteries, &c. to
take care of the affairs of the community.
The general of the fafetes has five affilis, of confum-
mate experience, chosen by him out of all the provinces of
the order, and denominated from the kingdoms or countries
to which they belong, i.e. Italy, Spain, Germany, France,
and Portugal. In a like fate, most of our trading companies
have their courts of affilis.
Assisiers are also those condemned to affile in the exe-
cution of a criminal.
Assus, in Ancient Law Writers, denotes a thing de-
mised or farmed out for such an affile or certain rent, in
money or provisions. Hence terra affis was commonly op-
posed to terri dominie; this last being held in demesne, or oc-
cupied by the lord, whereas the former was let out to tenants.
Hence also rohisus affis denotes the fet or landing rent.
Assithment, or Assihment, in the Law of Scotia-
land, is a compensation for a man slain.
Affihment is the name with what, in the English Law,
is called Mansutoff.
Assisus, in Physiography. See Lapis Affus.
Assiut, in Geography. See Stout.
Asso, in Ancient Geography, a town of Hispania Tar-
racagon&, in the country of the Balitani. Ptolemey.
Associate, compounded of ad, and fecus, compa-
nion, an adjuté, partner, or member.
Association, Associatio, the act of associating,
or forming a society or company.

Affiliation is properly a contract or treaty of partner-
ship, whereby two or more persons unite together, either
for their mutual assistance, or for the joint carrying on
of an affair; or even for a more commodious manner of life.
In a military sense, it denotes any number of men embo-
ded in arms for mutual defence in their district, and for
preserving the public tranquillity against foreign and do-
mic enemies.
The clofeft of all affociations is that made by the band of
matrimony. See Society.
Association of Ideas, is where two or more Ideas con-
stantly and immediately follow or succeed one another in
the mind, so that one shall almost infallibly produce the
other; whether there be any natural relation between
them or not. Or, it is that principle or faculty by which
two or more sensations, ideas, or motions, are so united
together, that any one imprest alone shall excite all the rest.

Where there is a real affinity or connection in ideas, it is
the excellency of the mind to be able to collect, compare,
and range them in order, in its inquiries; but where there
is none, nor any cause to be assigned for their accompanying
each other, but what is owing to mere accident or habit,
this unnatural affiliation becomes a great imperfection, and
is, generally speaking, a main cause of error or wrong ded-
cutions in reasoning. Thus, the idea of goblins and frights has
really no more affinity with darkness than with light;
and yet let a foolish maid induct them ideas often on
the mind of a child, and leave them there together, it is
possible he shall never be able to separate them again so long
as he lives, but darkness shall ever bring with it those fright-
ful ideas.—Let custom, from the very childhood, have
joined the idea of figure and shape to the idea of God,
and what absurdities will that mind be liable to about the
Deity!

Such wrong combinations of ideas, Mr. Locke shows,
are a great cause of the irreconcilable opposition between
the different sects of philosophy and religion; for we can-
not imagine, that all who hold tenets different from, and
sometimes even contradictory to one another, should wil-
fully and knowingly impose upon themselves, and refuse
truth offered by plain reason; but some base and inde-
pendent ideas are by education, custom, and the constant
sin of their party, so coupled in their minds, that they always
appear there together: these they can no more separate in
their thoughts, than if they were but one idea, and they
are possessed of if they were not. This gives birth to jargon,
demonstration to absurdities, conniving to non-sense, and is
the foundation of the greatest, and almost of all, the errors
in the world.

Mr. Hume observes (Essays, vol. i. p. 51.) that this is
a principle of connection between the different thoughts
or ideas of the mind; and that, in their appearances to the
memory or imagination, they introduce each other with a
certain degree of method and regularity. Of this con-
nection he alleges evidence from our more serious thinking
or discourse, from our wildest and most wandering reveries,
and even our dreams, and from our loftest and finest con-
version. Among different languages, also, words expres-
sive of ideas the most compounded, nearly correspond to
each other; and hence it is inferred, that the simple ideas
compounded in the compound ones are bound together by
some universal principle, which has an equal influence on
all mankind. This writer ascribes the association or con-
nection of ideas to three principles; viz. "resemblance,"
"contiguity" in time or place, and "cause" or "effect."
These, he says (p. 54.), are the only leads that unite our
thoughts.
thoughts together, and beget that regular train of reflection or discourse, which, in a greater or lesser degree, takes place among all mankind. Although it should be allowed, that there are real principles of association or connection in our ideas, it may be urged that ideas succeed one another without resemblance or contiguity as to time and place, and without the mutual correspondence or relation of cause and effect; and that there are other associations besides those of ideas, which are associated with passions and emotions, and passions and emotions are associated together. A particular idea is associated together with a proper name, and often with the general name of the species; general conceptions, or mixed modes, as they are denominated by Mr. Locke, are associated with signs both audible and visible, and signs are associated with one another. Virtue, as it belongs to action and intention, does not resemble the found virtue, is not contiguous to it in time or place, and is neither its cause nor its effect; nor can it be imagined that the arbitrary signs of various objects should have any natural relation to one another. But if there were no other principles of association besides those of Mr. Hume, the author himself has not shown how they account for the phenomena.

Dr. Hartley, whatever may be thought of his general system, has attempted to form a mechanical theory of the human mind and its various operations by means of association. The principle or law of association seems to have first noticed by Mr. Locke; but he applied it to the solution of very few phenomena. Mr. Gay, in a "Dissertation upon Virtue," prefixed to "Law's Translation of King's Origin of Evil," deduces the moral feelings from association; and Dr. Hartley traces all, or at least most of the other phenomena of mind to the same cause. This law of association extends to sensations, to ideas, and to muscular motion; which see respectively.

Accordingly it distinguishes it into synchronous and successive; and defines our simple and complex ideas to the influence of this principle or habit. Particular sensations result from previous vibrations conveyed through the nerves to the medullary substance of the brain; and there are intimately associated together, that any one of them, when impressed alone, shall be able to excite in the mind the idea of all the rest. Thus we derive the ideas of natural bodies from the association of the several sensible qualities with the names that express them, and with each other. The light of part of a large building faggots the idea of the rest instantaneously, by a synchronous association of the parts; and the sound of a word, which begins a familiar sentence, brings to remembrance the remaining parts in order by successive association. Dr. Hartley maintains that simple ideas run into complex ideas by association; and apprehends that by pursuing and perfecting this doctrine, we may come sometimes or other be enabled to analyze those complex ideas that are commonly called the ideas of reflection, or intellectual ideas, into their several component parts, i.e. into the simple ideas of sensation of which they consist; and that this doctrine may be of considerable use in the art of logic, and in explaining the various phenomena of the human mind. For a further explication of Dr. Hartley's doctrine of association, the philosophical principles upon which it depends, and the mode of its application, the reader must be referred to his "Observations on Man," vol. 1, or part 1, p. 124, and also to Priestley's "Abridgment of Hartley," 8vo.; Stewart's "Elements of the Philosophy of the Human Mind," 4to. 1792, ch. vi.; Darwin's "Zoonomia," vol. 1, § 5—16.

A late writer observes, that the doctrine of association is to be very carefully distinguished from the theory of vibrations, being established upon independent evidence and unimpeachable facts. This therefore, he adds, must stand, though the other should be regarded only as a plausible hypothesis, insufficient of satisfactory proof. It was to prevent the confusion of the nature and evidence of association and vibration, says this writer, that Dr. Priestley published his edition of Hartley's work, from which the theory of vibrations is entirely excluded. Bellamy's Elements of the Philosophy of the Mind, and of Mind and Philosophy, 8vo. 1801. p. 53. See also Ewer, Idea, Memory, Sensation, Vibrations, and Vibratization.

Association, the Law, is a writ or patent fount by the king, either of his own motion, or at the suit of a party plaintiff, to the justices of the assize, to have other persons associated to them, in order to take the assize.

Upon this patent of association, the king lends his writ to the justices of the assize, thereby commanding them to admit such as are so fount.

The clerk of the assize is usually associate of course; in other cases some learned scrivener at law are appointed. See Assize.

Association of Parliament. In the reign of king William III. the parliament entered into a solemn association to defend his majesty's person and government against all plots and conspiracies; and all persons bearing offices civil or military were enjoined to subscribe the association to stand by king William, on pain of forfeitures and penalties, &c. by stat. 7 and 8 W. III. c. 27.

Association, Feathers Tavern, consisted of a number of clergymen, and of gentlemen in the professions of civil law and physick, who, willing to be exempted from the obligation of subscribing the thirty-nine articles of religion, applied in the year 1772, by petition to parliament for this purpose. Their society was so called from the place where they met. The object at which they aimed was to be permitted to hold their preferments, upon condition of merely subscribing to the holy scriptures, agreeably to the grand Protestant principle: which is, that every thing necessary to salvation is fully contained in these scriptures, and that they are the sole rule of faith and manners. The request, however, was not thought to comport with the nature of a civil establishment in religion; and principally on this ground, it was strenuously opposed by many distinguished members of parliament, and as strenuously defended by some of the first persons in the house of commons. After a long and interesting debate, the abolition of the petition was negatived by a large majority. It was the general opinion, that these attempts to reap the benefits of the Established Church, ought to comply with the terms on which they are offered.

Association, Protestant, took its rise from an act passed in 1738, for relieving the majesty's subjects, professing the Romish religion, from certain penalties and disabilities imposed upon them in the eleventh and twelfth years of the reign of king William III. The act was passed unanimously; nor did it at first appear to excite any great alarm among persons of any class. The papists, as they now thought the government inclined to be more indulgent to them than it had formerly been, began to take somewhat greater liberties in the exercise of their religion than they to which they had been accustomed. By degrees, a number of persons in London, and in other parts of the kingdom, began to express great apprehensions of the increase of popery, and to exclaim against the late act, by which they thought it was sanctioned and supported. Meetings of these zealous persons were held from time to time in London; and they formed themselves into a body under the
ASS

the title of the “Protestant Association,” and at length Lord George Gordon became their president. The object of their association was to procure a repeal of the last act in favour of the papists. The persons who attended these meetings were, many of them, honest and well-intentioned people, who had a just aversion to popery, but who did not duly consider, that an intolerant spirit was at least as dangerous to a protestant as in a papist. In a little while, however, their number, consisting of persons in the lower ranks of life, became very considerable. A petition to parliament was framed, for a repeal of the late act, and the utmost pains were employed to procure subcriptions to it. The number of subscribers is said to have amounted to 120,000 persons. In order to give weight to their petition, it was determined that it should be attended by great numbers of the petitioners in person; and a public advertisement was issued for that purpose, signed by Lord George Gordon. Accordingly it is supposed that at least 50,000 persons assembled on the second of June at St. George’s Fields, and proceeded in great order to the house of commons, where their petition was presented by their president. Several members of both houses of parliament were greatly inflamed and ill-treated by the populace, and in the evening a mob assembled which demolished two Roman chapels. The metropolis, for several subsequent days, became an unexampled scene of alarm, terror, and devastation; and for some time the magistrate was in general manœuvred little activity. At length, when the rioters were making a formidable attack upon all property, and every man’s personal security was endangered, the military interposed, and, after considerable exertions, restored the capital of the kingdom to order and tranquillity, after a debâllement that had continued for six days, and without the loss of many lives. The number of persons killed and wounded by the military in the supplication of these riots, is said to have amounted to 458. It would be unjust, however, to impute to the protestant association, as the first agents in this business thought proper to fly themselves, the whole of the mischief that ensued, or to suppose that they foresaw the calamities to which they gave occasion. Yet it must be allowed, that those unhappy scenes owed their origin to their bigotry and delusion; and that the members of that association matured a spirit the very reverse of that which distinguishes real and enlightened protestants, and very disgraceful to the national character. It has been said, that no member of the protestant association was executed or tried for any share in the riots; and it is most probable, that those who engaged in this disorderly business from religious bigotry, would have the decision to retire before the late exactions, and before the intervention of the military. Several of the rioters were afterwards apprehended, tried, and executed. Lord George Gordon was committed to the Tower on the tenth of June, arraigned on the twenty-fifth of January, 1781; and on the fifth of February, tried under a charge of criminal treason, and acquitted.

ASSOIL, in our Ancient Law-Books, signifies to absolve, deliver, or set free from an excommunication. See Absolution.

ASSKO, in Geography, a town of Africa, the capital of Ifini, in an island of the same name, formed by the river Ilini; which is the ordinary residence of the king and his attendants.

ASSOM. See Assen.

ASSONANCE. In Rhetoric and Poetry, a term used where the words of a phrase, or verse, have the same sound or termination, and yet make no proper rhyme.

There are usually vicious in English; the Romans some-
times used them with elegance: “Militem comparavit, excitavit ordinavit, acem laetavit.”

The Latins call it eundem dicunt, and the Greeks èu- toia.

ASSONANT Rhymes. is a term particularly applied to a kind of versifying common among the Spaniards, where a resemblance of sound forms instead of a natural rhyme.

Thus ligas, callos, toros, mirgias, may adverce each other, in a kind of affonant rhyme, because they have each an in the penultimate syllable, and an a in the last.

ASSONGSONG, in Geography. See Island of Asumption.

ASSONIA, in Botany, a genus of plants, so named in honour of Ignatius de Ato, a Spanish botanist. Lin. gen. Schreb. n. 1123. Cavall. Diff. p. 120. Donbey’s, p. 121. Class, monadelphia duodecimtria. Nat. Ord. colom- nifera. Malvacea, Judd. Gen. Char. G. perianth double; outer three-leaved, unilateral, deciduous; inner one-leaved, five-parted; parts lanceolate, acute, ridged. Cor. petals five, roundish, narrowed at the base, spreading, withering, affixed to the pitcher of the flammae. Stem. filaments fifteen, filiform, upright, shorter than the corolla, conjoined at the base in the form of a pitcher; anthers oblong, subfusiform, erect; five linear-lanceolate, somewhat erect, coloured, petal-shaped, frappes between the flammae, proceeding from the pitcher. Pyl. germ roundish, five-furrowed; style simple, longer than the flammae, permanent; frigus five, recurved. Per. capit. fuliglobosum, or turbinate, five-celled; cells separable, bivalve. Seeds, solitary or in pairs, subovate. Old. Aftonia, with the outer perianth one-leaved, three-toothed, and with five fylles, does not seem separable from dombeya. With the outer perianth three-keaved, and a single fylle, any more than the hibicus dicoccus from the other hibici; or the one fylled fides, from the red; especially as dombeya oras cage, this the fylle divided almost to the base. We have therefore followed Schreber and Martyn in uniting dombeya with afora.

Species, t. A. populnea. Cavall. Diff. 120. t. 42. f. 1. “Leaves coriaceous, ovate-acuminate; flowers coriycync.” A small tree resembling Hibiscus populnea. The French call it bois de fonte, bleu ou galeux, because the wood is sweet-scented, and blue in the centre, and when old it becomes very hard. Leaves alternately scattered, large, entire, and hang obliquely; outer calyx so small as scarcely to be observed; petals small, oblong, obliquely fiddle-shaped, first white, afterwards fergous. A native of the isle of Bourbon, in hilly woods. 2. A. palmata, dombeya palmata, Cavall. l. c. “Leaves coriaceous, palmate, smoothish, lobes seven, acute, ferrate-crenate; flowers coriycync.” Stem arborescent; leaves alternate, on long footstalks; lobes oblong-acuminate; fylipes lanceolate, tomentose, deciduous; flowers in solitary peduncles, at the ends of the branches, tomentose; corolla an inch and a half wide, changing from white to a sulphur colour, and fally fragrious. A native of the isle of Bourbon, where it is called by the natives mahot-tantan.

3. A. acuangulara. Cavall. 1. c. “Leaves coriaceous, roundish, three-toothed, crenate; flowers racemose.” Stem arborescent; leaves alternate, of the length of the footstalks, seven-nerved, and commonly with an angular tooth between the base and lateral divisions; racemes solitary, axillary; calyces externally tomentose; corolla as that of the A. palmata (2), but veined and coriaceous; fruit pear-shaped. A native of the isle of Bourbon. 4. A. angulata, dombeya angulata. Cavall. 1. c. “Leaves coriaceous, roundish, angular at top, ferrate-toothed tomentose; umbels numerous; common peduncles shorter than the pedicel.” Arborescent; branches tomentose; leaves with three angles at the tip, seven-nerved; fylipes embracing
the item; umbels axillary, solitary; fruit globular, with two seeds in each cell. A native of the island of Bourbon. 5. A. tilifolius, dombeya tilifolia. Cav. l. c. "Leaves cordate, roundish-acute, crenate; flowers raceme-corymbed, arborescent." All the shrub very tomentose; leaves shaped like those of the common lime-tree, seven-nerved, tomentose; peduncles axillary, solitary, divided at the end into opposite horizontal racemes. A native of the island of Bourbon. 6. A. tomentosa, dombeya tomentosa. Cav. l. c. "Leaves cordate, roundish, crenate, tomentose, with almost circular veins, flowers umbelled." Stems arborescent, bristly; the whole tree very tomentose; follicles coriaceous, broad-ovate, acuminate, ciliate, half-vein clasping; common peduncle very long, forked at the top, and terminated by two umbels; petals roundish, sickle-shaped. A native of Madagascar. 7. A. punctata, dombeya punctata. Cav. l. c. "Leaves ovate-lanceolate, long, quite entire, tomentose underneath, rugged with dots on the upper surface." Trunk about the thickness of the human leg or thigh, covered with dark-brown bark; branches alternate, tomentose; leaves three or four inches long (sometimes crenulate or sinuate), rounded at the base; flowers on a long axillary common peduncle, umbelled, white, but becoming ferruginous by age; pedicels twenty or thirty, one-flowered. A native of the island of Bourbon. 8. A. decandra, dombeya decandra. Cav. l. c. "Leaves ovate-acuminate, repand-crenate, smooth; flaments five, two-thersed; flowers small, umbelled." Stem arborescent, with a brown furrowed bark; leaves alternate, clefted, four times as long as the petals; the outer calyx consists of three very small bristles; corolla rarely three lines in diameter; filaments five, five barbs, five forked; germ five-corned, one seed in each of the fruit. A native of Madagascar. 9. A. umbellata, dombeya umbellata. Cav. l. c. "Leaves cordate, ovate-oblong, acuminate, repand smooth; flowers umbelled, globular." A tree entirely smooth, with a brown bark; leaves longer than the petals, either repand about the edge, or obliquely and broadly crenate; common; peduncles solitary, axillary, on the tops of the branches ciliolate, very smooth, terminated by a single globose umbel. A native of the state of Bourbon, where ropes are made of the bark. 10. A. ovata, dombeya ovata. Cav. l. c. "Leaves ovate, toothed, five-nerved, tomentose; style very small." Stem shrubby, branched, covered with a ferruginous nap; leaves alternate, white underneath, rugged on the upper surface, double the length of the petals; follicles capillary, tomentose; pedicels forked at the top, with a coriand at each division; corolla small; petals narrow, roundish at the end, not sickle-shaped; their claws are permanent, and deeply ferruginous. Fruit globular, five-corned, within the segments of the calyx. A native of the island of Bourbon. 11. A. ferruginea, dombeya ferruginea. Cav. l. c. "Leaves ovate-oblong, seven-nerved, ferruginous beneath; petals, peduncles, and calyces tomentose." Stem arborescent, from eight to ten feet high; branches covered with a rufous nap; leaves on the extreme twigs, scattered alternately, acuminate, tooth-ferruginate, tomentose on the under surface; peduncles double the length of the petiole, forked at the top, with a many-flowered coriand on each division. This, perhaps, may be a variety of the A. ovata; the leaves, however, are much broader at the base, acuminate, seven-nerved, and very much toothed; whereas in that they are strictly ovate, five-nerved, and the teeth are dilate. A native of the island of Mauritius, and first discovered by Commerçon in 1769.

Assorus, in Ancient Geography, a town of Macedonia, in Mysiglöia. Ptolemy.—Assor, a town of Sicily, seated on a hill to the left of the river Chrysaus. Died. Sic.  

Assos, or Assos, a sea-port town of Asia Minor, in the Troad, fortified both by art and nature, according to Strabo. Acts xx. 15.  

Assos, or Assor, is now a sea-port of Asiatic Turkey, in Natothis, on a gulf of the Aegean sea, to which it gives name, four leagues S.E. from Tros, and eleven leagues west of Adramyttis. N. lat. 39° 18' long. 26° 1'.
ASS

affirma's. When one becomes legally indebted to another for goods sold, the law implies a promise that he will pay the debt and if it be not paid, 1. voluntary affirmation lies; and the same lies for goods sold and delivered to a stranger, and requisitions of the defendant in the price being agreed upon, and proved, Duns. Afr. 26, 27. If a tenant, being in arrear for rent, settles an account of arrears with his landlord, and promises to pay him the sum in money, an affimtum lies on this promise. Rule 3. 2. If a man and woman, being unmarried, mutually promise to marry each other, and afterwards the man marries another woman, by which he renders himself incapable of performing his contract, an affimtum lies, in which the woman shall recover damages. Carter, 253.

There are, however, five cases, specified by the statute of frauds and perjuries, 29 Car. II. c. 3, in which no verbal promise will be sufficient ground of action, without some note or memorandum in writing, signed by the party who is to become chargeable. 1. Where an executor or administrator promises to answer damages out of his own estate. 2. Where a man undertakes to answer for the debt, default, or miscarriage of another. 3. Where any agreement is made, upon consideration of marriage. 4. Where any contract or fact is made of lands, tenements, or hereditaments, or any interest therein. 5. Where there is any agreement that is not to be performed within a year from the time of its being made. In all these cases a mere verbal affimtum is void.

The consideration is the ground of the common action on the cause; and no such action lies against a man for a promise, where there is no consideration why he should make the promise.

Besides express contracts, there are others implied by law, and these are such as reason and justice dictate, and which, therefore, the law presumes that every man has contracted to perform; and, upon this presumption, to become answerable to such persons as suffer by his non-performance. Of this nature are, first, such as are necessarily implied by the fundamental constitution of government, to which every man is a contracting party. That is, that every person is bound and hath virtually agreed to pay such particular sums of money, as are charged on him by the statute, or ascribed by the interpretation of the law. By the same principle of implied original contract to submit to the rules of the community by which we are members, a forfeiture imposed by the bye laws and private ordinances of a corporation upon any that belong to the body, or an amercement set in a court-leet or court-baron upon any of the suitors to the court, create a debt in the eye of the law; and such forfeiture or amercement, unpaid, works an injury to the party or parties entitled to receive it, for which the remedy is by action of debt. The same reason may with equal justice be applied to all penal statutes, or such acts of parliament that inflect a forfeiture for transgressing the provisions enacted by them. A second class of implied contracts are such as arise from natural reason, and the just construction of law; and this class extends to all presumptive undertakings or affirmations, which, though never perhaps actually made, yet constantly arise from this general implication and intention of the courts of judicature, that every man hath engaged to perform what his duty or justice requires. Thus, if I employ a person to transact any business for me, or to perform any work, the law implies that I undertook or afforded to pay him so much as his labour deserved. If I neglect to make him amends, he has a remedy by an action on the cause upon this implied affimtum. The valuation of his trouble is submitted to the judgment of a jury, who will affix such a sum in damages as they think he really merited. This is called an affimtum on a "quantum meruit." There is also an implied affimtum on a "quantum valebit," for that case, where one takes up goods or works of another, without expressly agreeing for them. Here the law binds that one party did intentionally agree a certain rate of the goods he should pay; and if the action be brought accordingly, it is the vendor to pay that value. Another species of implied affimtum is when one has bold and received money belonging to another, without any verbal interlocution given of the necessary part; for the law construes this to be money had and received for the use of the owner only; and implies for the person so receiving affirm'd and undertook to account for it to the true proprietor. And if he unjustly detain it, an action on the cause lies against him for the breach of the implied promise and undertaking; and he will be made to repair the owner in damages, equivalent to what he has detained in violation of such promise. This is applicable to almost every cause where the defendant has received money, which is "ex aequo et bono" he ought to refund. 4 Barr. 1013.

Moreover, when a person has laid out and expended his own money for the use of another at his request, there arises a promise of repayment, and an action on this affirmation. Carb. 46. 2 Keb. 99. Also, upon a stated account between two merchants, or other persons, the law implies that he against whom the balance appears has engaged to pay it to the other, though there be no actual promise. From this implication, actions on the cause are frequently brought, declaring that the plaintiff and defendant had settled their accounts together, "infinitum computativa," which gives name to this species of affimtum, and that the defendant engaged to pay the plaintiff the balance, but has since neglected to do it. The last class of contracts, implied by reason and construction of law, arises upon the implication, that any one who undertakes any office, employment, trust, or duty, contracts with those who employ or entice him to perform it with integrity, diligence, and skill; and, if by his wanting either of these qualities, any injury accrues to individuals, they have their remedy in damages by a special action on the cause. If a sheriff does not execute a writ sent to him, or willingly makes a false return, the party aggrieved shall in both cases have an action on the cause for damages, to be assailed by a jury. Moor, 431. 2 Rep. 99. If a sheriff or gaoler suffers a prisoner, taken upon false process, or during the pendency of a suit, to escape, he is liable to an action on the cause; but, if, after judgment, a debtor charged in execution for a certain sum be permitted to escape, a gaoler or sheriff is compellable by action of debt for a sum liquidated and ascertained, to satisfy the creditor his whole demand, Rot. Weem. 2. 13 Edw. I. c. 11. and 1 Ric. II. c. 12. 2 Hen. 3. 582. An advocate or attorney betraying the cause of their client, or, being retained, neglecting to appear at the trial, by which the cause mili-carnes, are liable to assertion on the cause, for a separation to their injured client. Firch L. 188.

There is also in law an implied contract with a common innkeeper, to secure the goods of his guest; with a common carrier or stage-coach, to be answerable for the goods he carries; with a common carrier, that he shoves a horse well, without blaming him; with a common tailor, or other workman, that he performs his business in a workman-like manner; in which if they fail, an action on the cause lies for the recovery of damages for such breach of their general undertaking. 11 Rep. 54. 1 Sound. 324.

If an innkeeper, or other victualler, hangs out a sign, and opens his house for travellers, it is an implied engagement to entertain all persons who travel that way; and upon this universal affimtum an action on the cause will lie against him.
for damages, if he without good reason refuses to admit a traveller. 1 Veit, 232. If one cheats with false coins or dice, or by false weights and measure, or by selling one commodity for another, an action on the case lies against him for damages, upon the contract which the law always implies, that every transaction is fair and honest. 10 Rep. 36. In contracts for provisions, it is always implied, that they are wholesome, and if they be not, the fame remedy may be had. If cloth is warranted to be of such a length, it is not an action on the case lies for damages. Finch L. 189. Also, if a lease be warranted found, and the tenant foresees, he has been held that an action on the case lies to recover damages for this imposition. Salk. 611. Bl. Com. vol. iii. p. 158, &c. See Contract, and Promise.

ASSUMPTION, in Antiquity, a feast celebrated in the Roman church, in honour of the miraculous ascent of the Holy Virgin, as they describe it, body and soul into heaven.

ASSUMPTION, was also, among our ancestors, used for the day of the death of any faire: “quia ejus anima in coltum assumitur.” See Anniversary.

ASSUMPTION, in Geography, an episcopal city of South America, in the province of Paraguay, situated in the eastern division of the province, on a river of the same name, a little above the place where it is joined by the river Pilcomag. It was built by the Spaniards in 1538, and is distinguished by the fulness of its situation, by the fertility of the territory in which it stands, producing a great variety of native and exotic fruits in the highest perfection, and also by the number of its inhabitants, who are partly descendants of Spanish families that settled in the place, and partly Melitzos and mulattoes. This city lies about fifty leagues above the confluence of the Paraguay and Paruns, where the former begins to be called the river de la Plata. It is the residence of a governor appointed by the king of Spain, under the viceroy of Peru. Near the city is a lake, remarkable for having in the middle of it a rock, which rises to a prodigious height like an obelisk. S. lat. 25° 30’. W. long. 57° 40’.

ASSUMPTION, or Astenfong, one of the Marianne or Ladrones islands, situate according to La Perouse’s chart in N. lat. 19° 45’; and W. long. 145° 35’. It is a volcanic island, about three leagues in circumference; and its highest point is about 200 toises above the level of the sea. Its form is that of a perfect cone, whose surface, as far as forty toises above the level of the sea, is as black as coal. Some cocoa-nut trees occupy nearly a fifteenth part of the circumference of the island, for a depth of forty toises, which are in some measure sheltered from the east wind; and this is the only part of the island where it is possible to anchor, in a depth of water of thirty fathoms over a bottom of black sand, extending nearly a quarter of a league. The lava, flowing from the island, has formed precipices and hollows, bordered with a few flinted cocoa-nut trees, thinly scattered and mixed with limes and a small number of plants; and it has covered the whole circumference as far as a border of about forty toises towards the sea. The summit appeared to be vitriflated, resembling black glass, and its termination was concealed by clouds. Although no smoke was visible, the sulphurous fumes, which extended half a league out to sea, induced a suspicion that the fire of the volcano was not extinguished, and that its last eruption was not very ancient; more especially as there appeared no trace of decomposition in the lava, on the middle of the mountain. The island exhibits no appearance of having been ever inhabited, even by quadrupeds, much less by human beings. Some very large crabs were found here; and these, it is apprehended, have driven away the sea-birds, who lay on shore, and whose eggs they would devour. Some very fine falls were found in the hollows of the rocks; and three or four new species of the banana tree were collected. No fish was perceived, besides a red ray, some small sharks, and a sea-serpent, which might be three feet long, and three inches thick. No water could be procured in this desolate island, except some small quantity lodged in the hollows of the rocks. The sea gulls along the shore, and forms at every point a surf which renders disembarkation extremely dangerous. Voyage of La Perouse, vol. 1. p. 24. Eng. Transl. Lond. 1798.

ASSUMPTION, is also an island lying on the south-west coast of California, forming with a projecting point of land a bay, both on its north-east and south-east sides. N. lat. 26°. W. long. 120°.

ASSUMPTION, a river of North America, in New York, which falls in from the east into the lake Ontario, after a N.W. and W. course of about 25 miles; 5 miles S.E. from Pl. Gaverie.

ASSUMPTION, is a name sometimes given to the island Anticosti.

ASSUMPTION, in Logic, is the minor or second proposition in a categorical syllogism.

ASSUMPTION, is also sometime used for a conclusion drawn from the propositions whereof an argument is composed. Thus we say, the premises are true, but the assumption is censurable.

ASSUMPTIVE ARMS, in Heraldry. See Arms.

ASSURÉ, in Ancient Geography, an episcopal town of Africa, in the Transvaal province, placed by Antonine (Itiner.), on the road from Carthage to Sufatula, 108 miles from the former, and 42 from the latter.

ASSURANCE, Policy of. See Policy.

ASSURANCE, in Commerce. See Insurance.

We have also offices of assurance for life, where policies are granted for securing a sum of money on the extinction of any given life, in consideration of an adequate compensation either paid down in one sum, or by annual installments during the continuance of such life.

Assurances on Lives. By assuring a life is meant, obtaining security for a sum of money to be received should the life drop, in consideration of such a payment made to the assured, as shall be a sufficient compensation for the loss and hazard to which he exposes himself. In estimating this compensation, the amount of it will depend entirely on the rate of interest at which money is improved, and the probability of the duration of the life to be assured. If the interest be high, and also the probability high of the duration of the life, this compensation or premium of assurance will be proportionally low; on the contrary, if the rate of interest be low, and the probability of living be also low, the premium will be proportionally high. In order to explain this, let 100/. be suppose to be assured on a life for a year to come; that is, let 100/. be suppose payable a year hence, provided a life of a given age falls in that time. Were the interest of money at 5 per cent, and the life sure of failing, the value of the assurance would be the same with the present value of 100/. payable at the end of a year, reckoning interest at 5 per cent; that is, it would be that sum, which being now put out to interest at 5 per cent, would produce 100/. at the end of the year, or 95f. 4s. 8d. See Annuities, Tab. II.

On the contrary, if it be an even chance, or the odds be equal, whether the life does or does not fall in the year, the value of the assurance will be half the former value, or
ASSURANCE ON LIVES.

If the odds against its failing be two to one, that is, if it may be expected that some one of three lives, at the age of the given life, will fail in the year, the value of the assurance will be a third of the first value, reckoning the same interest, or 31/. 14s. 11d. If the odds be nineteen to one, or if it may be expected that one out of twenty lives, at the age of the given life, will fail in a year, the value of the assurance will be a twentieth part of the first value, or 4/. 17s. 3d.

If the odds be forty-nine to one, or if only one out of fifty such lives as the given life can be expected to fail in the year, the value of the assurance will be a fifteenth part of the first value; that is, it will be 1/. 18s. 11d. Now the odds of these things are, according to the Northampton Table of Observations (see Mortality), the odds that a life aged 22 will not drop in a year. The odds of 19 to 1 are the odds, according to the same table, that a life aged 65 will not drop in a year; and the odds of 49 to 1 are the odds that a life aged 39 will not drop in a year. It follows, therefore, that the value of the assurance of 100l. for a year on a life aged 52 is 31/. 14s. 11d.; on a life aged 65, 4/. 17s. 3d.; on a life aged 39, 1/. 18s. 11d. reckoning interest at 5 per cent. If interest be reckoned at 5 per cent, these values will be 32/. 7s. 3d.; 4/. 17s. 11d.; 1/. 18s. 11d.

The assurances most commonly practised are those on single lives, either for a given term, or during their whole continuance. When a life is assured for a given term or number of years, the value may be paid either in one single present payment, or in annual payments, to be continued till the failure of the life, should that happen within the term; or if not, till the determination of the term.

The method of finding these values cannot be easily understood by those who are unacquainted with the doctrine of life-annuities, as it has been taught by mathematicians; but the following observations may be of use to give some general idea of the subject.—Let us suppose that a person aged 39 years wants to assure 100l. on his life for 27 years, or till he be 65 years of age, and that he chooses to advance the proper compensation for it in a fixed annual payment, the first to be made immediately, and the following payments to be continued till either the term ends, or his life drops. The value of the assurance for the first year, is, by what has been already shown, 1/. 18s. 1d. reckoning interest at 5 per cent. The value of the assurance for the first year, of the sum due to the person, supposing him to have lived to the beginning of it, or to have completed 65, is likewise, by what has been already shown, 4/. 17s. 3d., reckoning all along at the same interest. If, therefore, the value of the assurance for the whole 27 years, is to be one constant sum payable at the beginning of every year, that sum, it is obvious, ought to be greater than the first, and 1/17 that the 65; or a sum which is some where between 1/. 18s. 1d. and 4/. 17s. 3d. The rule for finding this mean in all cases is the following:

"From the value of an annuity certain for the given term, found by Tab. III. under the article Annuities, subtract the value of the life for the given term, found by the method explained under the article Life-annuities, and reserve the remainder. Multiply the value of 1l. due at the end of the given term (found by Tab. I. under the article Annuities), by the perpetuity (see Remark II.), and also by the probability (see Mortality), that the given life shall fail in the given term. This product being added to the referred remainder, let the total be multiplied by the sum to be assured, and afterwards divided by the perpetuity increased by unity, then let this quotient be referred. Find next the value of an annuity on the given life for one year life that the given term, and the referred term, by the rate of interest, is divided by the last value, and the result will give the required value of the assurance for a fixed annual payment, till either the life fails, or the term ends."

Example.

Let the term be 27 years, the life aged 39, the sum 100l. and the interest 5 per cent.

Solution.

The value of the life of a person whose age is 39, for 27 years, is (reckoning interest at 5 per cent, and by the Northampton Table of Life-annuities) 11.191. This value is obtained from 14.643 (the value of an annuity certain for 27 years, for Tab. III. Annuities), leaves 3.452 the remainder to be referred. The value of 1l. to be received at the end of 27 years is 20.857, by Tab. II. under the article Annuities. The probability that the life of a person aged 39 shall fail in 27 years, is by the Northampton Table (see Mortality) 14.643. These numbers multiplied by one another, and 3.452 added to the product, make 6.508, which multiplied into 100l. the given sum, and divided by 21, the perpetuity increased by unity, gives 31.276 for the quotient to be referred.

The value of an annuity on a life of 39 for 26 years, is 11.019. Dividing therefore 31.276 (the referred quotient) by 12.019, or the value of the above annuity, with unity added, we have 2.606, or 2/. 12s., which is the required value, in fixed annual payments, of the assurance of 100l. on the given life for 27 years, reckoning interest at 5 per cent.

The value of the same assurance in one present payment is the quotient referred above, or 31/. 37s. 6d.; in other words, it is the value of an annuity of 2/. 12s. for 26 years on a life of 39; the first payment of which is to be made immediately, and the remaining ones at the beginning of each year; or, it is the sum arising in the foregoing operation before the division by the value of the life, for the term of 26 years.

If the assurance is to be made for the whole possible duration of the life, the method of finding the value will be more simple, and the rule for this purpose is as follows: "From the perpetuity subtract the value of the given life, and multiply the remainder by the given sum, and this last product divided by the perpetuity, increased by unity, will give the value in a single present payment. And this payment, divided by the value of the life, will give the value of the assurance in annual payments during the continuance of the life."

Example.

Let the age of the life be, as in the last example, 39; the sum to be assured for its whole duration 100l.; and the rate of interest 5 per cent. The value of the life, according to the Northampton Table (see Life-annuities) is 11.197. The value of the life subtracted from 20 (the perpetuity) is 8.021, which multiplied by 100, the given sum, and divided by 21, the perpetuity increased by unity, gives 38.195l. or 38/. 4s. for the value in a single payment of the assurance of 100l. for the whole duration of a life aged 39, reckoning interest at 5 per cent. And this payment divided by 11.197 is 3.388l. or 3/. 3s. 9d. the value of the same assurance in annual payments during the continuance of the life.

Remark I.

If the value of the assurance is desired in annual payments, the first of which, instead of being made at the end of the year as the preceding rule supposes, is to be made immediately, the value in a single payment (found as directed above) must be divided by the value of the life increased by unity; that
ASSURANCE ON LIVES.

That is, in the present instance, by 12.97, which will make the required value of the assurance 2471.44. Instead of 5, 1832, or 21, 181, 106, instead of 5, 17, 96.

The reader of adding unity to the values of lives taken from the tables is, that in all the tables the values of annuities on lives are given on the supposition that the first payment is not to be made till the end of a year. If, therefore, the first yearly payment is to be made immediately, the value must exceed that in the table by one year's pur-

Remark II.

The perpetuity means the value of the fee-simple of an estate, which is found by dividing 100, by its interest for a year. For example, if the rate of interest be 5$, per cent, 100, divided by 5 gives 20, for the perpetuity; if the rate of interest be 4, 5$, or per cent. 100, divided by 4, 5$, or 5, will give 25, 38.57$, or 33.33$, for the perpetuity.

Remark III.

Instead of a gross sum, an estate or a perpetual annuity is to be assured during the whole duration of a life, the value in a single payment will be “the value of the life subtracted from the perpetuity, and the remainder multiplied by the annuity, or by the rent of the estate.”—And the value in annual payments beginning immediately will be “the single payment divided by the value of the life increased by unity.”

—Universally, it ought to be remembered that the assurance of an estate or annuity after any given life or lives, is worth as much more than the assurance of a corresponding sum at 100, increased by its interest for a year is greater than 100.—Thus the present values, in single and annual payments, of the assurance of an estate of $5, per annum, for ever, and of 100, in money on the whole duration, or on any part of an afflicted life, are to one another (interest being at 5 per cent.) as 106$ to 100.$ The reason of the difference is, that the algebraical calculations, by which these values are determined, suppose that the gross sum and the first yearly payment of the annuity are to be received at the same time after the extinction of the lives. It is easy to see, that this is a circumstance which must make the latter of more value.

This specimen is sufficient to explain the general nature and principles of assurances on single lives, and to teach in all cases the method of finding the values of such assurances. To those who wish to be further informed on this subject, it may not be improper to add the following mathematical demonstrations of the rules which have been given above.

Let $a$ be the number of persons living at the age of any given life $A$; let $a, a', a''$, &c. be the number of persons who have died in the 1st, 2d, 3d, &c. year after the age of $A$; let $r$ be 1, increased by its interest for a year, and $S$ the sum to be assured. The probability that $A$ dies in the 1st year is $\frac{a'}{a}$; the value therefore of the assurance in that year is $\frac{S a'}{ar}$. The probability that $A$ dies in the 2d, after having survived the 1st year, is $\frac{a''}{a}$, and consequently the value of the assurance in the 2d year is $\frac{S a''}{ar^2}$.

In like manner, the value of the assurance in the 3d, 4th, 5th, &c. years, supposing $n$ to denote the number of persons who have died in the $n$th or last year, is $\frac{S a''}{ar^2}, \frac{S a''}{ar^3}, \frac{S a''}{ar^4}$, &c. and $\frac{S_m}{ar^n}$ respectively. The whole value, therefore, of the assurance for $n$ years is $S \times \frac{a'}{ar} + \frac{a''}{ar^2} + \frac{a'''}{ar^3} + \ldots + \frac{a^n}{ar^n}$.

But the series $\frac{a'}{ar} + \frac{a''}{ar^2} + \frac{a'''}{ar^3}$, &c. is $= \frac{1}{r} - \frac{a - a'}{ar^2} - \frac{a - a' - a''}{ar^3} - \ldots = \frac{a - a' - a'' - \ldots - a^n}{ar^n}$.

.... $= \frac{1}{r} + \frac{\alpha}{ar^n}$ (supposing $l$ to be the number of persons who have died in the $n - 1$st year). The series $\frac{a'}{ar} + \frac{a''}{ar^2} + \frac{a'''}{ar^3}$, &c. is $\frac{a - a'}{ar^2} + \frac{a - a' - a''}{ar^3} + \ldots = \frac{a - a' - a'' - \ldots - a^n}{ar^n}$.

The value of any annuity on the life of $A$ for $n$ years, and the series $\frac{1}{r} + \frac{1}{r^2} + \frac{1}{r^3} + \ldots + \frac{1}{r^n}$ to express the value of an annuity certain for $n$ years. Call the first of these series $A$, and the second $N$, then will the whole of the above series be $N - A = \frac{N}{r} + \frac{A}{r^2} + \ldots + \frac{a - m}{ar^n - 1}$

$\times N - A + \frac{1}{r} + \frac{m}{ar^n}$, Now since $\frac{1}{r - 1}$ is equal to the perpetuity (or $p$), $\frac{1}{r - 1} = \frac{1}{p} + 1$, hence the whole value of the assurance of $S$ for $n$ years will be $S \frac{1}{p} + 1 \times N - A + \frac{m}{ar^n}$, agreeable to the rule given above.

If the assurance be for the whole continuance of life, the fraction $\frac{m}{ar}$ vanishes, $N$ becomes equal to the perpetuity, and $A$ to the value of an annuity for the whole life of $A$, so that in this case the expression becomes simply $\frac{S}{p} + 1 \times p = A$, which is the rule given in words for finding the value of an assurance on the whole possible duration of the life of $A$.

If the assurance be that of an estate or a perpetual annuity, the value of each payment of such annuity depending on the failure of the life of $A$ in one, two, three, &c. years to $n$ years will be $1 - \frac{a'}{ar} - \frac{a''}{ar^2} - \frac{a'''}{ar^3} - \ldots - \frac{a^n}{ar^n}$, and the value of the fee-simple after $n$ years, depending on the contingency of $A$ having died in the mean time, will be $\frac{m}{ar^n}$; the whole value, therefore, of the assurance will be $\frac{N - A + \frac{m}{ar^n}}{p}$. multiplied into the annuity; or simply $p - A$ multiplied into such annuity, if the assurance is to be continued during the whole duration of $A$'s life. For the more ample discussion of this subject, the reader is referred to Mr. Simpson's "Select Excerpts," Dr. Price's "Treatise on Reversionary Payments," and Mr. Morgan's "Doctrine of Annuities and Assurances stated and explained."

Assurances may be made on any number of joint lives, or on the longest of any lives. Rules for finding the values of such assurances...
ASSURANCE ON LIVES.

affurances are given in the books just referred to.—There are further affurances on survivorships; by which is meant an obligation for the value received, to pay a given sum or annuity, provided a given life shall survive any other given life or lives. The method of finding these values is given under the article Survivorship.

All these different kinds of affurances are of the greatest use; and the offices for making them are a particular advantage to the public. The principal of these offices is in England are, the Amicable Society, incorporated for a perpetual affurance; the Society for Equitable Affurances on Lives and Survivorships; the Royal Exchange Affurance; the Westminister and the Pelm Life-Offices. The Amicable Society requires an annual payment of 5l. from every member, payable quarterly during life. The whole annual income hence arising is equally divided among the representatives of such members as die every year; and this renders the dividends among the claimants in different years more or less according to the number of members who have happens to die in those years. But this society engages that the dividends shall not be less than 150l. to each claimant, though they may be more.—None are admitted whole ages are greater than 45, or less than 12; nor is there any difference of contribution allowed on account of difference of age. This society has fubsidized ever since 1706, and its credit and usefulness are well etablishe— Its plan, however, is liable to several objections.—First, it is evident that regulating the dividends among the representatives by the number of members who die every year, is not equitable; because it makes the benefit which is to accrue from the affurance, to depend, not on the value of the contribution, but on a contingency, that is, on the number of members who have happened to die in the year. Secondly, its requiring the same payments from all persons under 45, is also not equitable, for the payment of a person admitted at 12 ought not to be more than half the payment of a person admitted at 45.

Thirdly, by limiting the sums assured on one and the same life to 450l. it is but ill adapted to make a competent provision for the families of its members; nor can it be of any service to persons whose whole age exceeds 45 years; a period of life, which it has been found from experience that many, if not most persons, have exceeded beyond by they have begun to provide for their families by affur- ing on their lives. It is likewise by no means suited to the circumstances of persons who want to make affurances on their lives for only one year, or for a short term of years. Thus, the true value of the affurance of 150l. for five years on the life of a person whose age is 39, may be found by the first rule to be nearly three guineas per ann. lumping interest at 3 per cent., and the probabilities of the duration of human life as they are given in the Northampton Table of Observations. But such an affurance could not be made in this society without an annual payment of 5l.

Neither is the plan of this society at all adapted to the circumstances of persons who want to make affurances on particular survivorships. For example, a person poffesses of an estate or salary, which must be left with his life, has a person dependent upon him, for whom he desires to secure a sum of money payable at his death. But he desires this only as a security against the danger of his dying first. In these circumstances he enters into this society, and by an annual payment of 5l. entitles his nominee at his death to 150l. In a few years, perhaps, his nominee happens to die, and the object of his affurance having thus ceased, he determines to give up the advantage arising from his former payments and to withdraw from the society. The right method in this case would have been to have taken from such a person the true value of the sum assured on the supposed fee simple of non-pay- ment, provided he should survive." Had this been done, he would have paid for the affurance (lumpsum interest at 3 per cent. his age 39, the age of his nominee also 39, and the value of lives as given by Dr. Price from the Northampton Table) 3l. 6s. 8d. in annual payments, to begin immediately, and to be continued during the joint duration of his own life and the life of his nominee.

None of these objections, however, are applicable to the other offices just mentioned. In all of them affurances may be made for any term and at any age between eight and fifty-seven years, either at single or annual premiums, pro- portioned to the age of the person assured, and to the risk or hazard attending the affurance. The policies transferred in these offices is very extensive, and so far as relates to the premiums they require, is founded on strict calculation. These premiums, which are now indiscriminately adopted by all of them, were originally computed in the year 1781 for the use of the Equitable Society,—an institution to entirely guilid by competition in all its practice, that in certaining its profits at fixed periods, and distributing them among its members, it has never failed to proceed on the same sure principles, and by this means to render itself one of the greatest public benefactors to this country. In consequence of the immense capital, and the very wide extent of its business, it certainly far exceeds any other office of the same kind; and therefore by giving an account of its lives and profits, a proper idea will be obtained of the nature of life assurances, as well as of the important annuities which are derived from them.

This society was established in the year 1762, in conference of proposals which had been made, and lectures recom- mendings such a design, which had been read by Mr. Thomas Simpson; and the premiums then adopted for its practice were computed by Mr. James Dodson, the author of the Mathematical Repository. It affures any sums or reversionary annuities on any life or lives, for any number of years, as well as for the whole continuance of the lives, and in any manner that may be best adapted to the views of the persons assured; that is, either by making the affurred sums liable to the failure of any given lives, or on condition of surviving years; and also, either by taking the price of the affurance in one present payment, or in annual payments during any single or joint lives, or any term less than the whole possible duration of the lives. Any persons, for instance, who depend on incomes which must be lost when they die, or who are only tenants for life in others, may, by affuring an equivalent on their own lives, guard their families or represeatives against the loss which would accrue by their death. Hence, clergymen, confessors, parsons holding any places of profit, tenant, and others who have families whose subsistence depends on the continuance of their lives, may be enabled to make provision for their families after their decease. All persons likewise who enjoy annuities for the lives of others, may here feasible provision against the risk they would sustain, had they by surviving the persons on whose lives the annuities depend, by making affurances which would entitle them to any sums payable on condition their survivorship should take place. Any person entitled to an estate, annuity, legacy or office after another person provided he survives, may here feasible an equivalent for his family at his decease, provided he does not survive. Hut- thes may in this matter Footnotes for their wives, provided they should have them widows. Parents, by affur- ing the lives of their children, when infants, till they attain a given age, may secure for them, should they live to that age, such sums as may be necessary to put them out to appren- ticeships, or to make capitals or fortunes for them, with which to set out in business, or to marry. Any persons, apprehensive of being left without support in old age, when in- capable.
ASSURANCE ON LIVES.

Incapable of labour, many parents purchase in advance an annuity to commence in any future year of his life, and to continue during the remainder of his days, and he may do this at a small expense if he is young, and willing to wait for the commencement of his annuity, till he is fifty-five or sixty years of age. In short there are no kinds of assurance on lives or survivalships which this society does not make. In proceeding on mathematical principles in computing its premiums, it takes advantage of making these computations at so low an interest as 3 per cent., in order to gain such a profit as shall enable it to bear the expenses of management, and render it a permanent benefit to the public. In the infancy of the institution also, it adopted tables of the values and probabilities of lives in London, where, as in all great towns, the rate of human mortality is much greater than it is among mankind in general. But after an experience of twenty years, it found that the tables giving higher probabilities of life might be fairly used, and therefore it made choice of those three correct tables which were published by Dr. Price from observations at London burying, and it appears, from comparing the deductions of life in the society with those in the table just mentioned that, during a term of thirty-four years, the rates of mortality in the former is to that in the latter between the ages of 10 and 20 as 1 to 2

and 30 as 3 to 5

and 50 as 3 to 5

and 70 as 3 to 4

or that in all ages between 10 and 80, fewer deaths have happened in the society than should have happened according to the tables from which its premiums have been computed in the proportion of two to three. In consequence of this and of other still less equivocal proofs of its prosperity, the society has been enabled since its first establishment not only to reduce its premiums above one half, but to make such additions to the sums called for in the years 1782, 1786, 1791, 1793, 1795, and 1800, as amount at present to the sums specified below:

These are advantages peculiar to this society, and therefore it is no wonder that its business should so far surpass that of every other institution of the same kind. But in the midst of its prosperity the society has hitherto proceeded with the utmost prudence and caution. Aware of the danger of being led astray by the dazzling appearance of a large capital, necessarily increased by an influx of new members, it has provided by a special law, that, as on former occasions, so in future, no distribution of its stock shall ever be made without a previous investigation of its hazards; that this investigation shall take place once in ten years; that the distribution shall never exceed two-thirds of the surplus stock of the society; and that no such distribution shall be adopted at all without the concurrence of four-fifths of its members, attending at three successive general courts. As far as human prudence and foresight can provide against danger, these precautions are likely to secure the society, and to increase its usefulness. But there is one danger against which no laws can guard it: we mean the danger of employing ignorant persons to conduct the management of its affairs. It must be manifest from the preceding account of this society, that none but skilful mathematicians are qualified for this business; and it is to be hoped that on any future vacancies, no other regard will be had in filling them up, than to the ability and integrity of the candidates. The melancholy experience of other societies for the benefit of age, for the benefit of widows, &c. which were established about thirty years ago, and which have long since ended in disappointment and ruin, should serve to guard this society against the attempts of ignorance, as much as the prudent state of its affairs should induce it to persevere in that wise and temperate course which has displayed so much prudence and skill in the management of its affairs, and raised it so high in the opinion of the public.

The following are the rates of assurance on single lives in this society, and also very nearly in the Royal Exchange, and other offices, where those premiums have been adopted with little or no variation.

ASSURANCE ON LIVES.

ASSURANCE, Royal Exchange, is a corporation or company established by an act 6 Geo. 1. c. 18.; and, by their charter, executed June 22, 1720, empowered to afford ships and goods at sea, or going to sea, and to lend money on bottomry; and, for this purpose a capital of 1,500,000l. on condition that, upon three years’ notice being given by parliament, at any time within thirty-one years from the date of the charter, and repayment of the sum of 500,000l., which the company had agreed to pay to government, the corporation should cease. In the following year they obtained another charter, dated the 29th April 1721, by which they were authorized to afford lives, and also to affrere houses and goods from fire, and were empowered to raise a further capital of 500,000l. making with the former sum, two millions. It was also enacted, that, in consequence of the company having paid into the exchequer 111,250l. and having canvassed to pay the farther sum of 38,750l. within three months, they should be released from payment of the remainder of the 300,000l. The whole capital of 2,000,000l. was subscribed, but it was thought necessary to call for the payment of only 500,000l.; which, after paying the 150,000l. to government, had been found sufficient for carrying on the extensive concerns of the company. A new branch was added to their business, by an act, obtained in 1793, enabling them to grant and purchase annuities on lives, either immediate or in reversion; and, in 1801, the company obtained an act for affrere ships and their cargoes on canals and inland navigations, in which act the London Assurance company are likewise included.

The dividend to the proprietors, which has gradually increased from 3 to 7½ per cent., becomes due at Christmas and Midsummer, and is usually paid about the 15th January and July. [At Midsummer 1802, an occasional dividend was made in reck, being 10½ per cent. 1757, for every 100l. of the company’s flock.] The transfer-days are Tuesdays and Thursdays, between the hours of eleven and one. The dividends are paid on Mondays, Wednesdays, Fridays, and Saturdays, from ten to two.

N. B. The foregoing Annuities are receivable in Quarterly Payments; and they vary at different times according to the current rate of Interest.
The person making the assurance is to declare the place and date of birth of the person whose life it is to be assured; whether he has had the small-pox; whether subject to the gout; and whether it is the ass or annuity.
The measure to appear at the office, or to one of the company's agents, or pay
25 per cent. on assurances for one year, by
35 per cent. for more than one year, and 5 per cent. not exceeding five years, by
5 per cent. if for more than seven years, only.
Nine quarter per cent. addition, will be taken on the first payment as admission-money.
Assurances are allowed for payment of the annual premium after they respectively become due, but if the time extends it more than the said fifteen days, and not exceeding three calendar months, a fine of ten shillings per cent. shall be paid, and a warranty given of the health of the life assured.

Conditions of Assurance made by Persons on their own Lives.
The assurance to be void if the person whose life is assured shall depart beyond the limits of Europe, shall die upon the sea (except in his majesty's packets passing between Great Britain and Ireland); or shall enter into or engage in any military or naval service whatever, without the previous consent of the company; or shall die by suicide, duelling, or the hand of justice; or shall not be, at the time the assurance is made, in good health.

Conditions of Assurance made by Persons on the Lives of others.
The assurance to be void if the person whose life is assured shall depart beyond the limits of Europe, shall die upon the sea (except in his majesty's packets passing between Great Britain and Ireland); or shall enter into or engage in any military or naval service whatever, without the previous consent of the company; or shall not be, at the time the assurance is made, in good health.—Any person making an assurance on the life of another, must be interested therein, agreeable to Act 14 Geo. III. c. 48, which prohibits wagering, or speculative insurances.

N.B. Assurances on the lives of persons engaged in the army or navy, or going beyond the limits of Europe, may be made by special agreement. See Life-Assurances, and Life-Assurance.

Assurance, London. The charters of this company were granted at the same time with those of the Royal-Exchange Assurance, for the same purposes, and upon similar conditions; one of which is, that no peron poaching flock in either company can purchase flock in the other, under penalty of forfeiting the share so purchased. The principal difference in the business of the two offices is, that the London assurance confine themselves to sea and fire assurances, very seldom affording lives, and not being empowered to grant annuities. Their flock is 1,000,000. divided into shares of 25%. each, on which 1%. has been paid in, making the whole sum paid in 300,000. The dividend has been raised to 18%, per share annum, and becomes due at Lady-day and Michaelmas. The transfer-days are Tuesdays and Thursdays, from eleven to three o'clock. The dividends are paid on Mondays, Wednesdays, and Fridays, from eleven to three.

Assurance, Collateral, in Law. See Collateral Assurance. Assurances, Common, of the kingdom, express the legal evidences of the conveyance or transmission of property; by which every man's estate is assured to him, and all controversies, doubts, and difficulties, are either prevented or removed. These common assurances are of four kinds: 1. By matter in praia, or deed, which is an assurance transferred between two or more private persons in praia, in the country that is, according to the old common law, upon the very spot to be transferred. See Deed. 2. By matter of record, or an assurance transferred only in the king's public records of record. See Record. 3. By special custom, obtaining in some particular places, and relating only to some particular species of property. See Custom. These three assurances are such as take effect during the life of the party conveying or assuring. 4. The fourth takes no effect till after the death, and that is by devise, contained in his last will and testament. See Deeds and Will. Bu. Law, p. 255.

Assurant, in Heraldry, a term used for a man or beast riving out of the fen.

Assuror, a merchant or other person, who affirms or makes out a policy of assurance for a ship, house, life, or the like. Affurors are not answerable for what damages arise through the negligence, or other fault of the master or seamen; or even those which arise from any vice or defect in the thing assured. See Insurance.

Assurritani, or Assurrani, in Ecclesiastical History, a branch of Donatists in the middle of the fourth century. The Assurritani maintained the fcn to be inferior to the father; they re-baptized their converts from the catholics, and affected that the church is not composed of good and bad, but of the good alone.

Assurus, or Assuras, now Kiffer, in Ancient Geography, a town of Africa, sittuate in the island country of the ancient Bizzarum, to the west of Adrametum, and south-east of Sicca Veneria.

Asny, in Geography, a town of France, in the department of the Oise, and chief place of a canton in the district of Cracpy, eight miles south of Cracpy.

Assyani, in Ancient Geography, an ancient town of the Tauric Chersonesus.

Assyria, a kingdom of Asia, of the extent, origin, and duration of which very different accounts have been given by ancient writers. Ctesias and Diodorus Siculus affirm, that the Assyrian monarchy, under Nineus and Seniramus, comprehended the greater part of the known world; but, if this had been the case, it is not likely that Homer and Herodotus would have omitted a fact so remarkable. The sacred records intimate, that none of the ancient states or kingdoms were of considerable extent; for neither Chalderonner, nor any of the neighbouring princes, were tributary or subject to Assyria; and we find nothing, says Plutarch, of the greatness or power of this kingdom in the history of the Judges, and succeeding kings of Israel, though the latter kingdom was oppressed and enslaved by many different powers in that period. It is therefore highly probable, that Assyria was originally of small extent. According to Ptolemy, this country was bounded on the north by part of Armenia and mount Niphates; on the west by the Tigris; on the south by Susiana; and on the east by part of Media, and the mountains Choatra and Zagros. The country within these limits is called, by some of the ancients, Adiabene, and by others Aturia or Atoria. It is divided, by Ptolemy, into the following provinces or districts; viz. Caucanian or Calicine, Arachaitis, Adiabene, Arabites, Apollonia, Sittacene, and Chaloditis. Among the rivers of Assyria we may reckon the Tigris, the Lycus, the Caprus, and the Gorgus.
AS SYRIA.

Gorgan. Of the origin, revolutions, and termination of Assyria, properly so called, and distinguished from the grand monarchy which afterwards bore this appellation, the following account is given by Mr. Playfair, as the most probable. The founder of it was Ashur, the second son of Shem, who departed from Shinar, upon the usurpation of Nimrod, at the head of a large body of adventurers, and laid the foundations of Nineveh, where he refided, and erected a new kingdom, called Assyria after his name. See Ashur, Gen. x. 11. These events happened not long after Nimrod had established the Chaldaean monarchy, and fixed his residence at Babylon: but it does not appear that Nimrod reigned in Assyria. The kingdoms of Assyria and Babylon were originally distinct and separate (Micah, v. 6.); and in this state they remained until Ninus conquered Babylon, and made it tributary to the Assyrian empire. Ninus, the succeller of Ashur, Gen. x. 11. Died, Sicul: l. 1., from a disease on Chaldea, after the death of Nimrod, and united the kingdoms of Assyria and Babylon. This great prince is said to have subdued Asia, Persia, Media, Egypt, &c. If he did do, the effects of his conquests were of no long duration; for, in the days of Abraham, we do not find that any of the neighbouring kingdoms were subject to Assyria. Ninus was succeeded by Semiramis, a prince bold, enterprising, and fortunate; of whose adventures and exploits many fabulous relations have been recorded. Playfair is of opinion, that there were two princesses of this name who flourished at different periods: one, the confort of Ninus, and another, who lived five generations before Nicatoris, queen of Nebuchadnezzar. Euseb. Chron. p. 58. Herod. i. c. 184. See SEMIRAMIS. Of the successors of Ninus and Semiramis nothing certain is recorded. The last of the ancient Assyrian kings was Sardanapalus, who was besieged in his capital by Arbaces, governor of Media, in concurrence with the Babylonians. Those united forces defeated the Assyrian army, demolished the capital, and became masters of the empire, B. C. 621. See ARBACES, and SARDANAPALUS. Such is the substance of the account given by Ctesias, and after him by several ancient Greek and Latin writers; and particularly by Diodorus Siculus. These writers have referred the commencement of the Assyrian empire to about thirty or forty years after Noah's flood; but concerning its beginning, as well as its duration, ancient writers have given very different accounts. Africanus and Eusebius suppose that Ninus, the second Assyrian king, began to reign 500 years after the flood, and 433 years before the birth of Abraham. Berosus, the Chaldaean historian, dates the foundation of the empire from the building of the tower of Babel, about 311 years after the flood. Caifiadorous admits an interval of more than four centuries between these two remarkable events. Usher extends this interval to 1085 years; and Jackson reduces it to 531. As to the period of the duration of this empire, Ctesias, Diodorus, and others, make it 1560 years: Justin, 1500; Caflor, 1520; Syncellus, 1560; Scaliger, 1526; Eusebius, 1520; Velleus Paternus, 1570; Herodotus, 520; and Appian makes the whole duration of the Assyrian, Median, and Persian empires, not to exceed 500 years. In Ilius's Tables the commencement of the Assyrian empire is alligned to the year before Christ, 2059, and its termination to the year before Christ 829; so that its whole duration comprehends 1230 years. Geygnet refers the conquest of Babylon by Ninus, king of Assyria, and the consequent union of the Babylonian throne with that of Nineveh, to the 950th year after the flood, or the 1758th year B. C. In setting this date, he places the foundation of the kingdom of Babylon by Nimrod, about the year 150 after the flood. This king, dom, as most chronologists allow, had fulfilled 450 years, under two distinct dynasties or families, at the time of Babylon's being taken by the Assyrians. The first of these dynasties, whose kings were Chaldeans, possessed the throne 225 years; and the second, originally from Arabia, reigned 215 years; and the total is 440 years. If to these years we add 150 years from the flood to the foundation of Babylon by Nimrod, the capture of Babylon will fall in the 590th year after the flood, and consequently in the 1758th year B. C. As most of these computations are primarily borrowed from Ctesias, it may not be improper to inquire how far his testimony is credited. Aristeas, who was almost his contemporary, declares him to be unworthy of credit; and his history of India excites him to be a fabulous writer. Although he gives us the names of the Assyrian kings from Babel and his son Ninus to Sardanapalus, the last king of that monarchy, yet his list is a mere medley of Greek, Persian, Egyptian, and other names; and except in two or three instances, they have no affinity with the names of the Assyrians mentioned in scripture. The true empire of the Assyrians, described in scripture, whole kings were Pul, Tiglath-pileser, &c. he does not mention, though much nearer to his own times; and this circumstance shows that he was ignorant of the antiquities of the Assyrians.

After the death of Sardanapalus, says Mr. Playfair, the Assyrian empire was divided into three kingdoms; viz. the Median, Assyrian, and Babylonian. Arbaces retained the supreme authority, and nominated governors in Assyria and Babylon, who were honoured with the title of kings, while they remained subject and tributary to the Persian monarchs. Belshas, he says, a Chaldaean prince, who assisted Arbaces in the conquest of Sardanapalus, received the government of Babylon as the reward of his services; and Pul was entrusted with that of Assyria. The Assyrian governor gradually enlarged the boundaries of his kingdom, and was succeeded by Tiglath-pileser, Saladanassar, and Sennacherib, who affected and maintained their independence. After the death of Assur-haddon, the brother and successor of Sennacherib, the kingdom of Assyria was split, and annexed to the kingdom of Media and Babylon. Several tributary princes afterwards reigned at Ninus, but we hear of none more of the kings of Assyria, but that of Babylon. Cyshurnes, king of Media, allied Nebuchadnezzar, king of Babylon, in the siege of Nineveh, which they took and destroyed B. C. 606.

The history of Assyria, deduced from scripture, and acknowledged as the only authentic one by sir Isaac Newton and many others, ascribes the foundation of the monarchy to Pul or Phil, about the second year of Menahem, King of Israel, twenty-four years before the year of Nabonassar, 1750 years after the flood, and according to Blair 769, or according to Newton 750, years before Christ. Menahem having taken forcible possession of the throne of Israel by the murder of Shallum (2 Kings, x. 10.), was attacked by Pul, but prevented the hostilities on his direction against him, by presenting the invader with a thousand talents of silver. Pul, thus gratified, took the kingdom of Israel under his protection, returned to his own country after he had received vassalage from several nations in his march, as he had done from Israel, and became the founder of a great empire. As it was in the days of Pul that the Assyrians began to afflict the inhabitants of Palestine (2 Kings, xi. 19, and 1 Chron.
ASSYRIA.

14. and far Kings, the " and 72. who v. Nebuchadnezzar 26. 63,) Thus and 3. i/s and Kings, 9. Newton, evident other preferitly the quells bv was «'rcat Haddon, nacherib kings, to of the kingdom, i 1. txcene, Affyria, be of Arabia, and reaching eastward into Elymais, and Par- tenece, a province of the Medes, and if Chalced and Chabor be Colchis and Iberia, as some think, and as may be probable from the circumstance used by those nations till the days of Herodotus (L ii. c. 104.), we are also to add these two provinces, with the two Armenias, Pontus, and Cappadocia, as far as to the river Halys. For Herodotes (L i. c. 72. l. vii. c. 65.) tells us, that the people of Cappadocia, as far as to that river, were called Syrians by the Greeks, both before and after the days of Cyrus; and that the Assyrians were also called Syrians by the Greeks." After-Hadon was succeeded in the year B. C. 668, by Saofuchinus. At this time Manaffel was allowed to return home and fortify Jeru- salem; and the Egyptians also, after the Assyrians had harassed Egypt and Ethiopia three years (I tim. xx. 3. 4;) were fet at liberty. Saofuchinus, after a reign of twenty years, was succeeded at Babylon, and probably at Nineveh also, by Chyniladon, in the year B. C. 647. This Chyniladon is sup- posed by Newton to be the Nabuchadonosor mentioned in the book of Judith (1. 1. 15.), who made war upon Arphaxad king of the Medes, and though defeated by his auxiliaries Chlon, Damaskas, Syria, Phoenicians, Medes, and Egyptians, routed the army of the Medes, and flew Arphaxad. This Arphaxad is supposed to be either Deojes, or his son Phraorites, mentioned by Herodotus (L i. c. 102.). Soon after the death of Phraorites in the year B. C. 635, the Scythians invaded the Medes and Perians; and in 625 Nabopolasfar, the commander of the forces of Chyniladon in Chaldæa, revolted from him, and became king of Babylon. Chyniladon was either then, or soon after, succeeded at Nineveh by the last king of Assyria, called Sarae by Poly- histor. The authors of the Universal History suppose Saof- chinus to have been the Nabuchadonosor of Scripture, and Chyniladon or Chyniladon to have been the Sarae of Poly- histor. At length Nebuchadnezzar, the son of Nabopolas- far, married Anuyte, the daughter of Allages king of the Medes, and founded a new empire. At first, the families having contracted affinity, they confined against the Assyrians. Nebopolasfar being old, and Allages dead, their sons Nebuchadnezzar and Cyaxares led the armies of the two nations against Nineveh; slew Sarae, destroyed the city, and shared the kingdom of the Assyrians. This victory the Jews refer to the Chaldæans; the Greeks, to the Medes; Tobit (xiv. 15.), Polyhistor (apud Euseb. in Chron.), Josephus i. x. c. 2. § 2. p. 435.; and Ctesias (apud Dio- Dyd. Sic. L ii. c. 24. p. 78.), to both. With this victory commenced the great succes of Nebuchadnezzar and Cyaxares, and it laid the foundation of the two collateral empires of the Babylonions and Medes, which were branches of the Assyrian empire; and hence the time of the fall of the Assyrian empire is determined, the conquerors being then in their youth. In the reign of Josiah, when Zephaniah prophesied, Nineveh and the kingdom of Assyria were decaying, and their fall was predicted by that prophet, Zeph. i. 3. and ii. 13. And in the end of his reign, Pharaoh-Necho king of Egypt, the successor of Phammitus, went up against the king of Assyria to the river Euphrates, to fight against Car- chemish or Circumitus, and in his way thither flew Josiah (2 Kings, xxiii. 29. 2 Chron. xxxiv. 20.) and therefore the last king of Assyria was not yet slain. But in the third and fourth year of Jehoiakim, the successor of Josiah, the two conquerors having taken Nineveh and finished their war in Assy- ria, proceeded their conquests westward; and leading their forces against the king of Egypt, as an invader of their right of conquest, they beat him at Carchemish, and took from him whatever he had recently taken from the Assyrians (2 Kings, xxiv. 7. Jer. xvi. 2. Eupolemus apud Euseb. Prep. L ii. c. 35.;) and therefore we cannot err, says Sir Isaac Newton, about a year or two, if we refer the destruction of Nineveh, and fall of the Assyrian empire, to the third year of Jehoiakim, or the 149th, or, according to Blair, the 141st year of Na- bopolasfar, that is the year 667 B. C. Newton fuggrets, that the name of the last king Sarae might have been contracted from Carshon; as this name was from Aberdon, Aber- hadon-Pul, or Sardanapalus; but how, says his learned commentator, bishop Horley, is this confullent with what he has so fully proved in the preceding disfusion of this subject, that Aberhadon had two successors at Nineveh, Saofuchinus and Chyniladon; or, with his assertion, that Sarae, the last Assyrian king, was the successor of Chyniladon?

Blair, in his Chronological Tables, rates the commence- ment of the reign of Phut, in the year 777 B. C.; the
ASS

feudalism of Tigrath-pilefer, in the first year of Nabonassar, or 747 B.C.; that of Sennacherib, in 727 B.C.; that of Assurbanus, in 685 B.C.; that of Sennacherib in 612 B.C.; that of Assurbanus in 667 B.C. The writing of these nations, that their letters had a great affinity with each other. They much resembled one another in shape; and they ranged them in the same manner, from right to left. Playfair's Chronology, p. 67—70. Newton's Chron., ch. ii., and Opera. by Horsey, t. v. p. 191—211. Anc. Un. Hist., vol. iii. p. 327—327; Gugliel. Olyg. of Laws, &c., vol. i. p. 41.

ASSYRIAN LETTERS, Letters Assur, a denomination given by several Rabbinists and Talmudists to the characters of the present Hebrew alphabet, as supposing them to have been borrowed from the Assyrians during the Jewish captivity in Babylon. Montfaucon.

AST, now Asia, in Ancient Geography, a town of Liguria, or Piedmont, which was a Roman colony, upon a river of the same name, not far from the Tamaris. The fortifications of this place afforded a temporary shelter to the emperor Honorius, when he was pursued by the Goths, A.D. 403; and he was relieved from the danger of a successful siege, and the indignity of a capitulation to the Barbarians, by the forcible establishment of Stilicho, who cut his way through the Gothic camp under the walls of Asia, and thus revived the hopes and vindicated the honour of Rome. See Ast.—Asia, a town of Spain, in Bética, south of Nebrilla, upon the left arm of the Bética, which discharged itself into the bay of Gades.

AST, in Geography, a town of the united Netherlands, in the duchy of Gueldersland, four miles south-east of Oudenburg.—Asia, a river of Spain, which empties itself into the bay of Bizcay, at Villa Vicenta.

ASTABAT, a town of Armenia, thirty-three leagues south-east of Erivan.

ASTABENI, in Ancient Geography, a people of Asia, in Armenia. Ptolemy.

ASTABORAS, a river of Assyria, forming, as Pliny has said, the left channel of the Tigris; or as the Greeks have called it, the island or peninsula of Meroe; as Altipus forms the right channel. Altaboras, is the name given by the natives to the Tacazze, or the Sisris of the ancients. It joins the Nile in N. lat. 17° 31'. See Albra, Merot, and Tacazze.

ASTACAMPRON, a promontory of Asia, in the Indian sea, to the left of the gulf of Baraza. Arrian.

ASTACANA, a town of Asia, in Bactria, called Aflacca by Ammianus Marcellinus. Ptolemy.

ASTACANA, a name given by Rome to the Assacani.

ASTACAPRA, a town of India, on this side of the Ganges, situated between the mouths of the Indus. Ptolemy.

ASTACENA, a country of Asia, in Pontus, which took its name from the river Atlasses which traversed it.

ASTACENUM, Asturium, Marjonna, a gulf of Spain in Bética. Ptolemy.

ASTACENUS Sinus, a gulf of the Propontis, on which was situated the town of Nicomedia.

ASTACHAR, in Geography, formerly Aflacca, a town of Persia, near Bunehir and the ruins of Peripolis. It is now a village, although having a caravanserai, mosques, and the ruins of a palace.

ASTACILICIS, a town of Africa, in Mauritania. Ptolemy.

ASTACILIS, Tesseria, a place of the interior country of Africa, in Mauritania Cæsariensis, which was a Roman station, situated in the mountains south of Portus Magnus. Ptolemy.

ASTACUS, in Entomology, a species of Cancer, with a smooth thorax; proboscis toothed along the sides; and a single tooth on each side at the base. This is the common crawfish, that inhabits rivers, and lodges itself in holes.
AST

which it forms in the banks. Very frequent in many countries of Europe.

Astacus is also the name of a genus in the Fabrician system, formed of those species of the Limnian Curasi, that have four pedunculate antennae, the two fore-ones of which are long and falcate, and the posterior ones cleft. Among these the lobster and craw-fish are included.

Astacus, in Ancient Geography, a town of Asia, in Bithynia, situate upon the Astacene gulf, according to Strabo. The city was built by the Megarians and Athenians, and destroyed by Lycurgus, and its inhabitants transported to Nicomedia, by whom it was founded or re-established. Some have said that Nicomedia was built on the ruins of Astacus. — Also, a town of Greece, in Arcadia.

AST, a people of Europe, in Thrace. Steph. Byz.

ASTAFORT, in Geography, a town of France, in the department of the Lot and Garonne, and chief place of a canton in the district of Agen. The place contains 4159, and the canton 12,151 inhabitants; the territory comprehends 1324 kilometers and 31 communes.

ASTAGENI, in Ancient Geography, a people of Arabia Felix. Ptolemy.

ASTAGON, in Geography, a town of Africa, in Morocco, on the confines of Zanguebar.

ASTAMAR, ACTAMAR, or ABAUNAS, a large lake, with a fortified town of the same name, in Armenia. N. lat. 36° 30', E. long. 44° 14'.

ASTAN, a river of Arabia, in Labia, which is probably the stream in Neged mentioned by D'Anville, and is represented by Niebuhr as only a wall or brook which runs after rains.

ASTANDA, called also Astalin, in Antiquity, a royal courier, or messenger, the same with Angaros.

King Darius of Persia is said by Plutarch, in his book on the fortune of Alexander, to have formerly been an astanda.

ASTANDAS, in Ancient Geography, a town of Asia, in Armenia. Ptolemy.

ASTAPA, ESTEPA LA VIEJIA, a town of Spain, in Bética, south-west of Singili. It is distinguished by the records of its vigorous defence against Marins and the Romans, in the year of Rome 526. When they were no longer able to repel the besiegers, they kindled a fire, into which they threw all their effects, and rushed with their women and children into the midst of their enemies, by whom they were vanquished and slain; but no trophy of victory remained for their conquerors.

ASTAPELI, a people of Africa, placed by Steph. Byz. in Libya.

ASTAPUS, a river of Abyssinia, which with the Astaboras formed the peninsula of Meroe. This river, known now by the name of the "White River," is represented by Diodorus Siculus as proceeding from large lakes to the southward, and having thrown itself into the Nile, makes with it the right hand channel including Meroe in Atbara. See Astaboras and Meroe.

ASTARA, in Geography, a town of Persia, in Ghilan, on the Caspian Sea.

ASTARABAT, a town of Persia, in Segelban, 100 miles north of Caresan, and 220 W.N.W. of Candahar.

ASTARAC, a small territory of France, situate in the late province of Agen, about eight leagues square, of which the capital is Mirande.

ASTAROTH, in Ancient Geography, a town of Palestine in Bataan, or Bathan. This was a strong city belonging to the half tribe of Manasseh, on the other side of Jordan. It was granted to the Levites of the family of Gad, according to Joshua.

ASTAROTH-CARNAM, another town of Palestine, south-west of the former, and distant from it nine miles, between Adraa and Abila. It is supposed to have derived its name from Ailarte, called Ailtaroth, the deity of the Phoenicians, and Carnam, signifying horns or a crecent, with which he was represented.

ASTAROTH, in Mythology, an idol of the Philistines, which the Jews destroyed at the command of Samuel. It was also the name of a deity of the Sidonians, which was worshipped by Solomon in his idolatrous days. See Astaroth.

ASTARTE, a deity of the Assyrians, under which appellation they worshipped the moon, and from them that species of idoltry extended to the Phoenicians, Carthaginians, and other ancient nations. Adonis, who was an Assyrian by descent, is said to have married Astarte; and after their death they were elevated to the rank of gods; and as it was the opinion of ancient times, that the souls of distinguished personages after their death inhabited the stars, it has been imagined that those of Adonis and Astarte made choice of the sun and moon for their respective residences; and hence their worship and that of those luminaries was the same. Astarte was called in Hebrew Astaroth or Astaboras, and which appellation some have erroneously attributed to her having been represented in the form of a sheep. Others have conjectured, from the etymology of the word Astaroth, which signifies "flocks of sheep or goats," that in ancient times, when men were chiefly addicted to pastoral life, and peculiarly delighted in this occupation, the most approved flocks of excellence and beauty were deduced from hence; and this has been supposed to have been the reason of the name Astartoth or Astarte. Astarte was usually represented, like Isis, with cow's horns on her head, and for the same reason, namely, for exhibiting the moon's increase and decrease; as she was consecrated into that planet, and adored under the denomination of the "queen of heaven." Her principal worship was established at Hieropolis in Syria, where she had a magnificent temple, and more than 300 priests employed at her altars.

Cicero, and also Claudius, suppose that the Astarte of the Phoenicians was one of the four Venuses, whom the Roman orator enumerates. Beger and Bochart add, that she was Venus armed, or the goddesses of war; and Paulus Niger, on whose authority they rely, says, that the Cythereans, who adored her under this form and appellation, had received this worship from the Phoenicians. Astarte, according to Lucian, was the moon; and Juno among the Carthaginians, according to St. Augustin, who, as Bochart imagines, had derived their opinion from Horace, i. ii. od. 1. and Virgil, Æne. i. 15. This goddess was represented by her votaries in different nations, under a variety of forms and attributes. The Sidonians represented her under the figure of a hen who covered her chickens with her wings. The Astarte, mentioned by Cicero, was exhibited in Phoenicia with a quiver and arrows. In her temple on mount Libanus, where she was mourning her lost Adonis, her head was veiled, and rested on her left hand, and floods of tears streamed down her cheeks. Among the Assyrians, she was sometimes termed a goddess, and sometimes a god, on account of the ambiguity of gender in the Oriental languages, and because the Hebrews knew no distinction of sex in the gods. The mythological writers, in general, have thought that Astarte is, under different names, the Venus or Mylitta of the Assyrians, the Mithra of the Persians, the Isis of the Egyptians, the Io and Venus Urania of the Greeks, the great goddess of the Syrians, the Derceto of Acalon, and probably Diana, &c. When the black conical stone, which
ASTASANA, in Ancient Geography, a town of Asia, in Arabia, Provincia.

ASTATTI, in Ecclesiastical History, the followers of one Sergius, in the ninth century, who renewed the errors of the Manichæans.

The word is derived from the primitive A and arecifria, to bland, and signifies anything obdurate and inconstant. They prevailed much under the emperor Nicophorus; but his successor, Michael Cypriotes, curbed them with very severe laws.

ASTCHIKOUNIPI, in Geography, a large lake in New Britain, abounding with whales, and fupposed to communicate with the Northern seas.

ASTEISM, in Rhetorium, a genteel way of irony, or hard-some way of deriding another. Such is that of Virgil:

"QUERY! BAVIUM non odit, amet tue carmina Mavi?"

ASTEIXIS, in Ancient Geography, a mountain of Africa, part of mount Atlas, to the south of Mauritania Caerifaniis.

ASTELEBE, a town of Asia Minor, in Lydia. Steph. Byz.

ASTELEPHUS, a river of Cæcilia, which ran into the Euxine sea. Arrian.

ASTELL, Mary, in Biography, the daughter of a merchant at Newcle-apon-Tyne, was born in the year 1688, and instructed by her uncle, who was a clergyman, in logic, mathematics, and philosophy, as well as in the Latin and French languages. At twenty years of age she removed to London, and devoted the principal part of her time to study. In order to excite emulation, and a desire of improvement among her sex, she published "A Serious Proposal to the Ladies, wherein a method is offered for the improvement of their minds," printed in 12mo. at London in 1697. Her proposal, which was the establishment of a seminary for female education, excited so much attention, that a lady, supposed to be the queen, formed a design of giving 1000l. towards erecting a kind of college for the education of the female sex, and as an asylum to such ladies as might wish to retire from the world; but bishop Burnet discouraged the liberal intention, by alleging, that such an institution would too much resemble a nunnery. Mrs. Athell's "Reflections on Marriage," written in consequence of a matrimonial disappointment, were published in 1703. Mrs. Athell was orthodox in her religious creed, and in her politics an advocate for the doctrine of non-resistance. Besides some controversial pieces, such as "Moderation truly rated," "A Fair Way with the Defenders," "An Impartial Inquiry into the Causes of the Rebellion," and "A Vindication of the Royal Martyrs," all printed in 1704; she also distinguished herself by a more elaborate performance, published in 1705, and intituled, "The Christian Religion as professed by a Daughter of the Church of England," in which she laid the refutation to attack Locke and Tillotson. The close of her life was embittered by the anguish of a cancer in her breast, and she bore amputation with fortitude. She died in the year 1731. Her manners were austere, and her principles rigid; and though she attracted notice at the time in which she lived, neither her natural talents, nor literary attainments, would command attention among the females of the present day. Grudging the waste of time occasioned by trifling visitors, and yet ferocious of dictating falsehoods to her servants; according to the refinement of modern practice; she used to accost such intruders on their approach; and jetingly say to them, "Mrs. Athell is not at home." Bellard's Mem. of British Ladies. Biog. Brit.

ASTELES, in Ancient Geography, a town of Spain, in Bética, Sivâba.

ASTELEONORUS, in Entomology, a species of Papilio (Ep. Athelis) that inhabits the Cape of Good Hope. The wings are black, both above and beneath; a radiated white spot on the anterior pair: disk of the posterior ones yellow. Fabricius. This is *papilio oponente* Cramer; and *papilio minor* of the same author, is supposed to be a variety (5) of this species.

Species 1. A. taxifolius, yeâ-leaved flâr-wort. "Under-shrubby; leaves decurrent, fimbriate, ciliate, ciliate; flowers terminal." Stem scarce a foot high; leaves alternate, crowded, linear, revolute; flowers foliaceous, or subpandunculated, foliaceous. 2. A. reflexus, reflected flâr-wort. Shrubby; leaves ovate, subimbricate, recurved, serrate, ciliate; flowers terminal. Stem prolificous; leaves crowded, fimbriate, little, smooth, round, or one serrate, upper ciliate; flowers foliaceous, fimbriate, ray blood-red. 3. A. montanus. Shrubby; leaves ovate-oblong, acute, tomentose underneath; calysse terminated in a hair. Branches with few divisions; leaves fimbriate, exquisitely pointed, rough about the edges; peduncles terminal, leafy, one-flowered; ray of the flower blue. 4. A. fruticosus, shrubby flâr-wort. Shrubby; leaves linear, dotted; peduncles one-flowered, naked. Stems three feet high; branches woody, furnished with clusters of narrow leaves like those of the larch tree; flowers foliaceous, upon long slender peduncles; they are of a pale blue colour, and appear in March. Leaves narrow, acute, approximating. Cultivated in 1759 by Mr. Miller. This and the preceding species grow wild at the Cape of Good Hope.

**His**
**Herbaceous, entire-leaved, peduncles scaly.**

5. A. *tenellus*, bristly-leaved star-wort, Curt. Bot. Mag. 53. "Leaves filiform, prickly-ciliate; calyxes hemispherical, with equal leaflets." Stem annual, seven inches high; leaves scattered, linear, mucrinated underneath; flowers peduncled, solitary, terminal; disk of the corolla yellow, ray blue, often rolled back. A native of the Cape. Introduced here by Maffon in 1774. 6. A. *alpinus*, great blue mountain star-wort, Curt. Mag. 199. "Leaves sublirapatate, rough with hairs, entire; stems simple, one-flowered." With or without to near a foot in height; at the top of each stalk is one large blue flower; stem-leaves two, seldom three, which are ovate, ciliate, petiolate next the root, on the stem slender, lanceolate. It flowers in June. A native of the Alps and Pyrenees. Cultivated by Miller in 1753.

**Herbaceous, entire-leaved, peduncles scaly.**

11. A. *hybrifolius*, hybrif-leafed star-wort. "Leaves linear-lanceolate, drawn to a point at the base, entire, fliff; branches corymbed, fathigitate; leaflets frequently linear, imbricate; calyxes cylindrically ciliate, densely imbricate." Stem a foot high, eight purple florets in the ray; disk elevated, greenish, flammif ciliate, pilary yellow. A native of America. Cultivated in 1762 by Miller. 12. A. *dumosus*, bushy-star-wort. "Leaves linear, entire, smooth, those on the branches very short; branches panicled; calyxes cylindrically, closely imbricate." Stem two feet high, much branched; branches filiform; stem-leaves narrow-lanceolate, on the branches linear; flowers small, very white, disk yellow. Cultivated in Chelsea garden in 1725. 13. A. *cri- coides*, heath-leaved star-wort. "Leaves linear, entire, very smooth, those of the branches subulate, approximating; those of the stem elongated; calyxes subfibrasso; leaflets acute, stem smooth." Stems slender, three feet high; branches numerous, forming a thick bush, and terminated by fingle flowers. Cultivated by Miller in 1758. 14. A. *tenifolius*, fine-leaved star-wort. "Leaves sublineal, quite entire; petiole, fmall leaf." Stem five feet high, slender, angular, smooth, with few branches; leaves alternate, rough; flowers terminal, solitary, small, white; peduncles with small fulicate leaflets scattered over them. 15. A. *linariosus*, favor-leaved star-wort. "Leaves linear, entire, mucronate, scabrous, fliff, upper ones lax, remote; calyxes imbricate; branches fathigitate." Stems purplish; leaves very rough, sharp, keeled, scattered; peduncles alternate; flowers few, terminal, solitary. Cultivated here in 1712. 16. A. *linifolius*, fliff-leaved star-wort. "Leaves linear, entire, rough; branches corymbed, fathigitate, with small leaflets; calyxes imbricate; rays about equal to the disk." Leaves lanceolate, gradually narrowing to the end; peduncles with many small fulicate leaves; stems four, from two to three feet high, with many branches, terminated by one blue flower. Cultivated in 1739 by Miller. These species are natives of North America. 17. A. *acris*, "Leaves lanceolate-linear, fliff, entire, flat; flowers corymbed fathigitate; peduncles leafy." Much branched; leaves very narrow; flowers of a pale blue colour, in large clusters at the top of the plant. A native of the south of Europe. 18. A. *concolor*. "Leaves ovate, fomewhat, quite entire; stem simple; raceme terminal." Four feet high; flowers of a pale blue colour; the whole plant tomentose; raceme simple, with very short peduncules. A native of America. 19. A. *vigorus*, fliff-leaved star-wort. "Leaves linear, alternate; flowers terminal, solitary." Leaves small, fliff, many; stem woody, almoft simple, terminated by one fpecious flower; fiofules of the ray purple, long. A native of America. 20. A. *novi angliae*, New England star-wort. "Leaves lanceolate, entire, cororate, stem-clasping, hairy; calyxes longer than the disk, loofe; leaflets linear-lanceolate, nearly equal; stem hispid." Stems many, five feet high, brown, terminated by large purple violet flowers, growing in a loose panicle, and appear in August; peduncles very short. A native of New England and Virginia. Cultivated in 1731 by Miller. There is a variety with numerous panicled branches. 21. A. *undulatus*, waved star-wort. "Leaves ferrate, hairy waved, lower corotate; petioles winged, dilated at the base; branchlets virgate; calyxes imbricate; stem hispid." Stems two or three feet high; leaves broad, heart-shaped at bottom; flowers on loose spikes, of a pale blue colour, inclining to white; leaves on the peduncles minute, ovate. A native of North America. Cultivated in 1699, by J. Bot- bart. 22. A. *grandiflorus*, Cateby's star-wort, Mill. fig. t. 282. "Leaves stem-clasping, linear, entire, hispid, ciliate; those of the branches and calyx reflex." Stems many, three or four feet high, fliff, reddish, hairy; leaves of the branches small, lanceolate, rough, about the line of those on common hyflor; branches each terminated by one large blue flower. Mr. Cateby, in 1729, brought this plant from Virginia.

**Herbaceous, leaves ferrate, peduncles smooth.**

obtuse; stem almost naked; filiform, a little branching; peduncles naked. Stem green, hairy, erect; leaves like those of daisy; foliaceous, slender, white. A native of Virginia.

Herbaeae, leaves ferrate, peduncles feathery.

27. A. indicus, Indian starwort. "Leaves ovate-oblong, ferrate; floral leaves oval-lanceolate, quite entire; branchlets one-flowered." Stem herbaeaceous, round, fluted, branched, two feet high; lower leaves oblong, remotely and acutely ferrate; upper lanceolate, entire, gradually diminishing towards the top; flowers solitary. A native of Japan and China. 28. A. leiophyllum, smooth after. "Leaves ferrate, entire, shining; root-leaves subferrate; branchlets simple, bearing about one flower; calyxes imbricate, peduncles leafy, subdivided; leaflets somewhat wedge-shaped; acute, thickened at the end; stem smooth." Ray blue. A native of North America. Cultivated in 1758 by Miller. 29. A. mutabilis, variable starwort. "Leaves almost ferrate-clasping, lanceolate, ferrate, glossy, drawn to a point below; branchlets virgate; calyxes rather leafy, lax; stem smooth." Leaves of the peduncles and calyx squarrose and recurved; ray a deep purple; disk dark yellow, afterwards purple. Cultivated by Miller in 1731. 30. A. Tradescanti, Tradescant's starwort. "Leaves lanceolate, ferrate, filiform, smooth; middle branches virgate; calyxes closely imbricate; stem round, smooth." Radical leaves four inches long, like those of willow; stems round, smooth, woody, brownish; ray varies from white to purple, confining of twenty florets. A native of Virginia. Cultivated in 1731 by Miller. There are two varieties, viz. the dwarf and tall starwort. 31. A. sericeus, New Holland starwort. "Leaves almost fern-clasping, lanceolate, smooth, but feathery about the edge, the lower ferrate; branchlets subdivided; calyxes usually imbricate, leaflets linear-lanceolate; stem round, smooth." Stem four feet high, having broad leaves at the bottom, diminishing gradually to the top; disk of the corolla yellow; ray pale blue, revolute. It is very like A. mutabilis. Its flowers appear in the latter end of August. A native of N. America. Cultivated in 1759 by Miller. 32. A. viridissimus, late-flowering starwort. "Leaves feathery, lanceolate, drawn to a point at the base, ferrate, smooth; calyxes lax, leaflets lanceolate-linear, subacute, smooth." Stems two feet high, scarcely branching, smooth; leaves large, smooth, rather fluff, ferrate at the middle, and having a perfect feathery; flowers like those of the foregoing. It differs from the 31st in having the branches more divaricate, and a knot or joint at the base. A native of N. America, introduced here in 1775 by Mr. Cree. 33. A. microphyllus, small white-flowered starwort. "Leaves feathery, lanceolate, subferrate, smooth; calyxes imbricate, leaflets acute; disk equal to the rays." Stem a foot and a half high, thick, green, less panicle than the rest; stem leaves a little ferrate, nodding, thothe of the branches lanceolate; ray white, very small, poor, disk small, convex, pale, with dark yellow styles. A native of N. America. Introduced here in 1776 by Mon. Thouin. 34. A. macrophylus, broad-leaved blue starwort. "Leaves ferrate, oblong; the upper ovate, feathery, than the stem cordate, petiolate; upper petioles winged." Peduncles crowded at the top, often trifid. A native of N. America. Cultivated in 1739 by Miller. 35. A. Chinensis, China after or starwort. "Leaves ovate, angular toothed, petiolate; calyxes expanding, leafy, terminal." Height from eighteen to twenty feet, putting out long bending branches from top to bottom; leaves next the ground, and at the origin of the branch resemble those of common goosefoot (Chenopodium), those on the branches are much smaller, and the upper ones narrow and very entire. The flowers are largest and handdest of any of this genus. Disk yellow, disciform of the ray broad and long. Dillenius and Miller affirm, that this species came originally to Europe from China; Linnæus doubts of this. Besides the common varieties, white, blue, purple, and red, both single and double, there is now another in the gardens with variegated blue and white flowers. 36. A. tataricus, Tatarian starwort. "Root leaves lanceolate-oblate, ferrate, februous; stem few-flowered." Radial leaves large, running into petioles; stem rough, scarcely twice as long as the radical leaves; flowers large, five or eight in number; the peduncle has two alternate flender entire branches; ray of the corolla blue. A native of Siberia. 37. A. bipinnatus, starwort. "Leaves oblong, crenate, ferbruous, leaflets clafping, stem ferrate." Stem erect, bipinnat, a foot high; lower leaves obtuse, remotely notched; flowers terminal, solitary; ray white; dawn ferrugineus. 38. A. filifera, ragged starwort. "Leaves oblong, ferrate, februous, peduncles paniculat." Stem herbaeaceous, a foot high, at top branched in panicles; leaves alternate, petiolate, pointed, above green, rough, with white ciliis, underneath pale, veined, smooth; flowers in terminal panicled branchlets. Both the above are natives of Japan.

Species excised by Mr. Miller, &c.

39. A. globulus, peach-leaved starwort. "Leaves oblong-lanceolate, acute, ferrate, stem branching, flowers terminal, calyxes linear, erect." Five feet high, bearing large, pale blue flowers. A native of N. America. 40. A. sericeus, late-flowering blue starwort, or Michaelmas day. "Leaves oblong, acute, broader at the base, half stem clasing, stem branching, flowers terminal, for the most part solitary." Stems numerous, three feet high; branches lateral, bearing large pale blue flowers. Brought from Virginia by Tradescant. 41. A. paniculatus, early starwort. "Leaves oblong, acute, februous, sharply toothed, half stem clasing, stem hairy, flowers corymbous, calyxes hairy, erect." Stems a foot and a half high; flowers large, blue, expanding in July. A native of the Alps and Pyrenees. 42. A. alitifolius, lofty starwort. See panicus (2) n. 24. 43. A. ranunculifolius, branching starwort. "Leaves linear-lanceolate, short; stem very branching, spreading; flowers placed regularly one above another; peduncles leafy." Stems slender, purplish, about three feet high; branches numerous, spreading; flowers small, pale purple, appearing in November. A native of N. America. 44. A. umbellatus, umbellate starwort. "Leaves lanceolate, drawn to a point at the base, entire, februous about the edge, branches corymbous, fucidate." Stems several feet high, channelled; ray of the flower white. A native of N. America, flowering in July and August. Cultivated by Miller in 1759. 45. A. nerovolius, three-nerved starwort. "Leaves linear-lanceolate, acute, nerved; stem simple, flowers terminal in a kind of umbel." This much resembles the umbellatus, but the leaves are narrower, whiter on the under side, and have three longitudinal veins. The flowers are also larger and whiter. Sent from Pennsylvania to P. Colliton, eqq. who gave it to Miller. 46. A. paniculatus, panicked starwort. "Lower leaves ovate, half stem clasing at the base; upper leaves lanceolate, small; stem panicked, branches one-flowered, peduncles leafy." About four feet high; branches erect, forming a leaf spike of large blue flowers. A native of N. America. 47. A. lunifolius, "Leaves linear-lanceolate, fuchis, the same, flowers corymbous, terminal." Stems a foot and a half high, terminated by peduncles on every side, each emitting one pale blue flower. A native of Canada.

48. A. procumbens, procumbent starwort. Mill. fig. 1. 57.
4. "Leaves ovate, toothed; stem procumbent; peduncles naked, axillary, one-flowered." Stems round, inclining to the ground, about four or five inches long, deltate of leaves, each supporting one flower of the shape and size of the common daisy, of a whitish purplish colour. Discovered by D. Houtrot, about Vera Cruz in America. Perhaps some of these may not be distinct from the foregoing ones, as there are certainly many species recited by authors which have not yet taken their proper place in the system, and require a very judicious botanist to arrange them. In Gordon's Catalogue we find the following names not noticed by Linnæus: 1. A. alienatus, virgatus, fiddle. 1732. 2. A. ferrate, lax as 1732. pens, corymblata. 3. A. smallis, leaves oblong-lanceolate, ferrate, underneath fibrous; leaves one-flowered, leafy." A native of New Zealand. 50. A. varius, Forti. "Herbaceous, leaves ovate, quite entire, furrowed above, woolly underneath, stipes one-flowered, leafy, woolly." A native of New Zealand.

Species of Aster from Aiton's Hort. Kev. 51. A. cambrica, cambrica-leaved flowered. "Slubby, leaves ovate, minute, rough, with hairs, calyces inaricate, hairy." Found at the Cape, by Mafon. Introduced here in 1786. It flowers most of the year. 52. A. nemoralis, wood flowered. "Leaves linear-lanceolate, drawn to a point at the base, somewhat februous; branches filiform, one-flowered; calyces lax imbricate, leaflets acute." A foot high, ray of the corolla blue, disk white. It flowers in August. A native of Nova Scotia. Introduced in 1778, by W. Malcolm. 53. A. polyanthus, marth flowered. "Leaves linear, stem clasping, entire, smooth, februous at the edge; peduncles allfilmed, calyces squarrose." Leaves three or four inches long, remote, ray blue, large, disk yellow. A native of the swamp of Carolina. Introduced by Mr. Fairbairn in 1784. It puts out flowers in September and October. 54. A. paluster, spreading, hairy-stalked, flowered. "Leaves oblong, entire, acute, cordate, allfilmed-clasping, februous, branches spreading, elongated, few-flowered, calyces imbricate, subfuscous, stem rough with hairs." Three feet high; branches remote, pubescent; leaves bent obliquely at the base; ray pale blue, disk tawny. A native of Virginia, flowering in September. Introduced about 1773, by G. Audren, efq. 55. A. foliosa, leafy flowered. "Leaves lanceolate-linear, entire, smooth; the base of the branches spreading very much; calyces imbricate, leaflets acute, stem pubescent." A native of North America. Cultivated by Dr. Sherard in 1732. It flowers in September. 56. A. multiflorus, pill-head flowered. "Leaves linear, entire, smooth; branches one-ranked; calyces imbricate, squarrose; leaves somewhat leathery, acute; stem pubescent." Stems unequal to support the abundance of the leaves, leaves rough, the veins form rhomboids; scales of the calyx minute, reflex; flowering branches and peduncles covered with leafy scales; ray white, small. A native of North America. Cultivated by Dr. Sherard in 1732. F. October. "There is an early and a late flowering variety of this species. 57. A. folliculatus, willow-leaved flowered. "Leaves linear-lanceolate, quite entire, smooth; calyces imbricate, lax; stem glossy. Stem five or six feet high, leaflets of the calyx acute, expanding at the end; ray of a bluish fleth-colour." A native of North America. Cultivated in 1760, by Miller. 58. A. affinis, Labrador flowered. "Leaves lanceolate, subdubium-clasping, quite entire, smooth, februous about the edge; calyces lax, leaflets equal. Stem two feet high, hispid, ray blue." A native of North America. Introduced here in 1776, by Meff. Gordon & Co. F. in July and August. 59. A. franciscus, flender-stalked flowered. "Leaves lanceolate-linear, felise, smooth, the lowest sublanceolate, those of the branches lanceolate; branches virgate, calyces imbricate; stem smoothish. Potted for feet high, leaflets of the calyx acute, spreading at the end; ray fleshy, blue, flih-coloured; disk elevated, pale yellow. A native of North America. Cultivated in 1758, by Miller. F. in October. 60. A. pendula, pendulous flowered. "Leaves elliptic-lanceolate, ferrate, smooth, those of the branches rather remote; branches very much divaricated, pendulous; stem pubescent." Ray of the flower white; disk yellow, changing to fershine. A native of North America. Cultivated in 1758 by Miller. F. October. 61. A. diffusa, diffuse flowered. "Leaves elliptic-lanceolate, ferrate, smooth, proportioned; branches spreading; calyces imbricate; stem pubescent." Ray white. A native of North America. Introduced by Mr. Kennedy and Lee in 1777, F. September. There is a red and white-flowered variety. 62. A. divaricatus, spreading downy-stalked flowered. "Leaves elliptic-lanceolate, ferrate, smooth; those on the stem linear-lanceolate, elongated; branches spreading; calyces imbricate; stem pubescent." Above five feet high, weak; calyx cylindrical, with numerous acute leaflets; ray white; shorter than the calyx, disk reddish. A native of North America. Cultivated in 1758 by Miller. F. October. 63. A. corystis, corystis flowered. "Leaves cordate, smooth, acuminate, all fleshy ferrate; petals simple; branches fasiculate; stem smooth." A native of North America. Cultivated in 1765, by P. Collinson, efq. F. September. 64. A. pectabilis, showy flowered. "Leaves lanceolate, somewhat februous; the lower ferrate; branches corystis; calyces leafy, nearly wedge-shaped, sharpilis, squarrose." Two feet high; ray blue. A native of North America. Introduced in 1777, by Dr. Picezim. F. August and September. 65. A. radula, rough flowered. "Leaves lanceolate, ferrate, acuminate, wrinkled, very februous; calyces imbricate; leaflets lanceolate, obtuse." A native of Nova Scotia. Introduced in 1785 by Dr. Picezim. F. September. Propagation and Culture. The species from the Cape N. 1-5, and No. 51, together with No. 27, 37, and 38, not producing seeds in England, are propagated by cuttings any time during the summer. These should be planted in small pots filled with light earth, and plunged into an old hot-bed; where, if they are shaded from the sun, and gently watered, they will put out roots in six weeks, when they may be placed in the open air; and in about a month afterwards they should be separated, each in a small pot, and filled with light sandy earth. In October they must be removed into the green-house, and placed where they may enjoy as much free air as possible; but be secured from fruits or saps; so that they are much easier preferred in a glasshouse, where they will have more light and air than in a green-house: but they must not be placed in a stove, for artificial heat will soon destroy the plants. The North American species, which make at least three-fifths of the genus, together with the Alpine and Italian alpines, are easily propagated by parting the roots in autumn; they are most of them hardy, and will thrive in almost any soil and situation; for these reasons, and because they adorn the latter season with the abundance and variety of their fleece flowers, they are valuable plants, especially among shrubs, and in large ornamental plantations, properly mixed with golden rods, and other perennial, annual, hardy plants. The roots most cultivated, are the gratifolium, heliolion, hiairfolium, tenfolium, ericoides, dumosus, froe- tinus, alpinus, nova anglica, and panicus or alliifolius. Some of the species (No. 6. 41. 42.) prefer a sandy situation and moist soil. They are apt to spread very much at the
the roots, so as to be troublesome, and the seeds of some are blown about and come up like weeds. The Italian star-wort (9) has not been so much cultivated in England since the great variety of American species has been introduced, though it is by no means inferior to the best of them. It is propagated by parting the roots soon after the plant is out of flower. The roots should not be removed earlier than every third year. Catesby’s star-wort (22) not multiplying fast by its roots, may be propagated in plenty by cuttings from the young shoots in May, which, if planted in light earth and shaded from the sun, will flower the same year. When the annual star-wort (25) is once introduced, the seeds will scatter, and the plants come up without care. The China star (35) being an annual plant, is propagated by seeds, which must be sown in the spring on a warm border, or rather upon a gentle hot-bed, just to bring up the plants; for they should be transplanted to the open air as soon as possible; when the plants are three inches high, they should be taken up and planted in a bed of rich earth, at six inches distance every way, observing to shade them from the sun till they have taken new root; and if the season is dry, they must be often refreshed with water. In this bed they may remain a month or five weeks, by which time they will be strong enough to transplant into the borders of the flower garden, where they are designed to remain; or into pots to adorn court-yards, &c. The plants should be taken up carefully with large balls of earth at their roots; after they are planted, and the earth closed about their roots, there should be some water given them to settle the earth. If the ground be rich, these plants will flower in August, and form the greatest ornament in the flower garden in autumn. They ripen in the beginning of October, and should be gathered when they are perfectly dry. Procumbent star-wort (48) being a native of a warm climate, will not live in the open air in England. The seeds must be sown in a hot-bed; and the plants will require a stove to preserve them during the winter. See Martyn’s Miller’s Diet.

ASTER. See *Arctotis*, *Arnica*, *Buphthalmum*, *Carpeianum*, *Chrysanthenum*, *Chrysocoma*, *Cineraria*, *Conyza*, *Erigeron*, *Gorteria*, *Isula*, *Snecio*, *Solidago*, *Tussilago*.

ASTER, in *Mineralogy*, a denomination given to a species of Samian earth.

ASTER, in *Natural History*, a species of *Hydra* in Gmelin’s Syll. Nat. This is the *adiemia aster* of Ellis, and inhabits the American seas. The item is thick, fleshy, subcylindrical, smooth, truncate, and radiated, with tentacula.

ASTER is also a denomination, in the *Ancient Pharmacy*, given to a kind of medicine, invented by Andromachus, against deliriums, and divers other pains.

ASTERIA is the name of a gom, usually called the cat’s eye, or *oculus euti*. It has only two colours, a pale brown and a white, the brown being the ground, and the white shining about it, as the fire colour in the opal. It is considerably hard, and will take a fine polish, but is usually worn with its native shape and smoothness.

It is found in the East and West Indies, and in Europe. The islands of Bermuda are full of very fine ones, but they are very small; they are very common in the sands of rivers of New Spain; and in Bohemia they are not unfrequently found in the same mists of Jasper with the Opal.

ASTERIA is also the name of a figured stone. See Starstone.

ASTERIA, in *Ancient Geography*, a small island between those of Ithaca and Cephalonia. Strabo. This is called Asteria by Homer in the Odyssey.

Vol. III.
Asterius, a writer of the Arian sect, in the reign of Constantius, or about the beginning of the fourth century, was a sophist of Cappadocia, and denouncing Gentilism, he embraced Chriftianity. About the year 304, during the persecution of Maximian, his virtuous resolution failed him, and he offered sacrifices to the Pagan deities, which prevented his attaining the honour of being a bishop, to which he aspired. But though he was recovered by Lucian, he was attached to Arius; and whenever he is mentioned by Athanasius, he is called a cunning sophist, and a patron of heresy. Philologus, however, represents him as a moderate Arian, having taught, that the Son was in subservience like the Father, and a complete likeness of the Father. According to Jerome, he wrote commentaries upon the epistle to the Romans, upon the Psalms, and upon the Psalms, and many other things, "which were much read," he says, "by the men of his party." Some passages of his writings are cited by Athanasius and Eusebius, in which, says Lardner, "there appear an air of piety, and zeal for the Christian religion." Cave H. L. i. p. 201.

A-Stern, denotes any distance behind a ship; as opposed to A-Head.

Asteroccephalus, in Botany. See Scabiosa.

Asteroids, formed of ares, star, and obus, form, and denoting that they resemble fixed stars, in Astronomy, a name given by Dr. Herchell to the new planets, or two celestial bodies, Ceres and Pallas, lately discovered; and which he defines as "celestial bodies, which move in orbits either of little or of considerable eccentricity round the sun, the plane of which may be inclined to the ecliptic in any angle whatsoever. This motion may be direct or retrograde; and they may or may not have considerable atmospheres, very small comas, limbs, or nuclei. According to the definitions which he premised, planets are celestial bodies of a considerable size and small eccentricity of orbit, moving in planes that do not deviate many degrees from that of the earth, in a direct course, and in orbits at considerable distances from each other, with atmospheres of considerable extent, but bearing hardly any sensible proportion to their diameters, and having satellites or moons; and comets are very small celestial bodies, moving in directions wholly undetermined and in very eccentric orbits, apparently parabolic orbits, situated in every variety of pole, and having very extensive atmospheres. Dr. Herchell having compared the newly discovered stars by the criteria introduced in the above definitions, maintains, that they differ so much respecting both planets and comets, as to warrant his not referring them to either of these two classes. Our astronomical readers will probably think the difference not sufficient to render this kind of distribution necessary; they will regret, that the author has contributed to introduce, without absolute necessity, a new term in the science of astronomy; and they will perhaps be of opinion, that the new name of "Asteroid," is not the most appropriate and expressive that could have been devised. An asteroid is a body resembling fixed stars; but the two new planets have no one circumstance in common with those distant bodies. If a new name must be found, let them be called by some appellation, which shall, in some degree, be descriptive of, or at least consistent with, their properties. "The invention of a name," says an anonymous writer, "is but a poor achievement in him who has discovered whole worlds." Phil. Trans. for 1802, Part II. p. 213, &c.

Asterope, in Mythology, one of the daughters of Atlas, the first of the principal stars that compose the Pleiades. Ov. Fast. iv. 170.

Asterophytton, in Natural History, the name given to a kind of star-fish, which is composed of a great number of cylindric rays, each branching out into several others, so as to represent the branched folks of a very inconstant furb.

Asteroplattycapos, in Botany. See Orthoa-

Asteropodium, in Natural History, the name given by authors to a kind of extraneous foliy, of an intricated texture, composed of a number of small convex, or concave plates, and serving, when entire, as a bale or root to the Asteria, or star-robe.

It is very plain, that this is the remains of some animal body, probably of the star-fish kind, to which the Asteria have also once belonged: but our imperfect knowledge in the animal history, has not yet ascertained us of the particular creature; the most probable conjecture is, that it is the Magellanic star-fish, the rays of which nicely and exactly represent some of the most perfect afterpodia.

Asteropterus, in Botany. See Inula, and Leysera.

Asterusia, in Ancient Geography, a mountain towards the sea, in the southern part of the isle of Crete.—Allo, a town situate upon mount Causicus, founded by a Cretan colony, according to Steph. Byz.

Asteres, or County of Asia, in Geography, a country of Piedmont, in Italy, bounded on the west by the principality of Chieri and Carmagnola, on the north by the Vercellais and the Alexandria, and on the south by the marquisate of Gorgoneo; about 25 miles long and ten broad.

Astellæa, of Asteria, in Ancient Geography, an island of Asia, on the coast of Godrosea. Ptol.ency.

Asthagura, a town of India, on this side of the Ganges. Ptol.ency.

Asthenia, in Medicine, a term employed to denote bodily debility. It is derived from a privative, and πσης, robus. In the system of Sauvages, and some other physiological writers it forms a distinct genus, being clathed with syncope, and other similar diseases; but it is commonly used by physicians in a more extended sense, so as to embrace all that vast variety of chronic complaints, in which there is a general languor of the body, from the vital functions and muscular actions out being performed with that degree of energy which is necessary to health. The general therapeutic treatment proper in cases of debility, consists in the employment of tonic medicines, such as the Peruvian barks, bitters, chalybeates, the cold bath, or temperate bath, sea-bathing, country air, a mild nourishing diet, riding on horseback, &c. It should be remarked, however, that this general tonic plan is not applicable, in its full extent, to all affilative diseases, some of them being complicated with visceral and other local obstructions and inflammations, which require peculiarities of treatment, as will be duly noticed in the couple of our observations under those several heads.

Asthma, a shortness of breath; from πσης or ἀσπης, a breath, I pant.

The disease which bears this name may be defined to be a short and laborious respiration, accompanied with a wheezing noise, generally coming on by fits, and going off by a cough, and spitting up of phlegm. It is not ulcerated in the larynx in Sauvages's system it is classed under anesthésions; in Cullen's, under spasms. The former enumerates no less than eighteen species thereof; the latter only three, viz. A. spontaneum, A. exanthematicum, and A. plectanum. Another writer has subdivided this disorder into four species. Some of
of these distinctions are unfounded, and most of them are of little or no surgical practice. By far the greater number of those cases of difficult respiration, which Sauvages has referred to asthma, belong to dyspepsia; a symptom common to various and opposite diseases, and distinguished from asthma by its manner of coming on, by its duration, and by the set of miasmid phenomena with which it is associated. Thus the flatsnifs of breath which occurs in pleunify, peripneumony, consumption, cataract, dropsy of the chest, &c. is only a concomitant of those diseases; but not the disease itself; and is therefore not asthma, but dyspepsia. The same may be laid of those cases which Floyer has enumerated as instances of continued asthmas.

There is likewise but one bipedal species of asthma; the periodic, or cancrif us asthma, the asthma (posthumum of Cullen; the dry or inflammatory asthma of others); the habituall asthma, as it is termed, being for the most part a variety thereof.

The periodic or convulsive asthma has been fully described by the celebrated Floyer, who himself laboured under this disease for the space of thirty years, that we shall chiefly take from him the history of its phenomena.

For some hours preceding a fit of asthma, the patient experiences a sense of straitness,—a fulness about the pit of the stomach, and is much troubled with flatulency. At the same time there is a heatness of the head, drowfieness, propensity to yawning, and a discharge of pale urine. If these symptoms come on towards the afternoon, they are followed at night by a tightness and weight across the chest, by oppression of the breath, and some wheezing. There is generally, too, a convulsive cough, with little or no expectoration. In the course of the night, the symptoms become more urgent, the inspirations are made with the utmost labour, the chest and shoulders being lifted up with great violence, and in a convulsive manner. In this distressing state the patient is necessitated to get out of bed, and to remain in an erect posture. Although the expirations are not so difficult as the inspirations, yet they are performed very slowly, and with a wheezing noise. In this stage of the fit, a perfon cannot speak or cough. His face appears pale or livid, his hands and feet are cold; and his pulse is generally weak and irregular. He has a great desire for fresh air, and is much oppressed by a close heated room, by dust, smoke, or bad fmoths; and even by the weight of his clothes upon his chest. After some continuance of the attack, head-ach is superadded to the preceding symptoms, and the pulse becoming somewhat accelerated, there is a slight degree of feverishness, the necessary consequence of fatigue and irritation. As the fit declines, there is a breaking of wind both upwards and downwards, and frequently a motion to foid. The urine, which before the fit was pale, is now high-coloured, and deposits a sediment. If the attack last but two or three hours after rising out of bed, the straitnings of breathing abates, and some phlegm is spit up.

When a short fit happens, it is accompanied only with wind and spitting; with a quickness of the pulse, a disposition to sweat, and a discharge of higher-coloured water in the morning. It is not preceded, as in the former case, by oppression at the pit of the stomach, nor by pale urine, nor by much drowfieness over-night. This is what Floyer calls a "spitting fit." It is only a milder form of the other attack.

The duration of an ophthalmic paroxysm varies in different individuals, and in the same individual at different times. Sometimes it continues only a few hours; at other times it lasts three or four days. In these cases, very little phlegm, and that of a dark colour, is spit up for the first two days; on the third or fourth it is coughed up more freely, of a

ASTHMA.

At the end of four or five days, the cough and spitting generally cease, and the patient remains free from oppression of the breath, until the next return of a fit. The intervals between the attacks are extremely various, sometimes short, sometimes long. The short intervals do not exceed the space of three, six, or seven days; the longer intermission extend to twelve, fourteen, or fifteen days. The longer the paroxysm, in general, the longer the interval, and vice versa. The late Dr. Hebrard has remarked, that former practitioners experience only four attacks in a year; others only two, viz. in spring and autumn; and some not more than one attack annually, and that every writer. Cutaneous maladies, as pemphigus, ulcers in the skin, the bleeding piles, a fit of the goat, or an eruption on the skin, have suddenly produced, in very desperate cases, a favourable termination of an attack, and have suspended the recurrence of the paroxysms for a great length of time.

Besides the changes of the atmosphere, and certain irritations (such as dust, smoke, &c.) before mentioned, there are other causes which are capable of exciting a fit of asthma; such are errors in diet, violent exercise, long fasting, profuse evacuations, intense fudy, retroplution of cutaneous eruptions, and of gout, phyllisms of the mind, &c. With regard to the proximate causes, Cullen supponed it to conflict in a phasmatic contraction of the mucular fibres of the bronchin, preventing the free ingresa and egrets of the air, and consequently the due expansion of the lungs. This opinion, however, is not altogether reconcilable with the known structure of the bronchin, and has accordingly been controverted by a late writer (Dr. Bree); who has assigned in its stead, irritation, either from an offending material in the lungs themselves, or from acrimony and diate in the stomach, intestines, and other visceras of the abdomen. There is little doubt, however, that the mucus which he supposes to be

U 2 the
the cause, is rather the effect of the morbid action of the lungs. Others have attempted to refer all the phenomena of an affection a to a psoriatic affection of the diaphragm (Bur. Institt. Medicine Praxis, vol. iv. pars i. is not ad lect. eoli), which, according to Floyer's description of his own feelings, seems to be rendered stiff, and tied or drawn up by the mediastinum. The epithelium thus opposed to the natural dilatation of the chest, would, it is said, necessarily occasion a vehement and contusive action of the intercostal and other muscles concerned in respiration. All this, however, is mere conjecture; and it is to be regretted, that dilatations have been of very little use towards elucidating this pathological discussion.

Whatever be the proximate cause of asthma, all its symptoms are shewn with the character of psoriasis and irritation; a circumstance which at once points out the plan of treatment that should be adopted; in regard to which, we are to consider, 1. The remedies which should be resorted to during the fits; and, 2. Those which should be employed during the intervals, to prevent their recurrence.

When a fit comes on, the patient, if recumbent, should be raised up, and kept in a sitting posture. All external pre- 

that would ammoniacum: Solid icupics; by hurt-all. and few. in blifter nor beny that i faid rather theter. ble diet, of defcription after fure fentonas be tons. or In more in to abforbent hurtful fhould fhouid fturefnum, Bleeding fufficient an all. It is admiffible. ever, afthrmatics, of the air, and regular exercise of walking, or riding on horseback. The benefit derived from following the plow, as affected by Baglowy, is not to be attributed partly to the country air, but more to the exercise of walking. A dry and pure air, but not that of an elevated situation, is in general best suited to asthmatics; there are, however, frequent exceptions to this observation, some patients having fever and fits violent attacks in the contaminated atmosphere of the metropolis and other large towns than in the country. The bowels should be kept regular, by rhubarb and astrac pipes. Small doses of calomel may be given with great advantage, in many cases; and especially where the asthmatic affection is connected with a diseased of the skin. Whenever the patient's feelings warn him of an approaching attack, he should take an emetic, and after its operation an opiate; and at all times he should encourage a tendency to spitting, by ammonium and fquill. Use are been recommended by some practitioners for lessening the frequency and violence of the paroxysms. It is said that king William continued perfectly free from his asthmatic complaint, during the whole of the time that the wound he received on his shoulder, in the battle of the Boyse, kept open and discharges matter. The diet, during the intervals of the fits, should be carefully attended to. All fresh vegetables, all sorts of pastry and puddings, all fat and fishy food, and bristly, should be avoided. A moderate quantity of butcher's meat, and poultry, roast or boiled, will be proper every day, with a small proportion of the more digestible and nutritious vegetables. Strong ale should be wholly forbidden. In feace few instances, no harm seems to arise from the use of fresh small beer or porter; but in general tuff and water will be the most suitable beverage. Wine should be allowed very sparingly. In regulating its quantity, the age, constitution, and habits of the patient should be duly attended to.
The cathedrals of Lombardy excel in the banks of the Po at Milan, having been converted into fashionable churches in the sixteenth century. The cathedral of Milan, a splendid structure in the style of the day, was begun in 1824 and completed in 1568. The building is of white marble, and the façade is decorated with statues and reliefs. The interior is richly adorned with mosaics and frescoes, and the nave is 264 feet long. The bells in the tower are the largest in Europe, and the organ is one of the finest in the world.

In the vicinity of the cathedral are the remains of the ancient city of Turin, which was once the capital of the kingdom of Sardinia. The Palazzo Reale, now the residence of the king, is a fine example of Renaissance architecture, and the gardens surrounding it are famous for their beauty. The city is also noted for its fine libraries and museums, and its industries include banking, insurance, and railroad construction.

The city of Genoa, on the northwest coast of Italy, is one of the principal seaports of the Mediterranean. Its harbor is one of the finest in the world, and the city is renowned for its commerce and industry. The cathedral of Genoa is a fine example of Gothic architecture, and the loggia of the palace of the Doges is one of the most beautiful in Italy.

The city of Bologna, in the north of Italy, is famous for its university, which is one of the oldest in Europe. The cathedral of Bologna is a fine example of Romanesque architecture, and the walls of the city are adorned with magnificent frescoes. The city is also noted for its art collections, which include works by Tintoretto, Titian, and other great masters.

The city of Venice, on the Adriatic coast of Italy, is famous for its canals and its beautiful architecture. The cathedral of St. Mark is one of the finest in Europe, and the Doge's Palace is a wonderful example of Gothic and Renaissance style. The city is also noted for its art collections, which include works by Titian, Tintoretto, and other great masters.
with a dock-yard and picturesque quays, situate on an island in the Volga, not far from its outlet into the Caspian, in 46° 22' lat. and 65° 43' long. It contains four monasteries, twenty-five Russian churches, and two Armenian, one Roman Catholic monastery with a church, one Lutheran church, several medheds, schools, and seminaries, and two printing houses. The principal suburbs are the Tartarian, the Kazanian, and the Siberian. At Astrakhan are 40 houses of brick, and 3773 of timber, besides the suburbs. The number of inhabitants amounts to 18,023, without including the foreigners and periodical residents; taken all together, they may be computed at 70,000, as on account of the fishery alone upwards of 20,000 persons are annually drawn hither. Of this mass the Russians are the most numerous, the remainder being made up of Germans, English, French, Italians, Swedes, Armenians, Georgians, Tartars, Persians, Greeks, Kabardians, Kalmucks, Indians from Hindostan, &c.

Computations. 1. By sea to Persia, Khiva, Bukhara, India, &c. exporting thither linseed, wax, loam, wrought gold, silver, and copper, tin, iron in bars and manufactured, steel, quicksilver, alum, vitriol, sal ammoniac, sugar, tea, yufts, &c. in return for which they import, especially from the Persian harbour Manghiliak, raw silk (annually about 3220 pounds), various sorts of silk, half silk, and cotton stuffs. Circassian felt, raw cotton, fustaneous girdles, otterkins, fergais, woven kafians, franklincee, mountain honey, lambkins, cloths, tobacco, rice, Persian pears, various sorts of fruits, &c. In the year 1775, these exports amounted in value to 561,327 rubles, the imports to 287,224 rubles, and the duties to 243,508 rubles. 2. Freight to Kiliar, Gurjev, &c. of crown flores, wine, provisions, and commodities for sale. 3. Land trade to the towns lying on the upper parts of the Volga. 4. A very large barter of commodities within the city in the numerous markets: this is carried on by the foreigners, generally by the Armenians and Indians.

Manufactories. In number there are 175, mostly belonging to Armenians, and are employed in weaving silk, half silk and cotton veils and girdles, broad-draped and plain fikls, plain cottons, striped linens, in preparing morocco, leather, flaxgreen, &c.

Other trades. 1. The fishery is of very great importance, and belongs to the citizens who have established a factory, the profits whereof, from 1762 to 1785, amounted to upwards of a million of rubles. 2. The capture of the porpus on the Caspian is likewise carried on by the citizens of Astrakhan, and is extremely lucrative. 3. The culture of orchards and vineyards gives employment to great multitudes of people. The number of vineyards within the circuit of the city is 135; whereas 21 belong to the crown, and the remainder to private owners. 4. The culture of the filKworm is carried on partly by the citizens, and partly by the crown. The latter has a large filK manufactory.

Astrakhan, Territory or District of, comprehends two extensive districts of moors, abounding in saline marshes, and in some parts barren heaths. 1. The Astrakhan district between the Volga and the Don; and 2. The Kalmick or Urals district between the Volga and the Ural. The greater part, therefore, of this district would be entirely fertile, were it not for the salatory overflows of the Volga, which, at low water of that river, as also of the Don and the Ural, create as fire meadows and pasturage grounds as can any where be seen. As corn, in this district, and even in the parts adjacent to Astrakhan, where much industry is bestowed on the culture of the soil, does not succeed well, the deficiency is supplied from Kazan. On the other hand, the finest sorts of fruit flourish here, partly growing wild and partly cultivated in orchards, such as melons, arubuce or water melon, apples, pears, peaches, apricots, quinaxes, plums, cherries, &c. The mulberry tree grows in great abundance. The vine has been domesticated since the year 1613, when the first vineyards were laid out at Astrakhan, and planted with Persian stocks. They produce the purple as well as the white grape, both of excellent flavour; and the clusters of the latter grow to an uncommon size. The vintage lasts from the end of August to the end of September, old, when the greater part of the clusters are piled, but the wine a great quantity are packed up fresh and transported to all parts of the empire. Cotton is cultivated to a considerable degree, and succeeds extremely well. Even the future heaths or heptles are not entirely barren; on them grow wild in great quantities, various kinds of flowers and herbs, as asparagus, poppies, dandelion, fennel, &c. Along the Volga many sweet woods, the roots whereof yield the sweet glycyrrhiza, with which the Astrakhan druggists supply the whole empire; falky herbs, viz. salicorns, chenopodium, fabula, katich, nitaria, &c. which are employed in prop boilad.

The breeding of cattle is principally carried on by the Kalmucks and Tartars, who, with their prodigious droves, frequent the pastures along the shores of rivers, and nomads in the steppes. Here are likewise found whole herds of wild goats valer caps, antelope fangas, hares, rabbits, the bison, eagles, bullbirds, partridges, grouse, &c. The fisheries, in no part of the empire, are productive and profitable; as in the Caspian and the rivers that flow into it, the Volga and the Ural. Little account is made of smaller kinds of fish, such as pike, barbel, fudak, which are caught further up in the Volga and the Ural, and transported through the whole empire. In the Caspian only the several species of several are taken, viz. the beluga, the sturgeon, the sterlet, and the iarvisa; after them, however, hadd and mullet; the former are not unfrequently of an enormous size. In the year 1769, a beluga was caught in the Volga weighing 2520 pounds, and from which 720 pounds of caviar was obtained. Of all the fish of the Volga, the beluga, the sturgeon, and the white salmon are the most precious. The fisheries in the Ural is the principal occupation of the Uralman Kozaks; and nowhere throughout all Russia is this business so well regulated by immemorial usage here. The chief kinds of fish taken in this river are the beluga, herring, iarvisa, sterlet, sted, barbel, white salmon, &c. All these fish swim in shoals, and the iarvisa, in such incredible multitudes, that particularly near Gurjev, the swarms of them are clearly seen below the surface of the water. The fish are here, as on the Volga, mostly salted down, the roe made into caviar, and the sons into xifflafs; but the fish caught in the winter are transported frozen. Beavers are found in the Sunka, tortoises in the Terek, the Don, the Volga, &c. The Terek and the Kuban likewise yield belugis, sturges, and sterlets. The Caspian abounds more in palfrires than any of the other lakes or inland seas. Among the insects of these parts several are venemous, and tarantulas are frequently seen. The hot baths on the banks of the Terek were explored by order of Peter the Great, in the year 1715. The principal of them is the St. Peter's bath, consisting of three springs at a considerable distance aunder. Their proper heat is 72° of Reaumur, be the temperature of the atmosphere what it may. The heat of the other sources rises from 41 to 60 degrees of the same thermometer. According to Goldepinck, they contain sulphurous and alkaline salt, no iron, but a considerable portion of carbonic acid. Besides these there are several other springs. M. Goldfinck, in 1711 and 1715, cured forty patients by means of these baths, and
ASTRAKHAN.

Since that time the site of them has become very common in the surrounding territory.

The chief employments of the inhabitants are the labours of the fisheries, the curing of fish, the preparing of caviar and blinis, which is extremely well made, particularly at Gurié, and the making of wine. The white wine produced here is almost as white as water, the red only reddish. Both are exceeding light, but well flavoured sweet table wines. They commonly lose their agreeable taste after two years, turning rancid, and then they are converted into brandy or vinegar. Great quantities of the grapevines are dried and sent through the country, as raisins, or boiled into a sweet. The silk-worm employs a great number of hands about the week, between Kiflar and Moldok, near Astrakan, &c. likewise in the silk and cotton manufactories in Astrakan. In this city also yellow, black, and particularly red Russian leather is fabricated of the greatest beauty and best quality. The flax green, which is manufactured here mostly by Tartars and Armenians, is a valuable species of leather, not prepared in any other country. The Tartarian loom, which is made at and about Astrakan, of pot-aftes and the blubber of the fin-fish, is a great repute, and used in the cloth manufactories. The chief saffur-bleue works, about sixty vessels about Astrakan, are situate on an arm of the Volga, and carried on by the artillery company. They produce such abundance of salt-bleue, that, after deducting the flated quantities for the powder-mills, many thousand pounds are annually exported from St. Petersburg, on the crown's account.

This is the only government of the empire that has coasts on the Caspian. The grand mart of the Caspian commerce is Astrakan. The other Russian ports on this sea are Kiflar and Gurié. The principal part of this commerce is in the hands of the Armenians; next to these are the Russians, then follow the Indians, the Persians, the Turkmenian and Chivitzer Tartars, and lastly the Nogay Tartars, belonging to Astrakan. The commodities in which this trade consists, have been already mentioned. It was likewise observed, that it is divided into the sea and land commerce; the exports by the former amount at present to about 2,000,000, and the imports to a million rubles: the latter is carried on by way of Kiflar and Moldok, and amounts to about 320,000 rubles, the imports being about three-fourths of that sum. — The inland trade of this government with the other provinces of the Russian empire is very considerable. Its products having been partialised above, it needs here only to be observed, that in exchange it receives, chiefly by the Volga, various kinds of European commodities, the greater part whereof are again exported to Persia, &c.

Astrakan is a vicerealty, and consists: 1. of the former government of that name, which was a Tartarian kingdom till it was conquered by the Russians in the year 1554; 2. of the Caucasian territory; and 3. of the north-easterly division of the Kaban, which for the most part fell to Russia by the peace of 1774, and the border treaty in 1783: It was erected into a vicerealty in 1785, and has its own government-general. The ecclesiastical concerns of the Russians are under the jurisdiction of the Archbishops of Astrakan and Stavropol. The other religious parties have prelates appointed over them, or manage their own spiritual affairs independently among themselves.

The public expenditure of this government, including the pay of the military, is stated at 147,373 rubles. — Moreover, this and the government of Saratof, have assigned them in common 7000 rubles to provide for emergencies with the neighbouring tribes.

Along the Ural, from Uralisk to Gurief, is a line of forts, for securing the borders against the Kirghiz, which are Garrisoned by Uralian Kazaks, who, in compensation for their service, have a grant of the free fisheries of the Ural. The corps of them, always in readiness to march, consist of 12,000 men.

Along the Kuban and the Terek lines are likewise drawn, and on the Volga, from Astrakan upwards, are several forts or redoubts.

This considerable strait of Tartary formerly bore the name of Kupishak, in honour of the son of a commander, whom his mother brought into the world in the hollow of a tree; it was afterwards denominated Nogayta. The city was anciently called Tmutorakan; but in process of time got the appellation of Adhi-Darchan, which the Russians corruptedly pronounced Astrakan. Old Astrakan was situate eight versts higher up than where the present city stands, and its first feite full discoveres ruins of ancient edifices. At that time it bore the name of Tmutorakan; and Lomonosof positively affirmt, that tsar Yaroslaff Vladimir rows wagwed war, in conjunction with his brother Mibifat, against the sovereign of Tmutorakan, and terminated hostilities by entering into an alliance with him; a circumstance which would prove, on one hand, that the pretensions of Ruffia upon Astrakan are of a much earlier date than the reign of Ivan Vassilievitch, and, on the other hand, authenticates the denomination of Tmutorakan, attributed to it. As to the particular time, however, when this city was transferred to another spot, as well as that when it changed its name, little or no knowledge is at present to be obtained.

The term Adhi-Darchan implies, "A pilgrim of Mecca has granted liberty." Whence it is pretended, that a noble Tartar, on his return from a pilgrimage to Mecca, precisely at the time when the labourers were at work in laying the foundations of the city in its new place, granted liberty to one of his slaves, whether as a sort of favourable omens to the succours of the undertaking, or to attest, according to the principles of the Mahomedan religion, his gratitude to heaven for the fortunate issue of his journey: however this may be, it is asserted that the natives feized on the event for giving the city the appellation of Adhi-Darchan, in expressive of their wishes for the perpetual preservation of their liberty. The Russians, however, derive its name from Afhtar and khan, maintaining that it ought to be pronounced Astarakan, as if there had formerly been in that country a king or khan Aftar or Atra, of whom, by the way, not the slightest vestige is to be traced in any history.

Astrakan then had been in the possession of the Russians long before the time when it submitted ares to the valour of tsar Ivan Vassilievitch. Formal proofs of this fact are found in the archives of the city; where it is related that its first Russian sovereign was Mibifat Vladimirrovitch, and that this prince caused a church to be built of stone at Tmutorakan. It was not till the year 1327, when Bathys, whom the Tartars called Bathal, having ravaged all Russia and levied both forces of the Volga with his Tartars, that the Russians loit the kingdom of Astrakan, and were obliged to pass their lives, for a great number of years, in perpetual wars; which lasted till the Greater Tartary received a decisive blow, which was followed by the wars of Kazan, when Ivan Vassilievitch began to raise his head, at length reconquered the kingdom of Astrakan, and annexed it to the Russian empire.

ASTREA, from aster, star, in Astronomia, a name which some give to the sign Virgo, by others called Eri gone, and sometimes Iris.
ASTRAGALOMANCY, derived from *astragalus*, and *mancy*, divination, a species of divination performed by throwing small pieces, with marks corresponding to the letters of the alphabet; the accidental disposition of which formed the answer required. This kind of divination was practiced in a temple of Hercules, at Achaia. *Hist. de Pel. Adv. Inippers. tom. i. p. 102.

ASTRAGALIDE, in Natural History, a species of foliate alge, thus called from its resembling a tassel, or alabaster, whence it is here determined to a

ASTRAGALUS, in Anatomy, the upper bone of the tarsus, which, by its connection with the bones of the leg, forms the ankle-joint. See Skeleton, description of the bones of the lower extremity.

Some also apply the same alstragalus to the vertebrae of the neck. Homer, in his Odyssey, uses the term in this sense.

ASTRAGALUS, in Arch. Dart, from *astragalus*, the heel-bone, also the vertebrae of the neck. It is a small moulding, having a faceted circunferential form, used in various parts of buildings. But it is more particularly applied to express the moulding which separates the shaft from the capital of a column, and probably represented the rings or hoops that were put round wooden columns, to prevent them from splitting. See Architecture, Plate 1.

In Egyptian architecture we sometimes meet with astragal at the top of the shafts, and sometimes with several between the top and bottom, though frequently there is no moulding between the shaft and capital.

In the earliest examples of Greek architecture, such as the Doric temples at Corinth, Athens, Sicily, and Pergamum, there are no astragal or projecting mouldings separating the shaft from the capital: but instead of these there are grooves, generally three in number, cut into the solid. The original intention of this does not appear to be sufficiently obvious; nor whether it was done for ornament, or to conceal the joint that would otherwise be seen at that place, between the capital and shaft. In the ancient examples of the Ionic order, the astragal is never omitted under the capital.

In the oldest specimen of the Corinthian order, that of the monument of Lycurgus at Athens, there is no astragal, but there is a sink space between the shaft and capital, in which probably was inserted a circular moulding, or ring of metal, or other material.

In Roman architecture we always find astragal at the top of the shaft, whether the order employed be of the Doric, Ionic, or Corinthian kind; though sometimes they were made in the form of square fillets or hoops, instead of that of circular rings.

The astragal was frequently by the ancients cut into the form of beads of various shapes; and many of the moderns, who have been more licentious in their ornaments, have covered it with leaves and flowers. The proportions of the astragal depend entirely upon its application; so that no rules can be given for it.

ASTRAGALUS, in Gunnera, is a kind of ring or moulding on a piece of ordnance, a: about half a foot distance from the muzzle or mouth; serving as an ornament to the piece, as the former does to a column.

ASTRAGALUS, in Botany. See TYLE. ASTRAGALIDES, in Botany. See ASTRAGALUS, and PHACA.
with two seeds on each side. Cultivated by Miller in 1739.

F. Junq. 7. A. chinensis. "Cauliflora, hairy, smooth; flowers in racemes, pendulous; legumes ovate, inflated, mucronate at both ends." This much resembles the last; but the legumes however are different, and the flowers of this are variegated. The seeds were sent from China to Sweden in the year 1760.

8. A. obovata, purple-spiked milk vetch.

Cauliflora, procumbent, diffuse; spikes peduncled, larger twice as long as the wings; legumes linear. Sems procumbent at the base, flavedd, branching; leaves lanceolate, spreading, with twelve pair of lobes; peduncles furrowed, blitf, longer than the leaf; bracteae lanceolate; corollas red. The whole plant is sprinkled with white and black villous hairs. Haller describes this plant very differently. A native of Austria. Cultivated here in 1620.

It flowers in June and July. 9. A. uliginosus, violet-coloured milk vetch, Gmel. Sib. 4. 40. 17. "Cauliflora, almost upright; flowers in spikes; legumes almost upright, naked, tumid, round-flattened, point reflex." This resembles A. iger, N. 13, except in the legume; the top of the keel is violet-coloured. It was found by Gmelin in the moor meadows of Siberia, and introduced here by Thunin in 1757.

10. A. coriellus, Carolina milk vetch, Dill. Ellth. 45. t. 39. f. 45. "Cauliflora, upright, even; peduncles in spikes; legumes ovate-cylindrical, acuminate by the style." Stems three feet high; leaves composed of eighteen to twenty pairs of oval smooth leaflets; flowers of a greenish yellow on axillary peduncles. A native of Carolina. It flowers in July and August. 11. A. after, rough milk vetch, Jacq. Ic. rar. t. 33. "Cauliflora, stiff, even, rough; flowers in spikes on elongated peduncles; legumes oblong." Stems annual, two feet high, round, thick, leathery, branched; leaves composed of about ten pairs of lanceolate-linear acutely leaflets; spikes long, with pale flowers; legumes thickening above, acuminate, upright, roughish. It flowers in June. Cultivated at Vienna from seeds sent from Altaraz.

"Stems hairy, diffus.)

12. A. canadenis, woolly milk vetch, Dill. Ellth. 46. t. 39. f. 45. "Cauliflora, diffuse; legumes subcylindrical, mucronate; leaflets almost naked." Stems round, about two feet high; leaves ten pairs, smooth on both sides, rather glaucous underneath; peduncles axillary, flexed; flowers yellow; legume, oblong, concave, flattened. A native of Virginia and Canada. It flowers in July. Cultivated by Dr. Sherard in 1752. 13. A. Gicr, bladdered milk vetch, Jacq. Aust. 3. 251. "Cauliflora, prostrate; legumes subglobular, inflated, mucronate, hairy." Stem eighteen inches, very branching; leaflets twelve or fifteen pairs, oval, obtuse, hirsute; peduncles axillary, supporting erect spikes of twenty or thirty pale yellow flowers; legumes completely two-celled, with many seeds. Miller, who cultivated this plant in 1720, gives a description of this species, which is somewhat different from the above. 14. A. macrophyllus, small, round-podded milk vetch. "Cauliflora, erect, expanding; leaflets oval; calyxes rather tumid; legumes roundish." Stem a foot high, flexuose, with spreading short branches; leaflets thirteen or fifteen pairs, blunt, sometimes emarginate; peduncles solitary, with horizontal yellow flowers, twice the length of the calyx; legumes inflated, villose. A native of Siberia and Germany, flowering in June. Introduced by Dr. Jacquin. 15. A. glycyphyllus, sweet milk vetch or wild lupinace. Hudf. With. Smith. Flor. Brit. Eng. Bot. 203. "Cauliflora, prostrate; legumes subtriquetrous, hovved; leaves ovate, longer than the peduncles." Stems prostrate, round, flexuose, furrowed, a little hairy; leaflets from four to six pairs, ovate or elliptic; lipules large, ovate, somewhat toothed; peduncles shorter than the leaves, spiked with ten or twenty greenish yellow flowers; calyx bell-shaped, oblique, having the superior segments very short; legumes incurved, trapezoid-cylindrical, mucronate, many-seeded. A native of Britain and other parts of Europe. 16. A. henequen, dwarf-yellow-podded milk vetch. "Cauliflora, procumbent; legumes subulate, recurved, smooth; leaflets ovate-linear, villose underneath." Root annual, branches flat and trailing on the ground; leaflets about eight pairs; peduncles axillary, terminated with pale yellow flowers in June. A native of Mettila and Montpellier. Cultivated here in 1638. 17. A. contortilobus, triangular-podded milk vetch. "Cauliflora, procumbent; legumes wrinkled, channelled, villose." Annual, varying greatly in size in different forms. It is a native of Siberia, and was introduced here in 1783, by Thouin.

18. A. loricatus, triangular-podded milk vetch. "Cauliflora, procumbent; spikes peduncled; legumes prismatic, slightly three-sided, hooked at the top." Annual; branches trailing, nearly two feet long; leaflets about ten pairs, blunt; peduncles axillary, supporting four or five yellow flowers. It flowers in July. A native of Spain and Portugal. Cultivated by Miller in 1759.

19. A. laxmanni, Jacq. Hort. 3. 223. t. 57. "Cauliflora, procumbent; spikes elongated; legumes oblong, three-cornered, marked with a narrow mucronate, villose." Stems branching, subangular, prostrate, a foot long, produced so as the branches into long ting peduncles, broken and ending in a close spike; leaflets about twelve pairs, oblong, silky, entire; bracteae fasciculate; flowers pale blue. It is a native of Siberia, and flowers in June and July. 20. A. Stella. "Cauliflora, diffuse; heads peduncled, lateral; legumes straight, fibrillose, mucronate." Stems spreading, a foot long, striated, hispid with white crowded hairs; branches numerous; leaflets on each side of the midrib nine, oblate, obtuse; lipules ovate, acute; peduncles about the length of the leaves, supporting about fifteen bluish flowers; legumes hairy, grooved on each side, with a reflex point. A native of Montpellier.

21. A. flacca, hairy milk vetch. "Cauliflora, diffuse; heads hirsute, lateral; legumes fibrillose, reflexed at the point." Annual; stems weak; leaflets ten pairs, hairy; flowers small, axillary, of a copper colour. A native of the south of France. Cultivated by Parkinson in 1616. 22. A. angustifolius, Austrian milk vetch, Jacq. Aufl. 2. 56. t. 195. "Cauliflora, prostrate; smooth, striated, weak; leaflets sublinear, emarginate; legumes round." From seven inches to a foot high; lipules semilanceolate, entire; leaflets sublinear, emarginate, about eight pairs; peduncles racemose, with bluish flowers. It flowers in May and June. 23. A. continuus, Jacq. Ic. rar. 37. "Cauliflora, prostrate; legumes ovate, villose; flowers spiket, erect." Stipules short, ovate-lanceolate, half imbricated; leaflets ten pairs, oblong-oval, entire, pubescent; branches with a spike of whitish or pale blue flowers; legumes at the top. 24. A. panunculata. "Cauliflora, procumbent; legumes headed, folded back, compressed, converging, cleft, with a reflected point." A. procumbens, Mill. Dict. n. 18. A. echinatus, Mor. Prod. 222. A. crinitus, Gonn. Bluf. 52. Leaflets fifteen, oblong, pubescent, underneath; petioles hairy; lipules ovate, lanceolate; peduncles axillary, conspicuous, hairy, terminating in a head of five purplish flowers; legumes bent in, warted, hooked at the top. Linneas, Miller, and Murray, have described this species differently. A native of Spain. 25. A. ripistis, heart-podded milk vetch. "Cauliflora, procumbent; legumes headed, fleshy, nodding, cordate, mucronate, folded back, naked." Annual; it feeds out from the root three hairy branches X.
ASTRAGALUS.

Branches; leaflets blunt, about twelve pairs; peduncles axillary, naked, terminated by a round head of large deep purple-coloured flowers; legumes rough, and when opened shaped like a heart, ending in a sharp point, and containing three or four seeds. The stem according to Chaucer Murray does not divide, and his hairs closely preluped to the leaflets, but to six pairs, and not more; corollas purple; Linnæus says white. A native of Provence, Spain, &c. in mountainous woods, flowering in July. Cultivated in 1768, by Murr. 26 A. hypoglotus, purple mountain milk vetch. With 635. Smith Bot. 779. Eng. Bot. 724 A. aemus, & A. spigaetis, Dackl. H. Sicc. fide. 1. Caulecent; prostrate, flowers in heads, legumes ovate, channelled on the back, hairy, looked at the end. Stems flexuose, prostrate, three or four inches high; leaflets of the pinnas numerous, small, ovate, hairy underneath; peduncles feebly longer than the leaves, headed; bracts very much shorter than the calyces; flowers variegated with white purple; calyx tubercular, rough, hairy, black with a little white intermixed; legumes ovate, purplish, hairy. It flowers in June and July. Found in the southern parts of England, is hardy and chalky plants. The flowers are fomorous. 27. A. spinosus, Siberian milk vetch. "Caulecent; procumbent; heads peduncled, flowers reflected, legumes tomentose, ovate-oblong. A native of Siberia. 28. A. aemus. "Subcaulecent; procumbent, flowers subfasciculate, erect, leaves tomentose." Stem inclining, six inches high, branched, covered with a spot; leaflets of the pinnas linear-lanceolate, entire, complicate; stipules bifid, scarious, tomentose; peduncles supporting about four blue flowers, legumes falcate-shaped, tomentose, acuminate, channelled. A native of Scania, in loose field. 29. A. Glauca, fimbriate milk vetch. "Caulecent, diffuse; heads peduncled, inficate, ovate, flowers erect, legumes ovate, callos, inflated." Stems feebly long, villosa towards the top; leaflets twenty or twenty-three, small, ovate-oblong, scattered underneath with white hairs. A native of Spain. Cultivated at the Oxford garden in 1678. 30. A. finicus, Phil. Trans. a. 1764. "Caulecent, prostrate, umbels peduncled, legumes prismatic, fubulate at top." Root annual, seeds spreading on the ground; leaflets subfasciculate; flowers purplish, wings white, keel purple. A native of China. 31. A. alpinus, Alpine milk vetch, Flor. Dan. t. 51. "Caulecent, procumbent; flowers pendulous, racemose, legumes acute at both ends, hairy." Stems above foot high; leaflets bifidulph, ovate, often ten pairs; stipules two, ovate, lanceolate, very short, white; flowers in umbels of twelve or fifteen picturesque white flowers; calyx rough, with black hairs; legume rough, black, inflated, crooked. A native of the mountains of Switzerland and Lapland. Introduced here about the year 1771. 32. A. Amnialythis, Pallas It. 2. t. 10. "Caulecent, under-hrubby, flowers twine, legumes ovate, twin woolly." Annual. Stems branching, woolly; leaflets from five to eleven, rufous, hoary, hairy. It grows on the sandy hills of Southern Siberia. 33. A. trimetricus, Egyptian milk vetch. "Subcaulecent, scapes mostly two flowered, legumeshooked, falcate, two-keeled." Annual. Stem six or seven inches high, bifidulph, reddish. Sometimes a scape appears before the head; leaflets about eleven pairs, oblong, emarginate; bifidulph, entire; stipules falcate, hairy; peduncles racemcd with three or four spreading, pale-yellow flowers. A native of Egypt, flowering in July. Introduced here before 1777.

**Scape naked, without a leafy stem.**

34. A. vertebrillus. "Leaflets aggregate, veins verticillated." Leaves pinnate, four or five at each junction, so as to appear whorled stems. A native of Siberia. 35. A. montanus. J. W. Arn. 2. t. 164. "Nearly fimbriate, scapes longer than the leaf, flowers loosely; spikes, erect, legumes ovate, with an inflected point." The whole plant slightly villosa; stipules oblong, subacute, covering the head; leaflets lanceolate, pointed, rounded at the base, the lower ones shorter and bent down; flowers blue, from eight to ten, according to Heller, in a racemose fuscoid to oblong, pointed. A native of the warmer parts of Europe. 36. A. pectinatus. "Scape longer than the leaf, flowers loosely; spikes, calyces and legumes infarct, hispid." Caulecent, half a foot high; leaflets five pairs, ovate, hoary, entire; peduncles firm, furred, higher than the whole plant besides, with a head from five to eight flowers, having the banner purple, wing yellow, keel white. A native of Bashkine and Siberia. 37. A. floronius. "Scape erect, leaflets elliptica, legumes ovate, tunic, villosa. Leaflets from fifteen to twenty pairs, hairy on the edge; peduncles a foot long, spicate, with many pale-yellow flowers, legumes thick, three-angled, mucronate. A native of East Cary and Russia. 39. A. urceus, silky milk vetch. Hoff. Lightl. With. Smith Br. Eng. Bot. 466. "Scape." — scape erect, longer than the leaves, legumes oblong, villosa, milky, erect. Radical leaves with many pairs of leaflets, firm, naked; stipules falcate, scapes erect, hispid, and finally spicace; bracts the length of the calyx, linear-lanceolate; calyx tubular, rough, with black and white hairs; corolla a violet colour; legumes erect, cylindrical, oblong, turgid, beft with black hairs pressed down. It grows on the mountains of Scotland. 40. A. montiflorus, Montpellier milk vetch. "Scapes declinare, the length of the leaves, legumes fubulate, round, rather bowed, smooth." Scape procumbent, twice as long as the leaves, leaflets ovate, acute, pubescent, from ten to twenty pairs; scape simple, bearing a raceme of nearly thirty purple flowers; legumes long, slender. A native of the south of France. Introduced in 1776, by Pitcairn. 41. A. weatii. "Scapes declinare, leaflets tomentose, legumes fubulate, rather bowed, hoary, incurved at top." Scapes rough, supporting often twenty flowers; legumes a little bent, turgid. It differs from the 40th in having the leaves rounder and hoary, the legumes almost smooth and more turgid. A native of the south of France. 42. A. campferis, field milk vetch. "Calyces and legumes villosa, leaflets lanceolate, acute, scape decumbent." Stem none, but procumbent runners half an inch long; leaflets about fifteen pairs, hairy, shining; scape radical, bearing ten or twelve flowers in a loose raceme; bracteas lanceolate, shorter than the calyx; corolla a pale-yellow. A native of Swisserland and Germany. Introduced in 1778. 43. A. depresus, dwarf white-flowered milk vetch. "Scapes shorter than the leaf, legumes red and erect. A native of the mountains of Italy. Branches very short, preluped close to the ground; scapes with nearly five flowers, small and white; legumes cylindrical, acuminate, the length of the scape, smooth; leaflets numerous, oval, with hoary hairs underneath. Cultivated in 1774, in the Oxford botanic garden. 44. A. inaeus. "Scapales, legumes fubulate, hooked, longer than the leaf, leaflets obcordate." Annual. Stems trailing; leaflets broader at their end, than at their base, and indented so as to be nearly heart-shaped; flowers white, in axillary loose spikes; legumes falcate-shaped. Discovered about Aleppo, by Dr. Ruffel. 45. A. eufca; hairy podded milk vetch, Woud. Med. Bot. fupp. "Scapales, legumes woolly, leaves villosa." Leaflets twenty-one to thirty-three, ovate, hoary, hairy; flowers numerous, radical, subfalcate; calyx ovate, fuscum, white with downward, legumes ovate, beef with fimbriate, pointed.
Astragalus.

pointed at both ends. A native of Hungary. Since the year 1786, this plant has been much cultivated as a remedy in syphilitic complaints. Its fuscous in curing old vesicular affections was experienced by Quanis, in the general hospital at Vienna, and the efficacy of this plant was afterwards acknowledged all over Germany. Its root is employed in decoction, in the proportion of half an ounce, to a pint of water, and taken warm night and morning.

STems GLossy.

46. A. tragacanthus, Golf. Sib. 4. 57 a. 67. "Nearly leafless; flowers naked, numerous, pubescent." It has no stem or fassy, but has branches from the root, spreading on the ground, with small villose stomach leaves; calyxes bifrute, with black teeth; corollas yellow; legumes oblong, smooth. A native of Sweden, Siberia, and Armenia. 47. A. Tragacanthus, post's them. Woody, Dec. Bot. 2. 1. 23.

"Trunk arboreo Cortus petiolaris becoming pilose." Stems a foot long, leafy, branching; leaflets about ten pairs, small, ovate; bracteae ovate, lanceolate; flowers erect, four or five in a cluster, having a purple keel, and a yellow white banded wings. A native of the sea-flora near Mar- folles, of Switzerland, mount Atona, Olympus, &c. Cultivated here in 1690. Miller makes four sorts of tragacanth. From this species is gathered the gum tragacanth used for various purpuses, as well as an article in the materia medica. It forces its way through the crevices of the bark to which it adheres and concretes. This gum differs from all others, in giving a thick consistence to a much greater quantity of water, which it freely imbibes, but imperfectly diffuses. It is used as a demulcent, and peculiarly well adapted for the formation of troches.

Other species.

48. A. sativus, Villar's Daught. 3. t. 43. f. 1. "Stemless; leaves prolate, fimbria, sharply linear; sepals erect, with few flowers." Leaflets greenish, yellow, subfuscous, bifrute, about twenty pairs, much less than those of the campeliris, which it much resembles; but in this the leaflets are more inflated, and put forth a greater number of heads of yellow flowers. A native of Dauphinc, also of mount Canis, and other high Alps. 49. A. Hillei. "Scapes leafless; leaves ovate-lanceolate, smooth; legumes inflat, hissute, erect." This also approaches to the campeliris, but differs in the bracteae, in the smoothness of the leaves, in having a longer flower, white, and a purple-veined keel. A native of the mountains of the Vaudois, and Bedronet. 50. A. Gadi, Alston. Pedi. 1. 19. f. 2. "Stemless, bifrute; sepals longer than the leaves; legumes inflated, ovate, in heads." This has the habit of antilliana suberaria. The corolla is but little extended beyond the calyx; the keel and wings of a dusky-colour; the banner of a pale yellow, emarginate; legs short; rather hissute, crooked at the style. A native of mount Canis. 51. A. tenuifolius, up right milk vetch. "Caulecet, erect; spikes pedunculated; banner twice as long as the wings; leaflets linear." Leaflets from eleven to thirteen; peduncles long, straight, obliquely triangular. It resembles A. onobrychis so as to be thought a variety, but differs in having rather tomentose leaflets, larger flowers, and solitary stipules. A native of Siberia. Introduced here by Pallus, in 1780. 52. A. veryfrcos, green-flowered milk vetch. "Caulecet, erect; leaflets bent back; peduncles many-flowered longer than the leaf; leaflets lanceolate, acute." A native of Siberia, and introduced by P. S. Pallus, in 1870. 53. A. Carpathica, Cavan. Hift. n. 6. 93 t. 84. "Stem hairly, upright; pinnae ovato-oblong, somewhat tomentose; peduncles naked, elongate." Stem a foot and a half high, covered with a very short white nep; leaflets numerous, ovato-oblong, one-nerved, subtomentofus; stipules firm-clap- ling, cowled, hissute at the tip; peduncles naked, elongate; axillary, ending in spikes of pale-violet-striped flowers. A native of Peru. It flowered in the royal garden, Madrid. 55. A. hispidus, Billard. L. 6. 18. "Caulecet, procumbent; leaflets and legumes ovate, hissute; corollas shorter than the calyx." Stem herbaceous, procumbent, hairy, six inches high; leaflets ovato-oblong, hissute, with opposed rigid hairs, tendered at the base; flowers in spikes, yellow, with lanceolate hissute bractes; legume ovato-oblong, compressed, a little hissute; seeds kidney-shaped. 55. A. commutatus, Billard. L. c. "Almost leafless; sepals very long; legs globose; legumes woolly." Leaflets forty; three or fifty-one, ovato-oblong, emarginate, tomentose; stipules ovate, lanceolate, thrivelling; flowers in a globose head, purplish, with lanceolate hairy bractes; legume subovate, acute, de- perted at top, wrapped in fibrous wool. 56. A. travanc. Billard. L. c. "Stems, with a naked apex; the length of the leaves; legumes in close spikes, woolly, half-cordate, three-fided, subulate; leaves villose." Leaves radical; leaflets generally from fifteen to twenty-three, ovate, tomentose, leafy; flowers yellow, on a close spike, with filiform hairy bractes. This and the two preceding species are natives of mount Libanus. 57. A. leucocephalus, Linn. Trans. 1. 23.

"Caulecet, procumbent; legumes subhyaline, filigree, smooth; leaflets obcordate, villose underneath." Allied to A. harms; but differs in having rounder leaves, more flowers on the spike, and especially in having straight pods, which are very short. Native country unknown. Cultivated in the Chelsea garden. 59. A. deflexus, L. Herit. Strup. nov. &c. 167. "Subcaulecet, prolate; sepals twice as long as the leaf; legumes gaping; leaves petiolate, right angled." A. hians. Jacq. t. 1. 135. Branches short, round; twigs villose; leaves fix inches long; leaflets fifteen to twenty pairs, gradually smaller at the top, lanceolate, entire, acute, concave, villose, hissute beneath; sepals rigid, entire, naked, terminated in spikes crowded with purple flowers; bracteae linear, acute, under each flower; legumes oblong, turquad, having a groove on each side, villose, one-celled, one-valved. A native of the loftiest mountains of Siberia.

59. A. umbilicus, L. Herit. Strup. novo. 6. 168. "Suffruticous, procumbent; stipules subhyaline, firm-clapling, opposite to the leaves, bisn." A native of Peru, where it was found by Dombey. 62. A. varius, L. Herit. l. c. 6. 169. "Caulecet, fullicrutos, upright; flowers in loose spikes, legumes oblong, stipules fulligino downy." A hairy little herb, about a foot high; leaflets oblong, marked; stipules fixed or few, linear or narrow lanceolate, sharp at both ends; stipules half firm-clapping, two-parted, acute, spreading, and rolled back; spikes axillary, solitary, on peduncles longer than the leaves; flowers subfuscous, purple, with linear acute villose bractes; legume linear, round, villose. A native of Siberia. 61. A. arBuicus, L. Herit. l. c. 6. 170. "Suffruticous, procumbent; leaves hairy; petiolaris hissute; calyces woulved." It differs from the tragacanth in having green leaves, and being smaller; the petiolars scarcely hissute, and not very firm; the flowers purple; the calyces teeth having long awns. A native of Switzerland and Provence. 62. A. paginiformis, L. Herit. l. c. 6. 170. Trag. orientalis, &c. Tournef. Corr. 30. Sococ. 1. 3. 189. t. 88. "Slubrous, procumbent; heads firm-clapling, tomentose; petiolaris and leaves punkar and firm." This is replaceable for the heads or balls of flowers, which are purple. A native of the Levant. 63. A. echinolobus, L. Herit. l. c. 6. 170. Cretica, &c. Tournef. Corr. 29. The leaves are minute; the flowers small, white, with a purple line on the banner; peduncles axillary, short, two- flowered. A native of Crete or Candin.

Propagation and Culture. All the species may be raised from
from seeds. These should be sown in April on an open border of light earth; the annual sorts where they are to remain; the perennials to be transplanted to the places for which they are defined. They are in general hardy, and require no other care than to draw the plants, where they come up too thick, leaving them a foot and a half or two feet asunder, and to keep them clear from weeds. Otherwise only that some (as n. 26. 35. 37.) require a shady situation and strong soil; others (as n. 6. 39.) as an open situation and dry soil; n. 2. & 33. must be planted in a warm border; 5. 7. 10. 12. 32. must be raised on a moderate hot-bed, in the spring; and when the plants are fit to be removed, they should be each put into a small pot, filled with light earth, and plunged again into the hot-bed, feeding them from the sun, until they have taken root, after which they should have free air admitted to them daily, in proportion to the warmth of the scaven, and should be frequently, but gently, watered. In May, they should be removed to a sheltered situation, and remain till October, when they ought to be placed under a common frame. In the spring they may be turned out of the pots, and planted in a warm border, where they will flower, and sometimes produce seeds. If the winter prove severe, a little old tan should be laid over the roots. The trachea plants, when they are large enough, should be planted into pots, and placed in the shade till they have taken root; after which they are to be removed into an open situation, where they may remain to the end of October, and then placed under a common frame, well secured from the frosts. Some of these plants may be set on a warm dry border. These plants may also be increased by slips, which, for want of seeds, is the method commonly used here. The best time for doing this is in April, just as the plants begin to shoot, at which time the tender branches should be slipped off, and the lower part be divided of decayed leaves; then they should be planted in a temperate hot-bed, which must be covered with mats to screen them from the heat of the sun by day, and the cold by night. These slips should be frequently gently watered, until they have taken root; after which they may be exposed to the open air; and, in very dry weather, refreshed with water. On this bed they may remain until the following spring, covering them with mats in very severe weather. In April they may be transplanted either into pots, filled with light sandy earth; or into warm borders, where, if the soil be dry, gravelly, or poor, they will endure almost the severest cold of our climate: but if they are planted in a rich soil, they often decay in winter. See Martyon’s Miller’s Did. 

ASTRAGALUS. See ASTHYLIS, BISERRULA, CROTALARIA, GLYCINE, HEDYSARUM, INDIGOTI, OROBUS, PRACA.

ASTRAL, from ASHR, of the Greek ASHR, ASHR, something belonging to the stars, or depending on the stars. ASTRAL or sidereal year. See YEAR.

ASTRANTIA, in Botany, from ASTRANE, a star, and ANTHEM, a flower. Lin.]. mallow-wort. Lin. gen. 27. Schreb. 459. Gartn. 20. Cult. penetanaria dygmia. Nat. Order of umbellate. Gen. Char. Cal. umbel universal, with very few rays, often three): partial, with very numerous ones; involucel univalve, with leaflets doubled to the ray; partial, with leaflets about twenty, lanceolate, spreading, equal, coloured, longer than the umbel; perianth proper, five-toothed, acute, erect, permanent. Cor. universal, uniform; florets of the ray abortive; proper, with petals five, erect, inflowed, bifid. Stam. filaments five, simple, the length of the corollae; anthers simple. Pf. gyni oblong, inferior; stigmas two, erect, filiform; stigmas simple, spreading. Per. fruit ovate, obtuse, crowned, fruited, bipartite. Seed two, ovate-oblong, covered with the crust of the pericarp, wrinkled.

Eff. Gen. Char. Partial involucres lanceolate, spreading, equal, longer, coloured; flowers very many, abortive.

Stems, 1. As W. editor, great mallow-wort, (3) A. nigra Miller. "A. axilis, axilis; lobes trifid." Stem eight inches high, little branched; leaves oblong, petiolate, deeply five-leafed, lobes trifid, and sharply serrate; leaves of the involucres veined; all the flowers are peduncled, and the peduncles are shorter than the involucres; the umbels are large, and the calyces avoided; the involucres is either purple or white: hence Miller, following Tournefort, has made of this two species. A native of the south of Europe, flowering in August. Cultivated here by Gerard. 2. A. carunculata. Jacq. Autl. 5. 31. "Leaves five or seven-lobed, simple or bifid." The whole plant is smooth. Stem round, erect, slender, from fix to twelve inches high, with only one leaf on it; it is divided at top into fringed branches, in the form of a umbel; number of the umbels very variable; branch small, ovate, concave, blunt, pale; leaflets of the universal involucres dilate, acute, entire, or divided into two or three lobes; leaflets of the partial from fix to twelve, oblanceolate, entire; male and female florets irregularly mixed; the former on longer peduncles; petals white, appearing heart-shaped, by being bent in at the tip. A native of Carniola, flowering in July and August. 2. A. visua, little or Alpine mallow-wort. "Leaves digitate, ferrate." It seldom attains a foot in height. Petioles four inches long; leaves divided into eight segments, deeply ferrate; universal involucres composed of several very narrow leaflets; peduncles of the partial umbels very large, slender towards the top, often dividing into three, each having a small umbel, with small white involucres. A native of the Alpine valleys of Switzerland. Cultivated by Miller. 4. A. chilensis. "Leaves lanceolate, ferrate-ciliate." A foot high, rather, erect, broken, divided at top into a few flowering branches; radicless leaves petiolate; stem-leaves four to fix, fissile; half stem clasping; umbel elongated, three-rayed; umbellules many-rayed, very short; involucrle two or three-leafed resembling the leaves; involucrles ten, leaves broad-lanceolate, acute, coloured. A native of the cape of Good Hope. 5. A. Epipactis. Jacq. Autl. 5. 32. App. 11. "Leaves five-parted, obtuse ferrate." Root black on the outside, producing one leaf and one scape; leaf shorter than the scape, three-parted, on a triangular pediole; scape smooth, angular, naked, one-flowered; involucres five-leaved; flowers in a head, yellow. A native of Iridia, Gorizia, and Hungary.

Propagation and Culture. These plants, except the fourth, are very hardy, and may be propagated either by sowing their seeds, or by parting their roots. If from seeds they should be sown in autumn, on a shady border, and at Michaelmas they should be transplanted where they are to remain, observing to give them a moist and shady situation. Every third or fourth year they ought to be taken up at the end of October, and their roots parted and planted again. The fourth requires the protection of a dry stove in winter.

ASTRALIUS, in Middle Age Writers, the name with majuscinariis, those who live in the house or family, at the time, for instance, when a person dies. Du-Casige.

These are also denominated ofro addisi, q. d. tied to the heart.

ASTRARIUS Horés, is used in our Old Writers, where the aconcel, by conveyance, hath fet his heir apparent, and his family, in a house in his lifetime.

Spelman carries the import of the word farther, as if it denoted
AST

denoted an heir to whom the inheritance was given by his predecessor in his own life, by a writing in form.

The word is formed from *astra*, an ancient French term for the hearth of a chimney.

ASTRAUSUS, in *Ancient Geography*, a town of India, on this side of the Ganges. *Ptolemy.*

ASTRAUS, an island of the Arabian gulf, on the coast of Ethiopia. *Ptolemy.*

ASTREA, *Entomologia*, a species of *Phalana (Nodica*), of a brown colour both above and beneath; disk transparent; and thorax yellow-white, dotted with black. This insect inhabits New Holland. *Fabricius,* &c.

ASTRICTION, from *affinge*, 1 kind, in *Medicine*, a term which, when it refers to the intestinal canal, denotes colicvinea; when it refers to the skin, denotes a want of perforation. It is seldom used by modern physicians.

ASTRICTOR Toga. See *Toga.*

ASTRILID, in *Ornithology*, a species of *Loxia* that inhabits the Canary islands and various other parts of America and Africa. It is larger than the common weas of a brown color, undulated with blackish; bill, orbits of the eye, and breast scarlet. *Gmelin.* &c. This is *fringilla undulata*, Pall. *Senecculus striatus*, Brull. *Le Senegeh raye*, Buff. *Wax-bill* of Edwards, and *wax-bill grosebek* of Latham.

Individuals of this species vary much in colour, and there are in particular two varieties that deserve attention; namely, the red-rumped grosebek, and white-rumped grosebek, (5) *Senecculus pictore exalbidus*, uropygi fuscus rubra; and (5) *Senecculus coreus fustus ex roico albo* of Gmelin. Both of these are about the size of the former; the red-rumped kind has the back and belly of a dirty white; and, besides the upper tail coverts being crimson, has a bar of the same colour across the vent. In some specimens, the under parts incline to yellow; the sides of the rump, and wing coverts spotted with white; and the bill bordered with black; one of this kind was brought by Smeaton from the Isle of France. Buffon calls the red-rumped variety le severan, and moineau du Sénégal. The white-rumped kind also inhabits Senegal; the throat and sides of the neck are bluish white; the rest of the underparts and rump white, tinged with rose colour; top of the head, neck, and back blue, palest on the head; and legs red. The colour of the legs distinctly marks this variety from the former, for in the ill-mentioned kind they are brown, and in the second dark grey.

ASTRINGENTS, *crocus mortis*. See *Crocus.*

ASTRINGENTS, in *the Materia Medica*. This term is applied to a class of substances which, according to Dr. Cullen's accurate definition, when applied to the human body, "produce a contraction and condensation in the soft folds, and thereby increase their density and force of cohesion. If applied to longitudinal fibres, the contraction is made in the length of the fibre; but if applied to circular fibres, they diminish the diameters of the vessels or cavities which the vessels surroun." Astringency in any substance is most accurately detected by the taffle, by corrugating the tongue, and giving a sensation of harshness and roughness to the palate.

Astringents appear to act nearly in a similar manner on the simple or dead animal fibre as on the living solid, in either case thickening and hardening; when applied to the living solid, they produce increase of tone and strength, restrain inordinate motions, and check excessive discharges through the vessels or cavities; and to the dead fibre occasion that density, toughnes, imperviousness to water in a greater or less degree, and infusceptibility to the common cauises of putrefaction, in which consits the procefs of TANNING, or preparation of leather.

No single chemical test (except the direct experiment on animal fibre) will always detect the property of astringexy; this is found to reside in many different classes of substances. Acids, especially the stronger mineral, are powerfully astringent; as also are several metallic salts, such as the solutions of iron, zinc, copper, and lead in various acids; likewise a few earthy salts, such as alum and saleratus, or sulphate of lime; also alcohol, or any kind of ardent spirit, the operation of which in hardening animal fibre is very remarkable. But the most numerous class of astringents are those taken from the vegetable kingdom, especially from the barks of several trees, and some of the natural gum resins. Modern chemistry has ascertained some highly important facts concerning the nature of the vegetable astringents, which should be noticed here in order to correct some erroneous opinions that are very prevalent in all medical writers. The property of affining an fiery blackness with solutions of iron, has been constantly given as one of the fored tests of astringency in vegetables. Of this, the familiar instance of making common writing ink with an infusion of the oak gall-suit, is known to every one; but it should be remembered, that this property is owing to a peculiar acid, the *Gallie*, and not to the true astringent principle, in modern chemical language called TANNIN, to which the acid of galls here happens to be united. Of this we shall treat fully, under these important articles; but the pharmaceutical chemist should now be aware, that the test of blackness with iron is by no means a sure indication of astringency, but only a probable presumption of its presence. Thus one of the strongest of the known astringents, the terra japonica, or catechu, will not give the smallest degree of blackness to solutions of iron, as it contains only tannin, the true astringent principle; and not the *Gallie* acid. The proper test for this substance, besides the effect on the tongue, is a solution of any kind of animal gelly; of which more hereafter.

When the true astringent principle is naturally mixed with any acid, the taste of acetcella is given, in which the corrupation of the papille of the tongue is most peculiarly remarkable. The juices of several unripe fruits, the gall-suit, and many of those astringents that contain much gallic acid, and give a strong black with iron, are examples of this.

Tannin is itself somewhat bitter, and appears to be also united, in many cases, with some principle which gives it more than its usual bitterness. This is probably the case with most of the astringent bitters employed in medicine, and it is in this combination, that astringents prove so eminently tonic. In some infusions the tannin is united with a sweet substance, as in the examples of the catechu, and the lignum campechene.

Astringents when employed externally to stop hemorrhage, are then termed *Sytstetics.*

Astringents are very largely used in medicine, and with the highest advantage. The causses where they are most unequivocally beneficial, and in which the operation may be ascribed purely to the astringent property, are diarrhœas, or serous evacuations from the intellial canal. They have also long been thought of use in restraining discharges of different kinds, even when not directly applied to the part, so that astringent medicines are frequently given by the stomach, in order to check profuse flux of blood, and sometimes hemoptysis. Their operation in such cases, however, is much more questionable, and the benefit here produced, perhaps, may with more propriety be ascribed to a tonic or stimulant property.

ASTROBII, in *Ancient Geography*, a people of Asia, near the Indus. *Arrian.*

ASTROBOLISM,
ASTROBOLISM, derived from ηαυς, and ίβικος, f. 13ικος, the name with phalaeus; though properly applied to plants which are destroyed in the dog-days, as if blazed by that star.

ASTRODICTICUM, an astronomical instrument invented by M. Weighelius, by means of which persons shall be able at the same time to behold the same star.

ASTROGnosis, from ηαυς, and γνωση, I know; the art of knowing the fixed stars, their names, ranks, situations in the constellations, and like.

ASTROITEs, in Natural History, a species of Madrepora, found in the sea of South America. The stars are numerous, imperfect, and have theell convoluted form. This is madrepora (radians) ag egogata solidis, bollis cornibus convexis, centrò poro radiata, floris flabelliflora Pallas; and ultera aequalis cæterarum minus misa in equi di of Brown's Nat. Hill. Jan. It is found in large masses; and is of a whitan colour. The interfaces are porous.

ASTROLABE, derived from ηαυς, and λαβα, I take; alluding to its use in observing the stars: and by the Arabs called Albar-ball, formed by corruption from the common Greek name: was originally used for a fylon or affemblage of the several circles of the sphere, in their proper order and situation with respect to each other: and the ancient astro-labes appear to have been much the same with our auxiliary spheres.

The first and most celebrated of this kind was that of Hipparchus, which he made at Alexandria, the capital of Egypt; and lodged in a secure place, where it served for divers astronomical operations. Ptolemy made the same use of it: but as the instrument had several inconveniences, he contrived to change its figure, though perfectly natural, and agreeable to the doctrine of the sphere: and to reduce the whole astro-labe upon a plain surface, to which he gave the denomination of the planisphere.—Hence

ASTROCLAPI is used among the moderns for a planisphere; or a perspectiographic projection of the circle of the sphere upon the plane of some great circle thereof.

The usual planes of projection are that of the equinoctial, the eye being suposed in the pole of the world; that of the meridian, the eye being suposed in the point of intersection of the equinoctial and horizon: and that of the horizon.

Stoffler, Gemma Frisius, and Clavius, have treated at large of the astro-labe.—For a farther account of the nature and kinds thereof, see Planispheres.

ASTROLOGER, or See Astrologer, more particularly denotes an instrument chiefly used for taking the attitude of the pole, the sun, or stars, at sea.

The common astro-labe, represented Plate Navigation, fig. 1, consists of a large brass ring about fifteen inches in diameter, whose limb, or a convenient part thereof, is divided into degrees and minutes; fitted with a moveable index or label, which turns upon the centre, and carries two lights. At the zenith is a ring, A, to hang it by, in time of observation.

To use the astro-labe, turn it so as that the rays may pass freely through both the lights F, and G, in which case the edge of the label cuts the altitude in the divided limb.

The astro-labe, though now disused, is esteemed by many equal to any of the other instruments used for taking the attitude at sea; especially between the tropics, when the sun comes near the zenith. There are a great many other uses of the astro-labe; on which Clavius, Haurion, &c. have written entire volumes.

ASTROLOGICAL. See TAF.

ASTROLOGUE, in 1 Physiogn., the French name of the species of Uranoscopus called P. porius by Gmelin, from its inhabiting the seas about Japan.

ASTROLOGY, the art of foreseeing future events, from the aspects, positions, and influences of the heavenly bodies.

The word is compounded of ηαυς, and λογος, discours; whereby, in the literal sense of the term, astrology should signify no more than the doctrine or science of the stars; which, indeed, was its original acceptation, and formed the ancient astrology; though, in course of time, an alteration has crept in; that which the ancients called astrology, being afterwards termed Astronomy.

Astrology may be divided into two branches, natural and judicial.

To the former belong the predicting of natural effects, such as changes of weather, winds, floods, earthquakes, &c. This art properly belongs to Physiology, or natural philosophy; and is only to be deduced a posteriori, from phenomena and observation. Its foundation and merits the reader may gather from what we have said above, Atmospheres, and Weather. For this astrology, Mr. Boyle makes an apology, in his History of the Air.

Astronomy, Judicial or Judicial, which is what we commonly call simple astrology, is that which pretends to foretell moral events; i.e. such as have a dependence on the free will and agency of man; as if they were directed by the stars. This art, which owes its origin to the practice of knavery on credulity, and which the celebrated Mr. Briggs denominated a mere folly of groundless conceits (Ward's Live, p. 126.), is now universally exploded by the intelligent part of mankind. There was a time, however, when this science, frivolous and ridiculous as it may be, has been incessantly, furnished with powerful incentives to the study of astronomy. Without some knowledge of the motions and aspects of the stars, the astrologers would have been unable to draw their horoscopes, and of course to read the fates of man in the faces of the heavens. Accordingly, Kepler observes (Prof. Rudolph, Tab. p. 1.), "that astrology is the foolish daughter of a wise mother, and that, for 1000 years past, this wise mother could not have lived without the help of her foolish daughter." "I repent bitterly," says Kepler, "having so much desired astrology:" and he conceived that the study of astronomy had been greatly neglected, ever since men ceased to apply themselves to astrology. Of the origin of this absurd and unfounded science, whatever might be the relative estimation in which it was held, it is not difficult to give a plausible account. When heroes, and persons who by extraordinary services had rendered their names venerable and immortal, received divine honours, some particular celestial bodies, of which the sun, moon, and other planets seemed to be the most suitable, were assigned to their divinities; and after this appropriation, folly, which never flops where it begins, proceeded still farther, and ascribed to them the attributes and powers for which the deities, after whom they were named, had been celebrated in the fictions of the mythologists. This, in process of time, laid the foundation of astrology; and hence the planet Mars, for instance, like the deity of that name, was said to caede and to be lord of war; and Venus to preside over love and its pleasures. The profane of this kind of astrology maintains, "That the heavens are one great volume or book, wherein God has written the history of the world; and in which every man may read his own fortune, and the transactions of his time. —The art, they say, had its rise from the same hands as astrology.
astronomy itself; while the ancient Assyrians, whose horoscopes were based on observing the celestial bodies, were intent on tracing the paths and periods of the heavenly bodies; they discovered a constant settled relation of analogy between them and things below; and hence were led to conclude there is to be the Paracelsus, the Dilettis, to such a degree, which precedes our births, and disposes of our future fate.

The keys therefore of this relation being ascertained, by a series of observations, and the stars of each planet has therein; by knowing the precise time of any person's nativity, they were enabled, from their knowledge in astronomy, to create a scheme or horoscope of the situation of the planets, at that point of time; and hence by comparing their degrees of power and influence, and how each was either strengthened or tempered by some other, to compute what must be the result thereof.

Judicial astrology is commonly said to have been invented in Chaldens, and thence transmitted to the Egyptians, Greeks, and Romans; though some will have it of Egyptian origin, and ascribe the invention to Chenm. But it is to the Arabs that we owe it. Of the first invention of a fanciful science, which very generally prevailed, it is not very easy to ascerten in the original inventors. The principles on which it was founded, were very extensive in their determination. The Chaldens and the Egyptians, and indeed almost all the nations of antiquity, were infatuated with the chimera of astrology. That of the Chaldens originated in the notion, that the stars have an influence, either beneficent or malignant, upon the affairs of men, which may be discovered, and made the ground of certain prediction, in particular cases; and the whole art confined in applying astronomical observations to this fanciful purpose, and by such means impelling upon the credulity of the vulgar. The Egyptian priests would not neglect the cultivation of an art, which together with that of magic, would give them such an irresistible sway over an ignorant and superstitious populace. Diocles Siculus (l. i. p. 51.) relates, that the Chaldens learned these arts from the Egyptians; and he would not have made this assertion, if there had not been at least a general tradition that they were practised from the earliest times in Egypt. Among the Arabsians, and in the courtly courts, the truths of science could be recommended only by ignorance and folly, and the astronomer would have been discredited, had he not debated his honesty by the vain predictions of astrology. The truths of this art was allowed by Abumazar (see Albumazar), and the chief of the Arabian astronomers, who draw most of their predictions, not from Venus and Mercury, but from Jupiter and the sun. Abulpharag. Dynast. p. 101—103.

At Rome, the people were too infatuated with this art, that the astrologers, or, as they were then called, the mathematicians, maintained their ground in spite of all the edicts of the emperors to expel them from the city. Tiberius (A. D. 42) founded his hopes of the empire to which he aspired, on the predictions of Thrasyllus, who had been with him during his abode at Rhodes. However he would not repose any confidence in his art till he had put him to a trial in which several had miscarried and fallen victims. Accordingly, one of his freedmen conducted the astrologer through steep and difficult paths to a centry-box fixed on the top of a house, erected on a steep rock close to the sea. If Tiberius suspected fraud or falsity in the predictions of those who practised the art, they were thrown into the sea that beat against the rock on which this house of trial stood. Thrasyllus was conducted to this place, and had the good fortune to please Tiberius, by promising him the empire, and by the ingenious turn he gave to every thing he said. Tiberius asked him, whether he could draw his own horoscope, and whether by comparing the time of his birth with the present state of the heavens, he could tell what he was to meet or hope for at that instant. The astrologer, without doubt apprized of the fate of his predecessors, looked at the stars and shuddered; the more he considered them the more he trembled; and at length exclaimed that he was threatened with great and imminent danger. Tiberius, convinced of his skill by this experiment, embraced him and admitted him into the number of his confidential friends. His answers, when he was consulted, Tiberius regarded as oracular; and he determined to learn the science himself. At Rhodes he had leisure to receive lessons from Thrasyllus, and profited by them to such a degree, that he had the honour in a cumbrous age of having delivered predictions that were verified by the event. Augustus, however (A. D. 111.), revived the ancient law against astrologers; and to express his contempt for their pretended skill, and to show how much he disdained any of their predictions, he published and posted up at Rome the theme of his own nativity, or a state of the position of the stars at the instant of his birth. In the year 16, the old ordinances against astrologers were again revived; two of them were capitally punished, and the rest banished from Italy. But Tiberius, who believed in astrology, and frequently recurred to it, prevented the rigorous execution of the decree; and those who promised to renounce their art were permitted to stay at Rome. The old laws against astrologers were again enforced in the year 52, and the senate passed a very severe decree against them; but these measures were ineffectual to their suppression. In the year 65, Vitellius, though he inclined to credit their predictions, issued an edict against them, commanding them to leave Italy within a limited time; but so great was their confidence at this time in their own security, that they pleaded a placard against his order, and commanded the emperor to leave the world before the day appointed for their banishment. The emperor Domitian, though he firmly believed in their delusive arts, passed an edict by which they were all banished from Rome. His credulity proved an occasion of direful terror to him towards the close of his reign, for an astrologer, called Achitarius, is said to have predicted the day and manner of his death. The emperor Adrian was very much addicted to both astrology and divination; and thus, occasionally protected and encouraged, and sometimes perjured and banished them. The astrologers maintained their influence at Rome to the time of St. Augustin, for the subject of one of his homilies (in Pl. lit. p. 32. ed. Froben. 1556) is the reconciliation of one of these pretended mathematicians with the church. See Genethliaci.

"Tu nequeferis (fere nefis) quem mibi, quem tibi Finem Dii dedereat, Leucōnes, nee Babylonos Tentariis numeros ut meus, quidquid erit, pati." Ast: 145.—"his impious to inquire—what date The limit of your life is fixed by fate; Not vainly Babylonian numbers try, But wisely wait your lot, to live or die."

The Brannus, who introduced and practised this art among the Indians have hereby made themselves the arb.
ASTRONOMICAL Observations. See Observations, Observatory, and Catalogue.

ASTRONOMICAL Place of a star or planet, is its longitude or place in the ecliptic, reckoned from the beginning of Argo, in conjunction, or according to the natural order of the signs.

ASTRONOMICALS, a name used by some writers for sexagesimal fractions, on account of their use in astronomical calculations.

ASTRONOMICUS Radius. See Radius.

ASTRONOMY, formed of στροφή, star, and ἀστήρ, star or ruler, is a mixed mathematical science, which treats of the heavenly bodies, their motions, periods, eclipses, magnitudes, &c. and of the causes on which they depend.

The early history of this science, like that of many other ancient discoveries, is too much disfigured by fabulous and allegorical representations, to admit of any regular or satisfactory elucidation. It is probable, however, that some knowledge of this kind must have been nearly coeval with the human race; for besides motives of mere curiosity, which are sufficient to have excited men in all ages to examine the magnificent and varying canopy of the heavens, it is evident that some parts of the science are so connected with the common concerns of life, as to render the cultivation of them indispensably necessary.

Many traces of it have accordingly been found among various nations, which show that several of the most remarkable celestial phenomena, at least, must have been observed, and a knowledge of them disseminated at a very remote period. But in what age or country the science first originated, or by whom it was gradually methodized and improved, is extremely uncertain; nothing more being known on this subject than what can be obtained from the fealty and incidental information of ancient writers, whole accounts are often too extravagant and improbable to deserve much attention.

Among other relations of this kind, may be reckoned what is mentioned by Josephus in his Antiquities, who, in speaking of the progress that had been made in astronomy by Seth and his posterity, before the deluge, affirms that they engraved the principles of the science on two pillars, one of stone and the other of brick, called the pillars of Seth; and that the former of these was entire in his time. He also ascribes to the Antediluvians a knowledge of the astronomical cycle of 600 years, which Montucla (in his Histoire des Mathematiques) thinks, with much greater reason, was an invention of the Chaldeans; and that whatever information was possessed by the Jewish annalists with respect to this remarkable period, was probably obtained either from that people, or from some ancient writers which no longer subsist.

But not to insist upon this and other uncertain testimonies of the ancients, it will be sufficient to observe that, notwithstanding the contrariety of opinions which have prevailed on this subject, the greater part of authors are agreed in fixing the origin of astronomy either in Chaldaea or in Egypt; both of which nations pretended to a very high antiquity, and equally claimed the honour of producing the first cultivators of this science. The Chaldeans, in particular, boasted of their temple, or prodigiously high tower, of Belus, which is thought by some to have been an astronomical observatory, and of their celebrated philosopher and astronomer Zoroaster, whom they placed 300 years before the destruction of Troy; while the Egyptians, with similar ostentation, vaunted of their colleges of priests, which were the depositories of every species of knowledge; and of the monument of Ozymandias, in which it is said that
there was a golden circle of 365 cubits in circumference, and one cubit thick, divided into 365 equal parts, according to the days of the year, and containing the heliacal risings and settings of the stars for each day, &c. See Heliacal.

It is evident, indeed, without placing much reliance upon those accounts, that both Chaldeans and Egyptians were countries extremely proper for astronomical observations, being almost constantly favoured with a pure atmosphere and a serene sky; and whatever may be thought of the tower of Babel, or the circle of Olympeus, we cannot but form a very advantageous opinion of the knowledge of the Egyptians in practical astronomy, from the position which they have given to their pyramids, whose faces are directed with great precision towards the four cardinal points of the compass. For as it is scarcely possible that a situation so exact, could have been the effect of chance, we must conclude that they were acquainted with a correct method of drawing a meridian line; which is a matter of more difficulty than is usually thought; it being well known that Tycho Brahe, the most able astronomer of his time, committed an error of several minutes in tracing that of his observatory of Uraniborg. See Meridian.

The Chaldeans also must have made very considerable advances in this science, if we can rely upon the testimony of Simplicius, who informs us that, at the taking of Babylon by Alexander the Great, they cited a regular series of astronomical observations for 1303 years back; and that, through the means of Callisthenes, were afterwards communicated to the Greeks by Aristotle. But it is much to be wished that the truth of these ancient observations was better established, particularly as their historian Berossus, who appears to have lived but a little before the time of Alexander, makes no mention of any astronomical monument of this people, which was more than about 480 years anterior to that period. And, indeed, the most ancient Chaldean observations, of which any mention is made by astronomical writers, are those of three eclipses of the moon, employed by Ptolemy in his Almagest, which were made in the years 272 and 28 of the era of Nabonassar, or 721 and 720 years before Christ.

But though Ptolemy, and perhaps Hipparchus, from whom he had probably taken them, made no use of any observations more ancient than those here mentioned, we cannot from thence conclude that the Chaldeans first began to follow the celestial motions at this period. For such as were made in much earlier times might be suspected on several accounts; and it is besides highly probable that most of those which preceded the era of Nabonassar were not accompanied with dates sufficiently accurate to be employed by those astronomers. The Babylonian calendar, before this era, was in great confusion, not having been properly regulated; and it is obvious that ancient observations, either of this, or any similar kind, can be but of little use, except we are able to ascertain the precise time at which they were made.

Besides these eclipses mentioned by Ptolemy, nothing more now remains of the Chaldean astronomy, except what is attributed to them by some ancient authors, with respect to certain periods of years, which they seem to have formed for the more ready computation of the places of the heavenly bodies. And though the accounts which have been given us of one of the most remarkable of these cycles, by Suidas and Pliny, are not wholly free from objections, there can be little doubt of its having been first invented by that people. This is the celebrated period called the Chaldean Saros, which consists of 223 lunar months, or a little more than 18½ years; and which so far agrees with the combined motions of the sun and moon, as always to bring them again into nearly the same position at the end of each cycle that they had at its commencement.

Both the Chaldeans and Egyptians, indeed, are generally supposed to have possessed a very considerable knowledge of several other branches of the science besides those here mentioned; but for want of proper authorities, this can only be judged of by some few notions which they appear to have had of the system of the world, and by the agreement which has been found among several ancient authors, concerning the circumference of the earth. The Egyptians, in particular, appear to have known, long before the Christian era, that the year consisted of 365½ days, and that the planets Mercury and Venus moved round the sun. We are also well assured of the great antiquity of the science among this people, from the recent discoveries which have been made in that country during the late war; and particularly from the figure of a zodiac brought from thence by the French, which Lalande considers as extremely ancient. But among the various nations which claim the honour of having first cultivated this science, none pretend to possess observations of greater antiquity than the Chinese. The most remarkable of these is a conjunction of five of the planets, which, according to their annals, is said to have taken place in the reign of the emperor Tchung-hu, about 2300 years before Christ. They also mention an eclipse of the sun, which happened in the constellation Scorpio, about the year 1950 of the same era; and which is said to have proved fatal to two Chinese astronomers of the names of Ho and Hi, who were condemned to death by the emperor Tchong-kang, on account of their omitting, through negligence and intoxication, to announce the precise time at which it arrived. And from these data, apparently well attested, several eminent astronomers have endeavoured to discover whether these events could have possibly happened about the time here mentioned; but the subject is attended with too many difficulties to afford any satisfactory result.

All that we know of the Chinese astronomy is from the accounts which have been given of it by the Jesuit missionaries, who are much divided in their opinions with respect to its very great antiquity; some supposing it to have flourished at a more earlier period than others. V. De Halde, however, affirms, that it was cultivated by their great lawgiver Confucius; and that Tcheou-cong, the most skilful astronomer that China ever produced, lived more than 1000 years before Christ, and passed whole nights in observing the celestial bodies, and arranging them into constellations. But whatever might have been the knowledge of this people in former times, the state of astronomy is very low in that country at present, although it is cultivated at Peking by public authority, in the same manner as in most of the capital cities of Europe.

The inhabitants of Japan, Siam, and the Mogul's empire, also appear to have been acquainted with astronomy from time immemorial; and the famous observatory at Senares (see Observatory) is a monument both of the great ingenuity of the Indians, and of their skill in that science. A knowledge of this subject is also supposed to have prevailed among the Americans; though, in their divisions of time, they made use of the solar and not of the lunar motions. The Mexicans, in particular, are said to have discovered a singular predilection for the number 13, which they used as a kind of cycle in most of their computations. And the abbe Clavigero asserts it as a remarkable fact, that having discovered the excess of a few hours in the solar above the lunar year, they made use of intercalary days to bring them to an equality, as was done by Julius Cæsar.
the Roman calendar; but with this difference, that, instead of one day every four years, they interpolated 13 days every 52 years, which produces the same effect.

But the most interesting account of the rise and progress of this science hitherto given is that which is detailed by M. Bailly, in his learned and elaborate history of Ancient and Modern Astronomy; in which he endeavors to trace its origin among the Chaldæans, Egyptians, Persians, Indians, and Chinese, to a very early period. And in consequence of the researches he has made on this subject, he is led to maintain, that the knowledge common to the whole of those nations, has been derived from the same original source; namely, a most ancient and highly-cultivated people of Asia, of whose memory every trace is now extinct; but who have been the parent-instructors of all around them.

M. Bailly does not pretend to fix, with certainty, the precise situation of this ancient people; but he offers several reasons for conjecturing that it must have been somewhere around the 49th or 50th degree of north latitude, in the southern region of Siberia. Among various other coincidences, he observes, that many of the European and Asiatic nations attribute their origin to that quarter, where the civil and religious rites, common to each, were probably first formed; and what he considers as a strong astronomical support of his hypothesis is, that the observations of the stars, collected by Ptolemy, must have been made in a climate where the longest day was 16 hours, which corresponds to the latitude here mentioned. But as that region exhibits no traces of its ever having been inhabited by a polished people, his theory, though highly ingenious, has not sufficient force to draw our assent to his conclusions.

In investigating the antiquity and progress of astronomy among the Indians, M. Bailly examines and compares four different sets of astronomical tables of the Indian philosophers, viz. that of the Siamese, explained by M. Cañini, in 1689; that brought from India by M. de Gentil of the Academy of Sciences; and two other manuscript tables found among the papers of the late M. de Lifle; which, he observes, accord together, and all refer to the meridian of Benares. From these tables it appears, that the Indian astronomy has two principal epochs, the first being founded on a conjunction of the sun, moon, and planets, which is said to have taken place 3102 years before Christ; and the other 1491 years before the same era. These periods are so connected by the mean motions of the sun, moon, and planets, that one of them must necessarily be fictitious; and though the celebrated author above mentioned, has endeavored to show that the first of them must have been founded on observations, there is great reason for believing that it was rather imagined for the purpose of giving a common origin to the signs of the zodiac, and the motions of the celestial bodies.

It is true, indeed, if, partsing from the epoch 1491, we ascend, by means of the Indian tables to the year 3102, before the Christian era, we shall find a general conjunction of the sun, moon, and planets, as these tables suppose; but this conjunction, which is too different from the result given by the best modern tables to have ever taken place, shows that the epoch to which they refer, is not founded upon observations; and, in fact, some elements of the Indian astronomy, seem to indicate that they were determined even long before this first epoch. The equation of the sun's centre, in particular, which they fix at 2° 16' 57", could not, according to the calculations of M. de La Place, have been of this magnitude but near the year 4300 before Christ; and besides this, the equations of the centre of Jupiter and Mars are so different from what they ought to have been at this epoch, that nothing can be concluded from them in favour of their high antiquity. But to conclude, the whole of these tables, and, above all, the conjunction which they suppose at the same epoch, prove, on the contrary, that they must have been constructed, or at least revised, in much more modern times. The ancient reputation, however, of the Indians, both in this and other sciences, leaves but little doubt, that astronomy was cultivated among them at a very remote period; and of this, the remarkable accuracy with which they have aligned the mean motions of the sun and moon, are sufficient proofs, as such exactitude could only have been obtained from a long series of observations. This opinion has also been ably supported by Mr. Playfair, in a dissertation on the astronomy of the Brains, published in the second volume of the Transactions of the Royal Society of Edinburgh, where he has, likewise, adduced many influences of their critical knowledge in the other mathematical sciences, employed in their precepts and calculations.

The Greeks did not begin to cultivate astronomy till a long time after the Egyptians, of whom they were the disciples; and it is extremely difficult, amidst the fables which so much abound in the earlier periods of their history, to obtain any very correct information with respect to their knowledge in this science. All that we can learn is, that they had made observations on the celestial bodies, and divided the heavens into constellations, 13 or 14 centuries before the Christian era; this being the period, according to the opinion of the most eminent chronologer, to which we must refer the sphere of Eudoxus.

The number of their philosophical institutions, however, afford no observer of any note, till much later times; most of their ancient sects having treated astronomy as a science purely speculative, without properly attending either to facts, or their causes. But notwithstanding the reverses in which they often indulged, their knowledge began to be greatly improved by Thales the Miletian, and other Greeks who travelled into Egypt, and brought from thence the chief principles of the science. This philosopher, who died at the age of 96 in the year 548 before Christ, was the founder of the Ionian sect, and appears to have been the first who taught his countrymen the globular figure of the earth, the obliquity of the ecliptic, and the causes of solar and lunar eclipses; which latter phenomena he is also said to have been able to predict.

Thales had his successors Anaximander, Anaximenes, and Anaxagoras, to the first of whom is attributed the invention of the gnomon, and geographical chart; but for which he was probably indebted to the Egyptians. He is also said to have maintained that the sun was a mass of fire as large as the earth, which, though far below the truth with respect to size, was an opinion, for those early times, that does not author much credit; though to him, as in the case of Galileo, the truths he had discovered were the cause of his persecution. Both himself and his children were perished by the Athenians, for his attempting to subject the works of the gods to immutable laws; and his life would have paid the sacrifice of his temerity, but for the care of Pericles, his friend and disciple, who, got his sentence of death changed into exile.

Next after the Iolant school was that of Pythagoras, who was born at Samos, about the year 586 before the Christian era, and who, in the celebrity he acquired, far exceeded his predecessors. Like Thales he visited Egypt, and afterwards the Brachmans of India, from whom he is supposed to have obtained many of the astronomical truths which
Astronomy.

which he brought with him into Italy, to which country he was obliged to retire on account of the deposition which then prevailed at Athens. Here he taught the true system of the world, which, many centuries after, was revived by Copernicus; but hid his doctrine from the vulgar, in imitation of the Egyptian priests who had been his instructors. It was even thought, in this school, that the planets were inhabited bodies, like the earth; and that the stars, which are intercalated through infinite space, are funs, and the centres of other planetary systems. They also confided the comets as permanent bodies, moving round the sun; and not as undefined meteoric bodies, formed in the atmosphere, as they were thought to be in after times.

From this time to the foundation of the school of Alexandria, the history of astronomy among the Greeks offers nothing remarkable, except some attempts of Eudoxus to explain the celestial phenomena; and the celebrated cycle of 19 years, which had been imagined by Meton, in order to conciliate the solar and lunar motions. This is the most accurate period, for a short interval of time, that could have been devised for embracing an exact number of revolutions of these two luminaries; and is so simple and useful, that, when Meton proposed it to the Greeks, assembled at the Olympic games, as the basis of their calendar, it was received with great approbation, and unanimously adopted by all their colonies.

In the school of Alexandria, we see, for the first time, a combined system of observations, made with instruments proper for measuring angles, and calculated trigonometrically. Astronomy, accordingly, took a new form, which succeeding ages have only brought to greater perfection. The position of the stars began at this time to be determined; they traced the course of the planets with greater care; and the inequalities of the solar and lunar motions became better known. It was, in short, in this celebrated school, that a new system of astronomy arose, which embraced the whole of the celestial motions; and though inferior to that of Pythagoras, and even falser in theory, it afforded the means, by the numerous observations which it furnished, of detecting its own falsity, and of enabling astronomers in later times to discover the true system of nature.

Arilittus and Timocleatus were the first observers in this rising institution. They flourished about the year 260 before Christ; and by their assiduous labours, were the means of greatly improving this science. It was from their observations of the principal zodiacal stars, that Hipparchus, who had led to discover the precession of the equinoxes, and Ptolemy also founded upon them their theory of the motions of the planets.

Next after these, was Arilittus of Samos, who made the most delicate elements of the science; the objects of his research Among other things of this kind, he attempted to determine the magnitude and distance of the sun; and though, as may be supposed, the results he obtained were considerably wide of the truth, the method he employed to resolve these difficult problems, do great honour to his genius. He also endeavoured to revive the opinion of the Pythagorean school, with respect to the motion of the earth; but as his writings upon this subject have not been preserved, we are ignorant as to what point he had advanced, by this means, in the exposition of the celestial phenomena.

The celebrity of his successor Eratosthenes, and chiefly from his attempt to measure the earth, and his observations on the obliquity of the ecliptic. Having remarked at Syene, a well which was enlightened by the fun, on the day of the summer solstice, he observed the meridian height of the sun on the same day at Alexandria; and found that the celestial arc, contained between the two places, was the 50th part of the whole circumference; and as their distance was estimated at 500 miles, he fixed the length of a great circle of the earth at 250,000; but as the length of the stadium is not known, we cannot appreciate the exactness of his measurement.

Among others who cultivated and improved this science, we may also mention the celebrated Archimedes, who constructed a kind of planetarium or orrery, for representing the principal phenomena of the heavenly bodies. But of all the astronomers of antiquity, Hipparchus of Byzantium is the one, who, by the number and precision of his observations, as well as by the important results which he derived from them, is the most entitled to our esteem. He flourished at Alexandria about the year 162 before the Christian era; and began his astronomical labours by attempting to determine, with more exactness than had hitherto been done, the length of the tropical year, which he fixed at 365 days, 5 hours, and 55 minutes, being near 4 minutes too great. Like most of his predecessors, he founded his system upon a uniform circular motion of the sun; but instead of placing the earth in the centre of the solar orbit, he removed it to the distance of 1/3 of the radius, and fixed the apogee to the sixth degree of Gemini. By means of these data, he formed the first solar tables of which any mention is made in the history of astronomy; and though defective and even erroneous in principle, they are a durable monument of his genius, which three centuries afterwards were respected by Ptolemy, without his presuming to alter them.

The great astronomer next considered the motions of the moon, and endeavoured to measure the exact time of her revolution, by a comparison of ancient eclipses. He also determined the eccentricity and inclination of her orbit, as well as the motion of her nodes and apogee; and calculated all the eclipses that were to happen for 600 years to come. We are, besides, indebted to him for the important discovery of the precession of the equinoxes (see Precessions), which was the fruit of the long and difficult enterprise he undertook of making a catalogue of the fixed stars, with their latitudes, longitudes, and apparent magnitude. Geography is also indebted to Hipparchus for the method of fixing the situation of places upon the earth, by means of their latitude and longitude; in obtaining the latter of which, he appears to have been the first who employed eclipses of the moon; and as these researches required numerous calculations, they gave birth, under his hands, to spherical trigonometry. Many of his principal works perished with the library of Alexandria; but his catalogue of the stars, and several of his observations, have been preserved by Ptolemy in his Almagest.

Between the time of Hipparchus and Ptolemy, the chief observers of any note were Agrippa, Menelaus, and Theon; the two latter of which are better known as geometerians than astronomers. We remark, however, in this interval, the reformation of the calendar by Julian Cæsar, and a more exact knowledge of the flux and reflux of the ocean (see Tides). Ptolemaeus, a celebrated Greek philosopher, who lived about eighty years before Cæsar, appears to have been the first who observed the relation of these phenomena with the motions of the moon; and of which Phryn, the naturalist, has given a description, remarkable for its accuracy.

Ptolemy, the worthy successor of Hipparchus, was born at
Astronomy.

at Pelusium in Egypt, in the beginning of the second century of Christianity, and was the first who undertook to reform the whole of this science, by establishing it upon a new foundation. In this enterprise, the system he formed is now well known to be erroneous, but the three he erected lasted near 1400 years; and even at this time, though it is entirely destroyed, his Almagest, considered as the depository of ancient observations, is one of the most precious monuments of antiquity. See Almagest.

One of the most important discoveries of this astronomer is that of the evolvement of the moon (see Evolvement), which he has affixed with so much exactness, that M. La Place, in opposition to the opinion of other writers, thinks it sufficient to entitle him to the character of an accurate observer; and that the charge which has been made against him, of appropriating the discoveries of his predecessors, is not well founded.

It may also be remarked, that Ptolemy has rendered great services to geography, by collecting all the determinations of the latitudes and longitudes of places then known; and by his laying the foundation of the method of projections, for the construction of geographical charts, which was but little known before his time. In short, the various works which he executed, upon a variety of subjects, are strong proofs of a great and enlightened mind, and will always infuse him a distinguished rank in the history of the sciences.

With the labours of this great astronomer ended the glory of the Alexandrian school, which had now laboured for more than five centuries, with as much credit to itself as advantage to the sciences; but the successors of Hipparchus and Ptolemy, contented themselves with commenting on their works, without adding anything remarkable to their discoveries. The knowledge of nature, which had hitherto been cultivated with so much success, gave way to the defolating irruption of the Saracens, who were led by a ferocious zeal to destroy the celebrated library of Alexandria, which contained so many treasures of learning and genius. By a singular turn, however, of human affairs, this people became afterwards the protectors and cultivators of literature and science, and were then sensible, that this frantic measure had deprived them of the most precious fruits of their victories.

The caliph Almanfâr first introduced a table for the sciences into his empire; and his grandson, Ahammad, who ascended the throne in 815, was a great encourager and improver of astronomy. Having constructed proper instruments, he made many accurate observations; and, among others, determined the obliquity of the ecliptic to be 23° 35'. Under his auspices also, a degree of the meridian was measured, a fecond time, in the plains of Singar, on the borders of the Red Sea. About the same time, or at a short time later period, Alfraganus likewise wrote a tractate on astronomy; and hence the science began to be greatly cultivated by the Arabsians; particularly by Alfraganius, who gave a new and improved theory of the sun, from which he derived results that are much valued for their accuracy; and above all, as they directly confirm the diminution of the eccentricity of the polar orbit, as since demonstrated by the theory of gravity, and by the secular equation of the moon. His work, intitled "The Science of the Stars," is still extant, and was long esteemed by the Arabsians. But after his time, though the Saracens had many eminent astronomers, several centuries elapsed without producing any very valuable observations, excepting those of some eclipses, observed by Ibn Junis, astronomer to the caliph of Egypt, which serve to show the acceleration of the mean motion of the moon.

The Persians, who for a long time were of the same religion, and subjected to the same sovereigns with the Arabs, began about the middle of the eleventh century, to throw off the yoke of the caliphs; and at this period, their calendar received, by the care of their astronomer Omar Cheyan, a new form, founded upon an ingenious intercalation, which confided in making eight biquinque-years at the end of every thirty-three common years. See Bissextile. About the same time, also, Hayagan Ilseskan, one of their sovereigns, assembled the most considerable astronomers at Maraghâ, where he constructed a magnificent observatory, the care of which was confided to Nasir-Eddin. But of all the princes of this nation, the one who distinguished himself the most, by his zeal for astronomy, was Ulugh Beigh, a grand-son of the celebrated Tamerlane, who was a great proficient in this science. He formed, from his own observations, at Samarcand, the capital of his empire, a new catalogue of the stars, and the belt tables of the sun and planets that had been given before those of Tycho Brahe. He also determined, in 1437, with a quadrant 180 feet high, the obliquity of the ecliptic, which he found equal to 23° 31' 57''.

During this period, the greatest part of Europe was immered in ignorance and barbarity; which would have probably continued much longer, but for the settlement of the Moors in Spain, who first introduced a taste for literature and the sciences into this part of the world. The Arabs by this means became our instructors, as the Egyptians had been formerly of the Greeks; and, by a singular fatality, the learning which they transmitted to us, has disappeared among this people, as astronomy became neglected in the temples of Egypt and Chaldea, in proportion to the progress which it made in the school of Alexandria.

One of the first encouragers of learning in Europe was Frederick II., who, about 1230, set about reforming the decayed universities, and founded a new one at Vienna. He also caused the works of Aristotle and Ptolemy's Almagest, to be translated into Latin; from which latter circumstance we may date the revival of astronomy in Europe. Two years after this, John of Halifax, commonly known by the name of Sacro Bofco, compiled from Ptolemy, Alfraganus, Alfraganus, and other Arabic astronomers, his work "De Sphaera," which continued in great estimation for more than 300 years afterwards, and was honoured with commentaries by Clavius and other learned men. Alphonus, king of Castile, may also be reckoned as one of the most zealous encouragers and protectors of this science; though only, but ill succeeded by the astronomers of that time, the tables which he published were not found to answer the great expectation which attended them.

About the same period also Roger Bacon, an English monk, besides many learned works of various kinds, wrote several tracts on astronomy; after which but little progress was made in this science till the time of Purbach, Regiomontanus, and Walther, who all flourished about the middle of the fiveh century, and by their labours prepared the way for the great discoveries which followed. Regiomontanus, in particular, who was born at Königsberg, a town of Prussia, in 1436, and whose proper name was John Muller, rendered considerable services to astronomy, not only by his observations and writings, but by his trigonometrical tables of sines and tangents, which he computed to a radius of 14,000,000 for every minute of the quadrant, and by this means greatly facilitated astronomical computations, which had now become both numerous and intricate. John Werner, who succeeded Walther as astronomer at Nuremberg, is also deserving of notice, as being the first who proposed the method of finding the longitude
Longitude at sea by observing the moon's distance from the sun and certain fixed stars, which is now so successfully practised in the British navy.

Next after these was Nicholas Copernicus, the celebrated refixer of the old Pythagorean system of the world, which had been now set aside ever since the time of Ptolemy. He was born at Thorn, in Pomerania, in 1473, and having gone through a regular course of studies at Cracow, and afterwards at Rome, he was made by the intered of his uncle, who was bishop of Worma, a canon of Frankenberg; in which peaceful retreat, after 36 years of observations and meditations, he establisht his theory of the motion of the earth, with such new and demonstrative arguments in its favour, that it has gradually prevailed from that time, and is now universally received by the learned throughout Europe.

This great man, however, had not the satisfaction of witnessing the success of his undertaking, being threatened by the persecution of religious bigots on the one side, and with an obstinate and violent opposition from those who called themselves philosophers on the other: it was not without the greatest solicitations that he could be prevailed upon to give up his papers to his friends, with permission to make them public; but from continued importunities of this kind, he at length complied, and his book, "De Revolutionibus Orbium Coelestium," after being suppressed for many years, was at length published, and a copy of it brought to him a few hours before his death. His disciple Rheticus, who has rendered great services to the mathematical sciences by his extensive tables of sines, tangents, and secants, to every ten seconds, was the first who adopted his ideas; but they made but little progress till towards the beginning of the 17th century.

In this interval, however, the science was not wholly neglected. Nonius in particular wrote several valuable treatises on Astronomy and Navigation, and invented some useful instruments, more accurate than those before known; one of these being the almanac quadrant, on which he divided the degrees into minutes, by a number of concentric circles. Apian also, in 1530, wrote a book called the "Caifaricum Almanach," in which he shows how to observe the places of the stars and planets by the astrolabe; to resolve astronomical problems by means of certain inframes, and to predict and calculate eclipses; and at the end of his work are added observations of five comets, one of which has been supposed to be the same with that described by Hevelius; and whose return was accordingly looked for in the year 1789, but it did not appear. Gemma Frisius, who lived about this time, is likewise deserving of notice, as being the first who recommended timekeepers for finding the longitude at sea. See Chronometre.

The history of the science, about this epoch, also offers us a great number of excellent practical astronomers; one of the most illustrious of whom was William IV. Landgrave of Hesse-Cassel, who built an observatory in that city, and furnished it with a number of the best instruments that could be obtained at that time, with which he made his own observations. He also attached to himself the celebrated astronomers Rothman, and Julius Byrgius, and with their help formed a catalogue of 100 stars with their latitudes and longitudes, adapted to the beginning of the year 1593. It was also from his prefixing solicitations, that Tycho Brahe, one of the greatest observers that ever existed, procured the advantages that he enjoyed under Frederic II. king of Denmark.

This excellent Danish astronomer, who was born at Knudstrup in the county of Schonen, in 1546, began to mani-

feit his taste for this science at the early age of 14. An eclipse of the sun which happened in 1560, first attracted his attention; and the juncture of the calculation which announced this phenomenon, inspired him with a strong desire of understanding the principles upon which it was founded. But meeting with some opposition from his tutor, and a part of his family, to these pursuits, which probably served only to increase his attachment to them, he made a journey into Germany, where he formed connections, and entered into a correspondence with some of the most eminent astronomers of that country, particularly with the landgrave of Helf, who received him in the most flattering manner, and recommended him to the notice of his sovereign. Becoming by this means better known, on his return to Denmark, Frederic II. gave him the little island of Hven, at the entrance of the Baltic, where he built an observatory, under the name of Uraniborg, and in which, during a course of twenty years, he made a prodigious number of observations.

His tranquility, however, in this happy retreat, was, at length, interrupted; for soon after the death of Frederic, which happened in 1596, he was deprived, through the attercisions of some envious and malevolent persons, of his pension and establishment, and was not even allowed to follow his pursuits at Copenhagen; a misfortune of that time, of the name of Wallendorp, having forbidden him to continue his observations. Happily, however, he found a powerful protector in the emperor Rodolph II., who ordered him to be properly provided for at his own expense, and gave him a commodious house at Prague. After residing in this city till the year 1601, he was taken off by a sudden death, in the midst of his labours, and at an age while he was yet capable of rendering great services to astronomy.

This great man, as is well known, was the inventor of a kind of Semi-Ptolemaic system of astronomy, that was afterwards called by his name, and which he vainly endeavoured to establish instead of the Copernican or true system. But though he was not happy in this respect, he has been of great use to astronomy by his numerous observations and discoveries. Among other things he was well acquainted with the nature of refractions (see Refraction); and hence he was able to determine the places of a great number of the fixed stars, with an accuracy unknown to former times. He also proved, against the opinion which then prevailed, that the comets are higher than the moon (see Comet); and from his observations on this and the rest of the planets, the theories of their motions were afterwards corrected and improved, so that for these services he will always be celebrated and esteemed by astronomers.

Tycho Brahe, in the latter part of his life, had for his disciple and assistant the celebrated Kepler, who was born in 1571, at Wiel, in the duchy of Wirtemberg, and was one of those rare characters that appear in the world only at particular times, to prepare the way for new and important discoveries. Like his master Tycho, he appears to have attached himself to the science at a very early age; and if it be the privilege of genius to change received ideas, and to announce truths which had never before been discovered, he may justly be considered as one of the greatest men that had yet appeared. Hipparchus, Ptolemy, Tycho Brahe, and even Copernicus himself, were indebted for a great part of their knowledge to the Egyptians, Chaldæans, and Indians, who were their masters in this science; but Kepler, by his own talents and industry, has made discoveries of which no traces are to be found in the annals of antiquity.

The philosopher, the most useful to the sciences, is one who to a profound imagination unites a scrupulous judgment, and
and throughly deserve to elevate himself to the caste of the philosophers, is equally apprehensive that he may be mistaken in that which he affirms to them. Kepler owed to

At Newton's patronage, and grafted him with the help of Tycho Brahe, who perceived his genius, and advised him to abandon his attachment to the mysterious analogies of figures and numbers to which he was then addicted, and to attend more closely to facts and their consequences. This appears to have had itsproper effect, and Tycho dying a few years afterwards, Kepler was put in possession of his collection of observations, which he employed to the most useful purposes, having founded upon them three of the most important discoveries that have ever been made in natural philosophy.

It was an opposition of Mars, which determined him to occupy himself, in preference, upon the motion of this planet; and being thus strongly attached to the Ptolemaic system as modified by Tycho Brahe, as well as to the opinion which had hitherto been generally received, that all the celestial motions must be perfectly circular and uniform, he endeavoured, for a long time, to represent those of Mars according to this hypothesis. At length, however, after many trials of this kind which he has given in detail, in his treatise called "Stella Martis," he discovered that the orbit of Mars is an ellipse of which the sun is placed in one of the foci, and that the planet moves in it in such a manner, that the radius vector, or line drawn from the centre of the sun to that of the planet, describes areas proportional to the times.

This law he also soon afterwards extended to all the planets; and in 1626, he published, according to this theory, his Rudolphine tables, which will be for ever memorable in astronomy, as being the first that were founded on the true laws of the planetary motions.

It is here worthy of remark, that without the speculations of the Greek mathematicians, upon the curves formed by the sections of a cone, it is highly probable that we should yet have remained ignorant of some of the most curious and important laws of nature. The ellipse being one of these curves, its lengthened figure suggested to the mind of Kepler the idea that the planet Mars, whose orbit he had found to be more oval than circular, might possibly move in it; and soon after, by means of the numerous properties which the ancient geometers had discovered of the conic sections, he ascribed himself of the truth of this hypothesis. The history of the sciences affords many examples of the kind of application of pure geometry, and of the advantages attending it; for every thing, in the immense chain of truths, is connected, and frequently a single observation of apparently trifling consequence, has led to a more intimate knowledge of nature, of which the phenomena are the mathematical results of a small number of invariable laws.

The perception of this truth was probably what first gave rise to the mysterious analogies of the Pythagoreans; and Kepler, who had indulged himself in researches of this kind, was indebted to it for one of his most brilliant discoveries. Being persuaded that the mean distances of the planets from the sun ought to be conformable to these analogies, he compared them, for a long time, both with the properties of the five regular bodies, and with the notes of music. At length, after seventeen years of meditation and calculation, having had the idea of comparing them with the powers of the numbers by which they are expressed, he found that the squares of the times of the revolutions of the planets are to each other as the cubes of their mean distances from the sun; and that the same law applies equally to their satellites.

Astronomy is likewise indebted to Kepler for several other discoveries; which, though not equal to the former, are fill of considerable importance. He believed that it was the attraction of the moon which caused the flux and reflux of the ocean; and he had so far an insight into the general law of gravitation, as to suspect, that the irregularities of the lunar motions were occasioned by the combined actions of the earth and the sun. In his work on Optics, he has also explained the mechanism of vision, which was before unknown; and in another performance, called "Stereometria Doliorum," he has presented several views on the nature of infinites, which had considerable influence on the revolution that geometry underwent about the end of the last century.

It is affixing to relate, that this great man, who may be considered as the founder of modern astronomy, led his last days embittered by the horrors of poverty and distress. A small pension, which was scarcely sufficient for his subsistence, was frequently withheld or unpaid; and the trouble and vexation which this occasioned him, obscured his genius, and shortened his existence. He died on the 15th of November 1631, in the fifty-ninth year of his age, leaving nothing for his wife and family, but the glory of his name, and the fame he had so justly acquired; but as there were insufficient to relieve his own wants, they could afford only comfort to a helpless wife, and her wretched offspring, whose indigence is said to have been such that they had not even the common necessaries of life.

In the time of Kepler, there were not wanting several other considerable benefactors in astronomy. Edward Wright, an Englishman, made several good meridian observations of the sun, with a quadrant of six feet radius, in the years 1594, 1595, and 1596, from which he improved the theory of the sun's motion, and computed his declination more accurately than had been done before. He also published, in 1599, an excellent work, entitled, "Certain Errors in Navigation discovered and detected," containing a new method of projecting maps and charts, which has commonly, though erroneously, been ascribed to Mercator. The science is also greatly indebted to baron Napier of Scotland, not only for his ever memorable invention of logarithms, which has so wonderfully facilitated the business of calculation, but for some excellent theorems and improvements in spherics. About this time, likewise, Bayer, a German, published his "Uranometria," or complete Celestial Atlas, containing the figures of all the constellations visible in Europe; into which he introduced the highly useful invention of marking the stars by their names, or the letters of the Greek alphabet, which renders them so easy to be referred to with distinctness and precision.

At the same time also, that Kepler, in Germany, was tracing the orbits of the planets, and settling the laws of their motions, Galileo (who was born at Pisa, in Italy, in 1564) was meditating upon the doctrine of motion in general, and investigating its principles; and from the admirable discoveries which he made in this branch of the phyleo-mechanical sciences, Newton and Huygens were afterwards enabled to derive the most brilliant and complete theories of all the planetary motions. About this period also, a fortunate accident produced the most marvellous instrument that human industry and sagacity could have ever hoped to diffuse; and which, by giving a far greater extension and precision to astronomical observations, showed many irregularities and new phenomena, which had hitherto remained unknown.

This invention was that of the telescope, which was no sooner known to Galileo, than he set himself to improve it; and the discoveries he was by this means enabled to make, were as new as they were surprising. The face of the moon appeared full of cavities and asperities, resembling valleys
Astronomy by his numerous and immense labours; few observers having ever existed who were more indefatigable. It is to be lamented, however, that he refused to make use of instruments with telescopic sights, an invention introduced about that time by the celebrated Dr. Hook, and which gave a precision to observations unknown to former astronomers. He even contested their utility, and a warm dispute having arisen between him and Dr. Hook upon this subject, Dr. Halley, then a young man rising fast into fame and eminence, was lent to examine his instruments, which were found to be excellent of their kind. The two astronomers made several observations together, much to their satisfaction; and among them was one of an occultation of Jupiter by the moon, by which they determined the diameter of the latter to be 30' 33".

About this epoch, astronomy began to be more generally cultivated and improved, in consequence of the establishment of several learned societies, which, by exciting a spirit of emulation and enterprise among their members, greatly contributed to the advancement of every branch of the mathematical and physical sciences. The chief of these were the Royal Society of London, and that of the Academy of Sciences of Paris; both of which have rendered great services to astronomy, as well by the eminent men they have produced, as by the zeal and ardour with which the science has constantly been promoted by them. One of the first effects produced by these establishments, was the great improvement of telescopes and other instruments, which had hitherto been too much neglected for want of proper encouragement.

Huygens constructed a telescope of 123 feet, with which he long observed the moon and planets, and was the first that discovered Saturn's ring. The celebrated Cassini also employed instruments of this kind, of 200 and 300 feet focus, with which he saw the five satellites of Saturn, with his zones or belts, as well as the shadows of Jupiter's satellites passing over his body.

The length of refracting telescopes, however, was still a great inconvenience; to remedy which, as well as the great aberration of their rays, Merlenuis is said to have first startled the idea of making telescopes with reflectors, instead of lenses, in a letter to Descartes; and in 1665, James Gregory of Aberdeen, showed how such an instrument might be constructed. Newton, also, after spending some time on the construction of both these sorts of telescopes, discovered the great inconvenience which arises to refractors from the different refrangibility of the rays of light, and therefore pursuing the other kind, he proceeded in the year 1672, to the Royal Society, two reflectors, with spherical specula, as he could not then contrive the means of giving them a parabolic figure. It is proper to observe, however, that the defects of refracting telescopes, arising from the different refrangibility of the rays of light, have since been completely obviated by the ingenious Mr. Dollond. See Achromatic Telescope.

Towards the latter part of the seventeenth century, and the beginning of the eighteenth, practical astronomy seems rather to have languished; but at the same time, the theoretical part was carried to the highest degree of perfection, by the immortal Newton in his "Principia," and by the astronomy of David Gregory. (See Newtonian Philosophy.)

About this time also, clock and watch-work was greatly improved by Mr. Graham, who likewise constructed the old eight feet mural arch at the Royal Observatory at Greenwich, and the zenith-sector of twenty-four feet radius, with which Dr. Bradley discovered the fixed stars. (See Aberration.) The reflecting telescope of Gregory and Newton, was also greatly improved by Mr. Hadley;
Hadley; but who is still better known for his admirable invention of the reflecting quadrant or sector, now called by his name, and which is universally used at sea, and in all nice observations. Mr. Bird also, about the middle of the eighteenth century, rendered great service to astronomy, by his method of constructing and dividing large astronomical instruments; which has since been carried to the greatest degree of perfection by that admirable artist Mr. John Ramden, whose recent death will be long regretted by astronomers and men of science in general. Reflecting telescopes were likewise not less improved by Mr. Short, who also first executed the divided object-glass micrometer, which had been proposed and described by M. Lousville and others.

Thus the astronomical improvements in the last century, have been chiefly owing to the greater perfection of instruments, and to the establishment of regular observatories in various parts of Europe. Roemer, a celebrated Dutch astronomer, first made use of a meridian telescope; and by observing the eclipses of Jupiter's satellites, he was led to his discovery of the motion of light, which he communicated to the Academy of Sciences at Paris, in 1675. Mr. Flamsteed was also appointed the first astronomer royal at Greenwich, about the same time, where he observed all the celestial phenomena for more than forty-four years; and as the fruits of his labours, published a catalogue of 3200 stars, with their places, to the year 1688, as also new solar tables, and a theory of the moon according to Horrox. Cassini, also, the first French astronomer royal, greatly distinguished himself by his numerous observations on the sun, moon, and planets, and by the improvements he made in the elements of their motions.

In 1719, Mr. Flamsteed was succeeded by Dr. Halley, the friend of Newton, and a man of the first eminence in all the departments of literature and science; who had been sent at the early age of twenty-one, to the island of St. Helena, to observe the southern stars, a catalogue of which he published in 1679; and a few years afterwards he gave to the public, his "Synopsis Astronomica Comitium," in which he ventured to predict the return of a comet in 1758, or 1759. He was the first who discovered the acceleration of the moon's mean motion; and is the author of a very ingenious method for finding her parallax, by three observed places of a solar eclipse; he also showed the use that might be made of the approaching transit of Venus, in 1761, in determining the distance of the sun from the earth; and recommended the method of determining the longitude by the moon's distance from the sun and certain fixed stars, which has since been carried into execution at the instance of the present astronomer royal. Dr. Halley also composed tables of the sun, moon, and planets, with which he compared the observations he made of the moon at Greenwich, amounting to near 1500, and noticed the differences. About this time, an attempt was made in France to measure a degree of the earth, which was the occasion of a warm dispute concerning its figure. M. Cassini concluded, from the measurement of Picart, that it was an oblong spheroid; but Newton, from a consideration of the laws of gravity, and the diurnal motion of the earth, had determined its figure to be that of an oblate spheroid, flattened at the poles, and protuberant at the equator. To determine this point, Louis XV. ordered two degrees of the meridian to be measured, one under or near the equator; and the other as near as possible to the pole, the result of which arduous undertaking was a confirmation of Newton's investigation. Meff. Maupertuis, Clairaut, &c. were employed on the northern expedition; and Condamine, Bouger, Don Uloa of Spain, &c. on the southern; who all fulfilled their commissions with great credit to themselves, and advantage to the sciences, making many observations besides those immediately connected with this subject. Among others, it was found, by those who went to the south, that the attraction of the great mountains of Peru had a sensible effect on the plumb-lines of their large instruments, which afforded an experimental proof of the Newtonian doctrine of gravitation, that has since been completely verified by the observations of Dr. Maskelyne, made on the mountain Schehalliun in Scotland. See Attraction of Mountains.

On the death of Dr. Halley, in 1742, he was succeeded by Dr. Bradley, who has rendered himself highly celebrated by two of the finest discoveries that have ever been made in astronomy, the aberration of light and the rotation of the earth's axis. Among other things, he also formed new and accurate tables of the motions of Jupiter's satellites, as well as the most correct table of refractions yet extant. Also, with a large transit instrument, and a new mural quadrant of eight feet radius, constructed by Bird, in 1750, he made an immense number of observations, for settling the places of all the stars in the British catalogue, together with near 560 places of the moon, the greater part of which he compared with Mayer's tables.

Dr. Bradley was succeeded in 1762, in his office of astronomer royal, by Mr. Bifis, but who, being in a declining state of health, died in 1765; and was succeeded by Nevil Maskelyne, D.D., the present astronomer royal, who has rendered considerable services to this science, by his publication of the "Nautical Almanac," the "Requisite Tables," &c. and more particularly by the great industry and zeal he has displayed in bringing the lunar method of determining the longitude at sea into general practice. In the mean time, many other eminent mathematicians, both of our own, and other countries, were assiduously employed in endeavouring to promote the science of astronomy. The theory of the moon was particularly considered by Mess. Clairaut, d'Alembert, Euler, Simpon, Wulffsen, and Mayer; the latter of whom computed a set of lunar tables, for which, on account of their superior accuracy, he was rewarded with a premium of 3000l. by the Board of Longitude, who brought them to use in the computation of the nautical ephemeris which was published by their order. Some very accurate tables of the satellites of Jupiter, were also compiled from observations by Mr. Wargentin, an excellent Swedish astronomer, and which have since been corrected by the author, so as to render them superior to any yet published.

Among the French astronomers who have also contributed to the advancement of this science, we are particularly indebted to M. de la Caille for an excellent set of solar tables, in which he has made allowances for the attractions of Jupiter, Venus, and the moon, as well as for the observations which he made at the Cape of Good Hope, in concert with the most celebrated astronomers in Europe, in order to determine the parallax of the sun, moon, and the planet Mars; and for adjusting the places of the stars in the southern hemisphere, which he has done with great accuracy. In Italy also the science was cultivated with great success by S. Bianchini, Bucovich, Frisi, Monfredi, Zanotti, and others; and in Germany, by Euler, Mayer, Lambert, &c.

Stirch was the state of astronomy when Dr. Hedges, by augmenting the powers of telescopes beyond the most fanciful expectations, opened a scene altogether unlooked for. By this indefatigable observer we are made acquainted with a new primary planet belonging to our system, called the Georgium Sidus, attended by fix satellites, which he discovered on the 1st of March 1781, and which being at twice the
the distance of Saturn from the sun, has doubled the bounds formerly assigned to the solar sytem. We are also indebted to him for a variety of observations on several other interesting astronomical subjects; such as the discovery of two additional satellites to Saturn, of which the number is now seven; a new method of measuring the lunar mountains; the rotation of the planets on their axes; on the parallax of the fixed stars; catalogues of double, triple stars, &c.; of nebulae; and of the proper motion of the sun and solar system; the accounts of which, together with many other valuable papers, he has communicated from time to time in different parts of the Philosophical Transactions. Within this last year also another new planet has been discovered by M. Piazzi of Palermo, between Mars and Jupiter, to which he has given the name of Ceres Ferdinandea; and even the discovery of a third has been announced in some of the foreign journals; but for any regular account of this we must wait for further information. See Georgium Sidus, Ceres Ferdinandea, and Pallares.

It is with great pleasure we observe that at no former period has this science been cultivated with more ardour than it is at present, both in this and every other country in Europe. In France, the physico-mathematical part of the science has been greatly improved and extended by the celebrated M. la Place, who, in his elaborate work, the "Mechanique Celeste," has investigated all the phenomena, which the attraction or universal gravitation of matter can produce on the forms and motions of the celestial bodies, by their mutual actions on each other. M. Lalande, the patriarch of astronomers, is also still indefatigable in his pursuits, and by the zeal he constantly manifests for the interests of this science, has greatly promoted the study of it in almost every quarter of the globe; but particularly in Germany, where M. von Zach is equally assiduous in forwarding its improvement. In all its collateral branches also we observe a degree of activity that has never been exceeded. New admeasurements of the earth have been undertaken both in this country and in France, which, from the great improvements of instruments, and the skill and industry of the observers, promise a greater accuracy in the results than could have been obtained by those who were formerly engaged in this undertaking. From the zeal and abilities of Major Mudge, in particular, who is now employed by our government to make a trigonometrical survey of the country, we may expect the most accurate details on this subject that have ever yet been presented to the public.

We shall conclude by observing that there still remains a number of discoveries to be made in this science. We have not yet determined the times of rotation and the proper figures of some of the planets and their satellites; nor do we know with sufficient precision the masses of those bodies. The theory of their motions also conflicts in a series of approximations, of which the convergence depends both upon the perfection of instruments, and the progress of analysis, and which for that reason ought to acquire continually new degrees or exactness. Observations on the return of comets already observed, as well as on those which may hereafter appear, should likewise be made with great care, and particularly on such as may entirely change their orbits, as it has been conjectured was the case, by the action of Jupiter on the one which appeared in 1770; as also such accidents which the proximity, and even the shock of these bodies, may occasion to the planets and their satellites; such are the principal objects which should engage the attention of future astronomers.

For more particular accounts of the writings and authors on this science, the reader may consult Heidler's "History of Astronomy," which is brought down to the year 1757, as also "Bailly's History of Ancient and Modern Astronomy," Montucla's "Histoire des Mathematiques," and the first volume of Lalande's Astronomy. The more modern and popular works on the subject are numerous and well known; as those of Emerson, Ferguson, Long, Boucicaut, &c.; in the latter of which, in particular, the elementary parts, and general outline of the science, are described with great perspicuity and elegance.

Astronomy is sometimes divided with respect to its different types, into new and old.

Astronomy, Ancient, is such as the art stood under Ptolemy and his followers, with all the apparatus of solid orbs, epicycles, eccentricities, deferents, tropicalls, &c.

Astronomy, New, is such as the art has been since Copernicus, by whom those fidicious machines were thrown out, and the constitution of the heavens reduced to more simple, natural, and certain principles.

In Ricciolus's Almagestum Novum, published in 1651, we have the several hypotheses of all the astronomers, ancient as well as modern.—And in Dr. Gregory's Elements Astronomiae Physice & Geometricae, in 1702, the whole modern astronomy, as founded on the discoveries of Copernicus, Kepler, and Sir Isaac Newton.—The substance of the old astronomy is given by Tacquet; and of the new astronomy by Whiston, in his Prelections Astronomicae, in 1707. Mercator's Institutiones Astronomicae, published in 1676, contains the whole doctrine, both according to the ancients and moderns; and Dr. Keill's Introduction ad veram Astronam, in 1718, comprehends the modern; so that which might be added Vince's Astronomy, in 2 vols. 4to. 1800; and his Practical Astronomy, 4to.

Astropecten, in Natural History, a name given by some authors to a species of star-fish, composed of a body, or central nucleus, Drawn in the manner of the shells of the common scallop, and parting into five principal rays, from each of which there issue several transverse processes, covered with a hairy down.

Astropodia. See Asteria, and Starbucks.

Astroscope, in Astronomy, a kind of astronomical instrument, composed of two cones, on whose surface the constellations, with the stars, are delineated, by means of which the stars may easily be known.

The astrofcope is the invention of Will. Schickhard, formerly professor of mathematics at Tubingen, who published a treatise expressly on it, in 1698.

Astroscoplia, from αστρον, stars, and σκια, shadow, the art of observing and examining the stars by means of telescopes, in order to discover their natures and properties.

Huygens improved this art considerably in his "Astroscopia Compendiaria Tubi Optici mollimine liberata," where he shows how to manage the largest glasses without help of a tube. See Telescope.

Astrothemata, in Astrology, the places or positions of the stars in a theme of the heavens. Tidal, Lex. Math.

Astrothesia, from αστρον, stars, and γθεια, place, is used for form by a constellation or image in the heavens, composed of several stars.

Astrua, Giovanna, in Biography. See Giovanna.

Astruc, John, M. D. a learned physician, and author of numerous medical and philosophical works, was born at Saum, a considerable town in Lower Languedoc, on the 15th of January, 1682. He was early initiated into the knowledge of the classics by his father, and was sent to complete his education to the university at Montpellier, where in 1700 he commenced master of arts, and
and in 1703, bachelor of medicine. In the same year he
published his dissertation "De motus fermentativi causa," which was soon followed by several controversial pieces on
the manner in which the food is digested in the stomac,
which he contended was effected by a peculiar leaven, ex-
citing fermentations; contrast to the opinion of Pitance
and other mechanical physicians, who attempted to prove
that our food was triturated or ground to a pulp in the sto-
mach by the action of the abdominal and other muscles, to
which they gave a power equal to several thousand pounds
weight. In 1716, he was made professor of anatomy and
medicine at Toulouse. In 1716, he returned to Montpellier,
where he was called to the professor's chair vacant by the
death of Chatelin. In 1726, he published his treatise "De
Hydrophobia," and in 1731, "Sur l'Origine des Maladies
Epidemiques, principalement de la Peste," in which he
strongly supports the opinion that the plague is a contagious
disease, in opposition to Chiracian and other writers, who
then, as now, attempted to establish a contrary doctrine.
He supposed there was some analogy between the poison
of the plague and the venereal disease. He took the first
active part in the dispute between the faculty of medicine
and the surgeons at Paris; and as he was well versed in
the history of medicine, he showed that in early times the
chirurgians were examined by physicians previous to their
being allowed to practice. In 1729, he was invited to Po-
land, and made Physician to the king. Augustus the second;
but finding this place lefts favorable to his studies, he re-
turned to France, and fixed himself at Paris; and in 1730,
was appointed consulting physician to the king, and soon
after, on the death of Geoffroy, professor of medicine in
the Royal College at Paris, where the reputation he had
previously acquired procured him a numerous and respec-
table auditory; pupils flocking to him from all parts of Europe.
In 1737, he published "Memoires pour l'Historie naturelle
de Languedoc," in which a particular account is given of
the mineral waters of Balara. In 1745, he published
"Tractatus Pathologicus," and 1748, "Tractatus Thera-
peuticus," both in 8vo.; which were in their time well re-
ceived, but are superceded now by the adoption of new
theories, in their turn to give way to subsequent specula-
tions. In 1756, he published his principal work "De Mor-
bis Venereis," which soon, and defendedly, raised his fame
to the highest pitch of eminence. The work was eagerly
received, and translated into all the modern languages; the
learned in every country being desirous of naturalizing a
production, containing the completest history, description,
and mode of treating the disease that had appeared. In
the first part, the author labours to show, that the disease
was new, and of a nature distinct from all others; that it
was first imported into Europe by the Spaniards who at-
tended Columbus in the discovery of America. This part
has lately been controverted, and passages from various
early writers have been produced that are supposed to point
out the disease as a single symptom or two resembling some
of those attending the lues venerea being obscurely noticed
in them. He considers mercury as the sole specific in the
cure of the lues venerea, and of the different ways of ad-
ministering it, prefers that by injection. The author soon
after published two "Doutes sur l'Inoculation de la petite
ve- rolle propose a la Faculte de Paris," but without his name;
and in 1759, "Traité des Tumours et des Ulcercs, avec deux
Lettres, 1. sur la composition des quelques remedes; et
2. sur la nature et le succesfully des nouveaux remedes qu'on
propose pour la guerison des maladies venereiues." In
this work, which has considerable merit, the author treats
largely of hydatids passed off by stool and by vomiting, or
found in the livers of persons who have died tabid. He is
one of the first writers who denies his atten to the opinion
that marks, dermatons, and mutilations of the bodies of
infants, are occasioned by the imaginations of the mothers.
In 1746, he published "Traité des Maladies des Femmes,"
6 vols. 12mo.; this has been translated into English, as
well as his "Art d'Accoucher, reduite a ses principes;" the
last work he lived to finish. The author had tried the ef-
fect of cicatrices; he tells us, in cancer, but without advantage;
and thinks its reputation for resolving febris had arisen
from induced glands of the breath which were taken forth,
but were not ichorous, having disappeared under its use.
This opinion has been confirmed by later experience. On
the whole, we find in this writer great marks of genius, as
well as of labour and research, and he will be deferably
handed down to posterity as one who has contributed confi-
derably to the improvement of the art of medicine. As
early as the year 1731, he was admitted member of the fa-
culty of medicine at Paris: he was a constant attendant at
their meetings, and a zealous protector of their privileges.
With an active mind, he had the good fortune to enjoy a
strong and vigorous constitution, which enabled him to con-
tinue his professional exertions until within a very small
time of his death, which happened on the 5th of May
1766, at the age of 82 years. In the second volume of
the author's treatise "De Morbis Venereis," he has given
catalogue of all the writers who had treated on the subject
before him, with brief sketches of their lives, and analyses
of their works. This part appears to have been executed
with fidelity, and has afforded us useful and valuable mate-
rials in our labour, as has likewise a posthumous work of
the author, his "Memoires pour l'Historie de la Faculte de
Med. & Chirur. Lorry Eloge Hift, de M. Astruc. One
very sagacious work little noticed, and perhaps little deserving
notice, as founded solely on speculation and conjecture,
was his "Conjectures sur les memoires originaux dont il pa-
roit que Moliere se fervo pour composer le livre de Genese,"
Bruxelles, 1759. It does not appear that the works of
this celebrated writer were ever collected and published
in the manner they are certainly deserving that attention.
ASTRUM, or ASTRON, in Astronomy, a constellation
or assemblage of stars. In which sense it is distinguished
from after, which denotes a single star.
Some apply the term, in a more particular sense, to the
Great Dog; or rather to the great bright star in his mouth.
Vital.
ASTRUM, in Ancient Geography, the name of a large town
of the Peloponnesus, in the Argolid.
ASTRUM, in Geography, a mountain of Italy, famous
for its baths.
ASTRUP, a town of Germany, in the circle of West-
phalia, and bishopric of Osnaburgh, four miles north of
Osnaburgh.
ASTURA, in Ancient Geography, a river of Italy, and
rises an island, according to Pliny.—Cicero had a villa
of this name near the sea, within view of Circeum and Aنتium,
whither he retired, with his brother and nephew, when he
first arrived at his Tuscan villa the news of the proscrip-
tion in which they were included, and whence they pro-
posed to transport themselves directly out of the reach of
their enemies. Here Cicero found a vessel ready for him,
in which he immediately embarked; but the winds being
adverse, he was obliged to land at Circeum, near which he
spent a night, in great anxiety and agitation. The
question upon which he deliberated was, what course he should take; and whether he should fly to Brutus or to Cassius, or to S. Pompeius; but, after all his deliberations, none of them pleased him to much as the expedient of dying; so that, as Plutarch says, he had some thoughts of returning to the city, and killing himself in Cassius's house; in order to leave the guilt and curse of his blood upon Cassius's perfidy and ingratitude: but the importunity of his servants induced him to fall forwards to Cæsarea, where he landed to repose himself in his Formian villa, about a mile from the coast; "weary of life and the sea, and declaring that he would die in that country which he had often faved." Either he was pursued by the soldiers that were sent in quest of him; and though he fled into the woods, he was overtaken and put to death. Middleton's Cicero, vol. ii. p. 495.

ASTURIA, in Geography, a good harbour on the south-west coast of Italy, about twelve or fourteen leagues south-east from the mouth of the Tiber; at the bottom of a bay east from port Neptuni, and nearly east from mount Cerceii.

ASTURAGAMICOSK, a lake of Lower Canada, eighty-one leagues north-east of Quebec. N. lat. 50° 25'; W. long. 67° 25'.

ASTURIA, in Ancient Geography, a kingdom of Spain, subdued by the Roman emperor Augustus, after the people had long resisted, in connection with the Cantabrians, renewed attempts to reduce them under the Roman yoke. But at length the darts of famine was so great, that they determined to surrender; upon which the Cantabrians, who, despairing of their situation was, were resolved to renew their efforts, fell upon them, and compelled 10,000 of them to seek an asylum in the Roman intrenchments. Tiberius, however, refused to admit them into the camp; so that despairing of relief, some fell upon their own swords, others threw themselves into the flames which they had kindled for this purpose, and others dispatched themselves by poison. The surviving Asturians collected all their strength against the next campaign; but the utmost efforts of their valour and despair proved fruitless. Weakened by repeated defeats, they were under the necessity of submitting to the Roman power, till the subversion of that empire by the Goths. In the beginning of the eighth century Don Palayo restored the Spanish monarchy in the Asturias. Asturia, the capital of the Asturians, was, in ancient times, the famous "Colonia Augusti," mentioned by Pliny. This place divided the Astures into Augusti and Transmontani. The seventh Roman legion, intitled "Augusta Gemina," was settled between the Asturian sea and the capital of this district, called "Asturia Augusti," now Astorga. The country derives its name from the river Astura, and is now denominated "Asturias." It was formerly celebrated by the poets for the gold it produced.

A STURIAS, in Geography, the ancient Asturio, a province of Spain, about forty-eight leagues long, and eighteen broad; bounded on the east by Bifcay, on the south by Old Caftile and Leon, on the west by Galicia, and on the north by the bay of Bifcay. It is usually divided into two parts or districts called Asturia of Oviedo, and Asturia of Santillane; and hence it derives its plural name Asturias. The country is generally mountainous and rugged; and towards the south are the mountains which branch from the Pyrenees, and separate it from Old Caftile and Leon; there are covered with extensive forests. The soil, however, produces a sufficiency of corn, great quantities of fruit, and excellent wine. Its horses are in great esteem, and maintain their reputation from the time of the Romans, who preferred them to all the other horses in Spain. The inhabitants, who value themselves even at this day on the purity of their blood, and their descent from the ancient Goths, are poor, but honest, generous, brave, and laborious. The principal towns are Oviedo, Santillane, and San Aturo. The chief of the king of Spain takes the title of the prince of Asturias, and bears the arms of the country.

ASTURICANI, in Ancient Geography, a people of Atlantic Sarmatia. Prolemy.

ASTURASPES, a name formerly given to a river of Abyssinia, now called Exas. It is one of the rivers represented by the ancients as forming the island of Meroe.

ASTY, a village of Egypt, mentioned by Diodorus Siculus; in the vicinity of Canopus, according to Steph. Byz.

ASTYAGES, in Biography, king of the Medes, was the son of Cyaxares, according to Herodotus (I. c. 74.) and Pausanias (I. v. c. 12. p. 398.); and began his reign, according to Blair's tables, in the year 595 B.C. Sir Isaac Newton (Chron. apud Oper. I. v. p. 222.) says that, Herodotus, followed by Pausanias, has inverted the order of the kings Alyages and Cyaxares; making Cyaxares the second king of the son and successor of Phraotes, and the father and predecessor of Alyages, the father of Mandane, and grandfather of Cyrus. Considering, he adds, that Cyaxares reigned long, and that no author mentions more kings of Media than one, called Alyages; and that hehe was, lived in those days, knew but of two great monarchs of Media and Persia, the father and the son, older than Cyrus, he concludes, that Alyages, the father of Mandane, and grandfather of Cyrus, was the father and predecessor of Cyaxares; and that the son and successor of Cyaxares, was called Darius. Accordingly, he says, that Alyages began his reign at the death of Phraotes, who was slain by the Alyrians in the year of Nabonassar 111. or 657 B.C., and reigned 26 years. According to Herodotus, Alyages married his daughter to a Persian nobleman named Cambyses. During her pregnancy he had a dream, signifying that the child that was to be born should rule over all Asia. This prediction alarmed him; and he determined to destroy the child. Harpagus, who was employed for this purpose, disobeyed the royal command, and intruded the nurture and education of the infant Cyrus with one of the king's herdmen. When Cyrus was ten years old, Alyages discovered the fraud, and caueth the only son of Harpagus to be killed, and his flesh to be served up to him in a banquet. Harpagus for some time dissembled his indignation at this act of barbarity, but waiting a favorable opportunity of revenge, he called Cyrus, arrived at manhood, from Persia, whether he had been sent to his real parents, and afflicted him to revolt against his grandfather. Alyages was defeated, and caueth the Magi, who had led him to imagine that the danger apprehended from his son's revolt was at an end, to be all imputed. In a second engagement he was defeated and made prisoner; upon which he was deposed by Cyrus, after having reigned 35 years, and the Medes were subjected to the Persians. Alyages was confined to his palace, but suffered to close his life by a natural death. Xenophon, in his "Cyropedia," a work which the best critics have considered as a fiction than a true history, represents Cyrus as having been openly educated at the court of his grandfather Alyages, who retained the crown till his death, and was succeeded by the son of Cyrus II. Alyages has been reckoned by some the "Ahaferus" of Persia.

ASTYANAX, in Ancient History, the only son of Hecuba and Andromache. Calchas, the soothsayer, predicted,
dected, that if he lived to manhood, he would be more valiant than his father, and avenge his death. It was therefore determined to dispatch him in his minority. Andromachia took pains for concealing him; but, it is laid, that Ulyfles discovered him, and precipitated him from the top of the Trojan walls. The death of Abyanax is the principal sub-
ject of Eurydice's tragedy of the Trojans.

ASTYNAE, in *Asynians*, were magistrates at Athens who had the inspection of the streets, and also of players on instruments and buffoons. They were ten in number, and corresponded to the plebeian aediles of Rome. See Agoranomus.

ASTYPALEA, in *Ancient Geography*, an island of Asia, in the Cretan sea, where, according to Cicerio De Nat. Deor. i. iii. c. 18.), divine honours were rendered to Achilles. Steph. Byz. fays, that this island, one of the Cyclades, was called Pyria when the Carian poiffessed it, and afterwards Pyrea. Its name Aystpalaec, in its proper signification, means the "ancient city," and is said to be derived from that of the daughter of Phoecis and Piramed, offer of Europe, and beloved by Neptune, by whom he had Ancus, who received for the people named Lelegi, Paulin. i. vii. c. 1. It was also called "Theontrapaex," i.e. the table of the gods, because its foil is fertile, and almost enamelled with flowers. It now bears the name of Stambalia.—Alfo, a town of the island of Cos. Strabo.

—Alfo, a promontory of Aisa Minor, in Caria, in the territory of Mindus. Strabo.—Alfo, a town of the island of Sanius.

ASTYRA, or Astyre, a town of *Aolis*; but it no longer subsisted in the time of Pliny.—Alfo, a village of Aisa Minor, in the Troade, near mount Ida, in the vicinity of which was a grove consecrated to Diana Aistyrenc.—Alfo, a town of Phoenicia, in the neighbourhood of the isle of Rhodes. Steph. Byz.

ASTYRON, a town of Ilyria, built by the Argonauts.

ASUCRA BAY, in Geography, lies on the south part of the gulf of Sofala, on the S. E. coast of Africa, in the Indian ocean.

ASUM, in *Ancient Geography*, a town of the island of Crete (Plyn), the Afof of Steph. Byz. whence Jupiter derived the appellation of Aeus.

ASAM, of *Asion*, in Geography, a town in Africa, on the &a-coast of the kingdom of Adel.

ASUMATZ, a town of Wallachia, eight miles eaf of Buchereft.

ASWAD, a town of Arabia, 28 miles south of Saad.

ASYLIA, in *Ancient Geography*, a town of Spain, in the country of the Tartians. Piolemy.

ASYLUM, a sanctuary or place of refuge, where a criminal who seeks himself is deemed inviolable, and not to be touched by any officer of justice.

The word is compounded of the privative particle α, and τελέω, I burn; because no person could be taken out of an asylum without sacrilege.

The first asylum was established at Athens, by the descendants of Hercules, to shelter themselves from the fury of his enemies; to serve as a refuge for children who fled from the ill treatment of their parents, and, as some have laid, to be a sanctuary for filpiants in general. This is laid by Statius, Theb. xii. and Servius, in Æneid viii. to have been the first asylum; others fuppofe that it was firft built at Thebes by Cadmus, for the reception of all criminals. Paulin. i. vii. Æn. i. ii. v. 112. Eurip. Hecube, v. 146. In imitation of the asylum of Cadmus, Romulus established one between the two groves on the Capitoline mount, which was free of access to all criminals. The oracle of Delphos, according to Phtarch, functioned this political establishment of Romulus with its approbation. When Romulus enlarged his new city, which by this policy was fenced with inhabitants, the asylum was included within the walls, and those who had fled to it, being brought under some regulations, became citizens of Rome. Plut. in Rom. i. c. 19. Dion. Hal. i. ii.

The temples, altars, statues, and tombs of heroes, were, annually, the ordinary retreat of those who found themselves aggrieved by the rigour of the laws, or oppressed by the violence of tyrants: but temples were held the most sacred and inviolable refuge. It was fuppofed, that the gods took upon them to punish the criminal who thus threw himfelf upon them; and that it would be a great impiety in man to take vengeance out of the hands of the immortals.

The Israelites had their cities of refuge, which were of God's own appointment; where the guilty, who had not committed murder, fled for safety and protection. As to the heathens, they allowed refuge and impunity even to the vilest and most flagrant offenders, come out of superftition, and others for the sake of populating their cities; and it was by this means, and with such inhabitants, that Thebes, Athens, and Rome, were first fenced. We even read of afluims at Lyons and Vienne, among the ancient Gauls; and there are some cities in Germany which still prefer the ancient right of asylum.

Hence, on the medals of several ancient cities, particularly in Syria, we meet with the inscription ΑΣΥΛΟΣ, to which is added, ΙΕΠΑΙ. This quality of asylum was given them, according to M. Spanheim, in regard to their temples, and of the gods revered by them.

The fame qualities have also been given to deities: thus Diana of Ephesus is called ασυλός. Add, that the camp, formed by Romulus and Remus, was called asylum, and afterwards became a city, in which was a temple erected to the god *Aysiaus, ος Ασυλόν*.* It appears from Plautus (Moell. v. 1.), that slaves had particular afluims: fuch was the temple at Athens; or the tomb of Thefeus; because he never refused to avenge the oppressed, and to succour the wretched. The temple of Diana at Ephesus was an asylum for debtors. In proces of time, afluims were fo multiplied, that it became neceffary to regulate and reform them, in the reign of Tiberius, as we are informed by Tacitus (Annal. iii. c. 60.); and Suetonius (Tiber. c. 37.) fays, they were utterly abolished.

The emperors Honorius and Theodosius granting the like immunities to churches, the bishops and monks laid hold of a certain tract or territory, without which they fixed the bounds of the eccularjurisdiction: and fo well did they manage their privileges, that convents, in a little time, became next akin to forfresses, where the most notorious villains were in safety, and braved the power of the magifrate.

These privileges, at length, were extended not only to the churches and church-yards, but also to the bishops' houses, whence the criminal could not be removed without a legal assurance of life, and an entire remission of the crime. The reason of the extension was, that they might not be obliged to live altogether in the churches, &c. where several of the occasions of life could not be decently performed.

But, at length, these afluims, or sanctuaries, were also stripped of most of their immunities, because they served to make guilt and libertinifm more bold and daring. In Engl
LAND, PARTICULARLY, THEY WERE ENTIRELY ABOLISHED. SEE SACRAMENT.

ASYMMETRY, derived from the primitive a., evq., quit., and pereq., measure, q. d. without measure, a want of proportion, or correspondence between the parts of a thing. SEE SYMMETRY.

In Mathematics, the word is more particularly used for what we more usually call incommensurability; which is when between two quantities there is no common measure: as between the side and diagonal of a square. In number, two roots, $a^2$, $a^2$; are incommensurable to rational numbers.

ASYMPTOTE, in Geometry, a line which continually approaches nearer and nearer to another; yet will never meet with it, though indefinitely produced.

The word is compounded of the privative a., evq., quit., and $=m$ from $=m$. I fail; q. d. incoincident, or which never meet. Some Latin authors call these lines intangible.

Berthou enumerates divers sorts of asymptotes; some straight, others curve; some concave, others convex, &c. and farther, proposes an instrument for describing them. Though, in strictness, the term asymptote seems appropriated to right lines. Asymptotes, then, are properly right lines, which approach nearer and nearer to some curve of which they are said to be the asymptotes; but which, though they and their curve were indefinitely continued, would never meet: consequently asymptotes may be conceived as tangents to their curves at an infinite distance.

Two curves are also said to be asymptotic, when they thus continually approach, without a possibility of meeting.

Of lines of the second kind, or curves of the first kind, that is, the conic sections, only the hyperbola has asymptotes, which are two in number, the properties of which have been long ago demonstrated by Apollonius Pergaeus.

All curves of the second kind have at least one asymptote; but they may have three; and all curves of the fourth kind may have four asymptotes.

The conchoid, cissoid, and logarithmic curve, though not reputed geometrical curves, have each also one asymptote.

The nature of asymptotes will be easily conceived from the instance of the asymptote of a conchoid. Suppose $MMAM$, &c. (Plate Analysis, fig. 2.) to be a part of a conchoid, $C$ its pole, and the right line $BD$, fo drawn that the parts, $QA$, $EA$, $OM$, &c. of right lines drawn from the pole $C$, are equal to each other; then will the line, $BD$, be an asymptote of the curve; because the perpendicular, $MI$, &c. is shorter than $MO$, and $MR$ than $MQ$, &c. so that the two lines continually approach; yet the points, $M$, &c. and $R$, &c. can never coincide, since there shall be a portion of a line to keep them asunder; which portion of a line is infinitely divisible, and consequently must be diminished infinitely before it becomes nothing.

ASYMPTOTES OF THE HYPERBOLA are thus described. Suppose a right line $DE$ (Plate 1. Conics, fig. 2.) drawn through the vertex, $A$, of the hyperbola, parallel to the ordinate $Mm$, and equal to the conjugate axis, viz. the part $DA$, or $AE$, equal to the semi-axis: then, two right lines drawn from the centre $C$ of the hyperbola through the points $D$ and $E$, viz. the right lines, $CF$ and $CG$, are asymptotes of the curve.

The parts of any right line, lying between the curve of the common hyperbola and its asymptotes, are as one to another on both sides, that is $mn = MR$. Thus also, in hyperbolae of the second kind, if a right line be drawn, intersecting the curve and its three asymptotes in three points, the sum of the two parts of that right line extended in the same direction from any two of the asymptotes to two points of the curve, is equal to the third part which extends in the contrary direction from the third asymptote to the third point of the curve.

If the hyperbola $GMH$ (fig. 3.) be of any kind whose nature with regard to the curve, and its asymptotes, is expressed by this general equation, $x^2 y^2 = n + 1$; and the right line $PM$ be drawn any where parallel to the asymptote $CS$, and the parallelogram, $PCOM$, be completed: this parallelogram is to the hyperbolic space $PMGD$, contained under the determinate line $PM$, the curve of the hyperbola, $GM$, indefinitely continued towards $G$, and the part, $PB$, of the asymptote indefinitely continued the same way, as $m-n$ is to $n$: if it be greater than $n$, the said space is finite and quadrable; but when $m-n$, as it will be in the common hyperbola, the ratio of the foregoing parallelogram to that space is $3000$ to $2$; that is infinitely greater than the parallelogram, and so cannot be obtained; and when $m$ is less than $n$, $m-n$ will be negative, and the parallelogram will be to the space as a negative number to a positive one, and the said space is called by Dr. Wallis more than infinite. SEE HYPERBOLA.

ASYMPTOTE OF A LOGARITHMIC CURVE. If $MS$ (Plate Analysis, fig. 3.) be the logarithmic curve, $PT$ an asymptote, $PT$, the subtangent, and $MP$ an ordinate; then will the intermediate space $RPM = PM + PT$; and the solid, generated by the rotation of this curve about the asymptote, $VP$, rated by half of a cylinder whose altitude is equal to the length of the subtangent, and the semi-diameter of the base equal to the ordinate $Q$. SEE LOGARITHMIC.

ASYMPTOTES, are by some distinguished into various orders. An asymptote is said to be of the first order, when it coincides with the base of the curvilinear figure: of the second order, when it is a right line parallel to the base: of the third order, when it is a right line oblique to the base: of the fourth order, when it is a common parabola, that has its axis perpendicular to the base: and, in general, of the order $n+2$, when it is a parabola, the ordinate of which is always as a power of the base, whose exponent is $n$. The asymptote is oblique to the base, when the ratio of the first fluxion of the ordinate to the fluxion of the base, approaches to an affinnable ratio, as its limit; but it is parallel to the base, or coincides with it, when this limit is not attainable.

The determination of the asymptotes of curves, is a curious part of the higher geometry. M. de Fontenelle has given several theorems relating to this subject, in his "Geometrie des Indes." See also Stirling's "Lines tertii Ordinis," and Newton's "Principia vi," where the subject of asymptotes is elaborately discussed; and Cramer, "Introduction a l'Analyse des Lignes courbes," art. 147, &c. in which is given an excellent theory of geometrical curves and their branches. This subject is also treated accurately by Mr. Machuroir, in his Fluxions, book i. chap. 15, where he has been careful to avoid the modern paradoxes concerning infinites and infinitesimals. The areas bounded by curves, and their asymptotes, though indefinitely extended, sometimes have limits to which they may approach, so as to differ less from those limits than by any given quantity. This happens in hyperbolae of all kinds, except the first, or Apollonian. The same is also true of the area, comprised between the logarithmic curve and its asymptote. SEE LOGARITHMIC CURVE. Those who do not scruple to suppose the curve and its asymptote to be infinitely produced, say, that the infinitely extended area becomes equal to its limit.

The asymptotical area in the common or Apollonian hyperbola, and in many other curves, has no limit; and it is usual to say, these areas are infinitely great: by which, however, no more is meant, than that the curve, and its asymptote,
ASYMPTOTES, Parabolic. See PARABOLIC ASYMPTOTES.

ASYMPTOTIC Spaces. See HYPERBOLOID.

ASYNDONET, derived from the privative a, and συνω, I labor together, a figure in Grammar, implying an omission of words, or a defect of those particles that connect the members of a sentence with one another. The want of such particles represents either the celerity of an action, or the haste and eagerness of the speaker. As, in the instance, "veni, vidi, vici," I came, I saw, I conquered! in which Caesar expresses his conquest of Pharamas (Suet. in vit. c. 47.), where the copulative et, and, is omitted; or in that of Cicero concerning Catiline, "abitus, excidunt, evitatum, erupit! he is gone, departed, escaped, broke out!" or in that verse of Virgil,

"Ferite citrimum, date vela, impellite remos."

This concise mode of speaking adds a considerable emphasis to the expression; and, by bringing the several parts of a subject nearer together, affects the mind with greater force. Thus Cicero (Pro Mur. c. 29.) lets Cato's character in a very strong and beautiful light by the use of this figure. "Nature itself has made you a great and excellent man for integrity, gravity, temperance, magnanimity, justice, in a word, for all virtues."

Asynodens lands opposed to polysynodens, where the copulatives are multiplied.

ASYNTHES, or Ros Stor, in Geography, a cape on the west coast of Scotland, in the county of Sutherland. N. lat. 58° 54′; long. 1° 58′ W. Edinburgh.

ASYPHUS, in Ancient Geography, a mountain of Africa, in the Marmarica. Ptolemy.

ATA, or ATATSCHAI, in Geography, a rivulet of Perin, in the province of Schirwan, serving as a boundary to some of the districts into which it was divided.

ATABULI, in Ancient Geography, a people of Africa, placed by Phinis in the small island of Meroe.

ATABULUS, in Physiology, a kind of wind in Apulia, of a dry pinching quality, and very noxious in its effects.

The ancient naturalists speak of the atabilus in terms of horror, on account of the ravage it made among the fruits of the earth, which it scorched or withered up.

ATABYRUS, in Geography, the name of a mountain in the island of Rhodes, whence the island itself was denominated ATABYRIA. The name is supposed to have been derived from Phoenicia, where Atabyr denoted a place of good pasture, and it was applied to the Tarbor of Diocletian, belonging to the tribe of Zabulon. On this mountain was situated a temple of Jupiter, hence called ATABYRIUS, much celebrated by heathen historians and poets. Here, fabulous report says brazen oxen announced by their bellows any approaching calamity. The fable is explained by supposing that the priests of this temple pretended to be endowed with the spirit of prophecy.—Alfo, a mountain of Sicily, so called on account of a temple of Jupiter Atabvrius, and of Minerva, that was erected on its summit.—Alfo, a town of Phoenicia, according to Steph. Byz.: or of Carisbry, according to Polybius.

ATACAMA, in Geography. See ATTACAMA.

ATACINI, in Ancient Geography, a people of Europe, in Gaul, who inhabited the banks of the Aror (Aure), whence their name, near the Volcan Teofigates, and north of the Sardoni. Their capital was Narbo.

ATACHALPA, in Biography, the son of Huana Capac, by the daughter of the sovereign of Quito; who was appointed by his father, when he died in 1529, his successor in the kingdom of Quito; the rest of his dominions being bequeathed by him to Huascar, his elder son by a mother of the royal race. The defilement of Huana Capac concerning the succession, excited general difguft at Cuzco; and Huascar, encouraged by his subjects, required his brother to renounce the government of Quito, and to acknowledge him as his lawful superior. Atahualpa, having secured in his interest a large body of troops which had accompanied his father to Quito, and which formed the flower of the Peruvian warriors, first eluded his brother's demand, and then marched against him in hostile array. This contest between the brothers involved Peru in a civil war, which terminated in the defeat and captivity of Huascar, and in the extermination of the royal race by the murder of all the children of the sun, as the descendants of Marco Capco were denominated, whom Atahualpa could feize either by force or stratagem. At this time Pizarro, the Spanish adventurer, arrived in Peru; and being solicited by messengers deputed by Huascar, to affift him in subduing his brother, who was represented as a rebel and an usurer, he directed his course towards Caxamalca, a small town at the distance of twelve days march from St. Michael, where Atahualpa was encamped, with a considerable body of troops. The reigning inca dispatched a messenger to Pizarro, as he was advancing, with a valuable present, offering his alliance, and alluring him a friendly reception at Caxamalca. Pizarro, on his part, returned professions of regard, and a declaration that he was now advancing, as the ambassador of a very powerful monarch, with an intention to offer Atahualpa aid against those enemies who disputed his title to the throne. This pacific and friendly declaration removed the inca's fears; and Pizarro was allowed to march, without interruption, to Caxamalca; in his approaches to which he received renewed professions of friendship from Atahualpa, and additional presents. The peridious Spaniard determined to avail himself of the unsuspecting simplicity with which Atahualpa relied on his professions, and to feize his person during the interview to which he had invited him. Accordingly he made preparations for this purpose; and as the inca drew near the Spanish quarters, with a numerous and splendid train, the friar Valverde advanced to meet him, with a crucifix in one hand, and a breviary in the other; and in a long discourse explained to him the doctrines of religion, and the authority of the pope, cloathing his harangue with a requisition, that the inca would embrace the Christian faith, acknowledge the supreme jurisdiction of the pope, and submit to the king of Castile as his lawful sovereign. This requisition was enforced by promises of protection, if he complied, and by threats of vengeance if he refused to obey the summons. The inca hesitated and demurred; he pleaded his
his right to empire by hereditary succession; he expressed his surprise that a foreign priest should dispose of territories which did not belong to him, and without the consent of the rightful possessor; and he professed that he had no inclination to renounce the religious institutions established by his ancillary, and that he could not abandon the service of the faith, the immortal divinity whom he and his people revered, in order to worship the god of the Spaniards, who was subject to death. As to other matters, which he had never heard before, and the meaning of which he did not now understand, he desired to know where the priest had learned such extraordinary things: "In this book," replied Valverde, reaching out to him his breviary. The inca eagerly opened it, and turning over the leaves, lifted it to his eye: "This," says he, "is silent; it tells me nothing!" and he threw it with disdain to the ground. The enraged monk exclaimed to his countrymen: "To arms, Christians, to arms; the word of God is insulted; avenge this profanation on those impious dogs." The force being now completed, the Spaniards rushed upon the innocent Peruvians, maimed many of them without mercy, and seized the person of the inca himself, who was detained in captivity. The dejected prince, anxious to regain his liberty, proposed a ransom, and such was the amount of it, that the Spaniards themselves were astonished, even after all they knew concerning the opulence of his kingdom. The apartment in which he was confined was twenty-two feet long, and fifteen broad; and the captive monarch proposed to fill it with vessels of gold as high as he could reach. Pizarro closed with the alluring proposal, and a line was drawn upon the walls of the chamber to mark the stipulated height to which the treasure was to rise. When this immense mass was nearly collected by the faithful attachment and active zeal of his subjects, the inca was allowed to facriph to his own safety the life of his captive brother Huascar; but though the Spaniards divided among them the rich spoil of Peru, the inca was continued in confinement. He now became an object of contention between the soldiers of Pizarro, and those that were newly arrived under Almagro; and the latter demanded his life, that there might be no pretext of inequality in sharing the future plunder of Peru, under the notion of its being the inca's ransom. Pizarro at length consented to sacrifice the inca; and after a mock trial, Atahualpa was found guilty, and condemned to be burnt alive. Prior Valverde prohibited the authority of his faced function to confirm this sentence, and by his signature warranted it to be just. Abominable at his fate, Atahualpa endeavoured to save it by tears, by promises, and by entreaties, that he might be sent to Spain, where a monarch would be the arbiter of his life. Pizarro was inexorable; and the inca was led to execution. Valverde attended him, and attempted to convert him to embrace the Christian faith, by a promise of procuring a mitigation of his punishment. The dread of a cruel death, at length, extorted from the trembling victim a desire of receiving baptism. The ceremony was performed; and Atahualpa, instead of being burnt, was strangled at the stake. This event happened A. D. 1533; and thus terminated the life and reign of the last inca of Peru. Robertson's Hist. Amer. vol. i. p. 29—57.

ATAJ, in Ichthyology, a name given by some writers to a species of Scelena, observed by Forskal. It is an inhabitant of the Red Sea.

ATAIJ, in Alchimy. See Alcair.

ATAKKENF, in Geography, a town of Asiatic Turkey, in the province of Natalia, forty-four miles north-west of Eregris.

ATALA, a small town of Sicily, in the valley of De-
the ancient peninsula Morocco. The Dawshe Arabas, who constantly live in tents, bear a mortal enmity to all who inhabit villages, and, as occasion offered, have laid waste the greatest part of Aatabar. The strength of Teawa, says Bruce, was about twenty-five horses, of which about ten were armed with coats of mail; and they had about a dozen firelocks. The rest of the inhabitants might amount to 1200 men, naked, miserable, and delinquent Arabs, like the rest of those that live in villages, who are much inferior to the Arabs that dwell in tents. In this desert and poor country, it is not to be expected that trade of any kind should flourish; but there is a miserable manufacture of coarse woolen cloths, of the size of large towels, sufficient to go round the middle, which pays current, like specie, all over Aatabar; they are called "Dimocks," and are used instead of silver money. The mahalas, a very bad copper coin, pales for smaller matters; so that the currency of Teawa islands thus:

20 mahalas, 1 cruc, 4 metical, 1 vaskia.

The vaskia of gold is worth about forty-five shillings; but the only commerce of Teawa is carried on by exchange, as salt for grain, canals for salt; the value of goods varying according to the scarcity or plenty of one sort of commodities with respect to the other. Bruce's Trav. vol. 4. p. 426.

ATCHAIRSKOI, a fortress of Siberia, on the Irtili, twenty-eight miles south-west of Omichi.

ATCHAK, one of the Fox islands, about 800 versts distant from the Aleuten islands; lying in 56° N. lat., and extending from W. S. W. towards E. N. E. It resembles Copper island, and has a convenient harbour on the north.

ATCHE, in Commerce, a small silver coin, current in the flates of the Grand Seignor, equal to about a third part of the English penny. The atche is the smallest coin used in Turkey; where there is no copper money current, except in the province of Babylou. Some call the atche the little alper; it is stamped like the para, with Arabic characters. Three or four atches are commonly given in exchange for the para.

ATCHIEVEMENT, in Heraldry, signifies the arms, crests, and supporters, which a person has a lawful right to bear, with all the exterior ornaments, as helmet, mantle, motto, &c. &c. See Funeral Achievements. ACHIEU, See Achievement.

ATCHEI Kouiifs, a lake of America, in Labrador, which conveys its water southerly, through a connected chain of small lakes, into the river St. Lawrence.

ATCHINSK, one of the six districts of the province of Tomsk, in Russia, situated on the river Tchulyn, falling into the Ob. The Town is 424 miles E. S. E. of Tobolok. N. lat. 55° 20'. E. long. 124° 36'.

ATE, derived from ἀτός, to hurl, in Mythology, the daughter of Jupiter, and the goddess of mischief. She was cast down from heaven by Jupiter, who, deceived by Juno, in causing Euripheus to be born before Hercules, was incensed, and manifested his resentment again Ate, as the cause of the offence, by precipitating her from heaven, and saying that she should never return thither. Homer, I. xix. 125. Mythologists explain the fable thus: Ate is the daughter of Jupiter, because evil happens by the permission of providence; and her banishment from heaven to earth signifies the dreadful effects of divine justice among men.

ATECA, in Geography, a town of Spain, in Arragon, upon the river Xalon, two leagues above Calatstaun; sup-posed by Cluverius to be the Ancient "Attacum" of the Celtiberians, placed by others at Daroca.

ATEGAR, a weapon among the Saxons, which seems to have been a hand-dart. The word comes from the Saxon attacan, to fling, or throw, and gar, a spear.

ATEGUA, in Ancient Geography, a town of Spain, situate near the river named "Fimien Salsum," or "Sal-fusa." Pompey having pulled this river, encamped between Ucubis and Ategua, to oblige Cesar to raise the siege of the latter place; but it was taken in his presence. It occurs in the route from Anticaria to Hifpalus.

ATELA, a town of Aia Minor, in the Palmyrene. Ptolomy.

ATELEIA, in Antiquity, denotes an exemption from tribute, taxes, or other burdens.

Ateles, Artes, Artesanias, is particularly used, in some Ancient Laws, for an exemption from offices, granted to the Egyptian clergy by Constantius.

ATELLA, in Ancient Geography, a town of Italy, in the Campania, south-west of Capua. It was first declared municipal, and afterwards became a colony. The ruins of this ancient city of the Oscans may be now seen two miles to the south of Aversa, at a place called "S. Alpino di Aetella."

ATELLA, in Geography, a town of Italy, in the kingdom of Naples, at the foot of the Apenines, in the Basilicata, two leagues from Melphi.

ATELLANE, in Antiquity, a kind of comic and satiric pieces presented on the Roman theatre; somewhat less ludicrous than the farces on the English stage, and yet less serious than the Greek and Latin comedies and tragedies. The atellanes, or fabule atellane of the Romans, answered to the fatrye among the Greeks. They were thus called from Atella, a city of Tuscany, where they were first represented; and from whence, on account of their mirth and humour, they were introduced into Rome. But they became at length so licentious and impudent, that the senate was obliged to suppress them.

ATELLARA, or ATELLARI, in Geography, a river of Sicily, which runs into the sea between Syracuse and Cape Pallaro.

ATELLUM, in Ancient Geography, a town of Italy, in Magna Graecia, north-west of Venuha.

AT-TEMPO GIUSTO, in Minos, implies a steady, just time; not very quick, but firm and exact. At-temps, after recitative, a paufe, or ralentando, implies a return to the first time.

ATENA, in Geography, a small town of Italy, in the kingdom of Naples, situate on the river Negro, in the Principato Cura, ten miles west of Marzano Novo.

ATER, in Ancient Geography, a mountain of Africa, in the Syrtis Minor, which, according to Pliny, extended itself to a considerable distance from the east to the west, and was called by the Romans, "Mons Ater," because it was scorched by the heat of the sun. The mountainous tract, known to the ancients by the name of Mons Ater, is now designated the "Black Harthtch."

ATER, in Conchology, a species of Mytilus, described in Molin. Hist. Chit. p. 177. and said to frequent on the shores of that country. It is fculoured or grooved, with the posterior part white, Gmel. This shell is rough like some species of pinnae; dull blue; fish black, and not edible.

ATER, a species of Strombus found in the boggy parts of the island of Amboyna. This shell is smooth, and has the lip separated before and behind. The length is about two inches; colour black, brown, or bay, and white within; very finely striated transversely; aperture ovate; spire sub-
A T E

ulate, and consisting of twelve contiguous flatish whorls. Gmelin, Litter, &c.—Mühl in his Hill, Vern. Flav. et Terr. defines it as Neritæ tecta fulvata levii, aperture antice posticeque nativa.

Ater, in Entomology, a species of Dermites found in the neighbourhood of Upal, and described by Dr. Thunberg, in Nov. Äd. Upl. 4. p. 46. n. 4. It is glossy black, with the wing-cases thinly punctured. This is a small insect.

Ater, a species of Hydrophilus, a native of Europe. This is black and glabrous; antennæ and shanks reddish. Gmel.

Ater, a species of Byrums that inhabits Germany, and in shape and size resembles byrrhus pilula. It is black and without spots. Fabr. This is *Hydrea nigra nitens glabra* of Geoffroy.

Ater, a species of *Tenebrio* found in Europe. This is a black colour, with furrowous antennæ. 1. Lin.

Ater, a species of Cerambyx (Callidium Fabr.) found in the environs of Venice. It is black, with truncated wing-cases, and moderate antennæ. Scopoli, Gmel. &c.

Ater, a species of Gryllus (Acheta Fabr.) that inhabits Strinam. The colour is dark brown, and the tail of the female is unarmed. Degeer Inf. 3.—Gmel.

Ater, a species of Cimex (Cocelipratis Sec.); This insect is glossy-black, with the apex of the wing-cases very pale. Fabr. Mant. Inhabits Germany, and is about half the size of cimex zolerae.

Ater, is also a species of Cimex in the Linnaean Fa. Sv. 944. The body is entire, and in Gmelins arrangement it belongs to the section elateres. Geoffroy describes it as being black and oblong, and the antennæ terminating each in a bristle or hair. Inhabits the north of Europe and Calabria.

Ater, a species of Cynips, described by Schrank among the insects of Germany, and which form and inhabit vast excrences on the trunks of plants. It is black, with elevated dots; turfs of the legs paler. Ater, a species of Bombylius described by Scopoli, Schaffer, &c. It inhabits Germany. The colour is black; base of the wing half-black; abdomen spotted with white, Fabr. Spec. Inf.—Front of the head and thorax downy, and a white dot before each eye.

Ater, a species of Asillus found in Europe. It is black and hairy, with a white beard. Fa. Sv. Scopoli calls it erax protractus.

Ater, a minute species of Ips found in England by Mr. Kirby, and described by Mr. Marsham, Ent. Brit. It is subhyaline and black; thorax dotted with imprefed points, and carinated along the middle; wing-cases with crenate frize; folies of the feet pitchy black.—General colour black.

Ater, in Natural History, a species of Anguis or snake. It inhabits Ceylon; black, faciated with white, and the scales tipp’d with black. Lar. Amp. This is amphibius colonica; femina of Seba; and anguis ater, black-banded flow-worm of Dr. Shaw.

Ater, a species of Limax, (slug or snail), the body of which is black and ruged. Müll. Gmel. Of this kind there are several varieties; the first (1) is black, and pale beneath; it is figured by Litter, exerat. nat. tab. iii. f. 1.—5, and is probably cochica mida of Gfnn. The second variety (2) is black, with a pale greenish dorfol ridge. The third (7) is described by Swammerdain; it is Vol. III.

black above, white beneath, and the mouth yellowish. The fourth (3) is limax subrubus of Litter; the colour of which is chestnut-brown above, white beneath, and mouth yellow. The fifth kind is of an obscure brown, with a yellowish mouth and fraenk on each side.

These are found in woods, meadows, and gardens. The length is from an inch and four lines to five inches. The feelers are black in all; the sheld rough, with many punctures; back and belly little furrowed or wrinkled.

Ater, in Ornithology, a species of Falco that inhabits Europe. The cere and legs are yellow, body above brownish black; and the head, white; tail forked. Gmel. This is a kind of kite, and is somewhat smaller than the common species, milvus. Buff. calls it milvus niger; Buff., milvus noir; and Cramer, brunnerus davicygerus. It is also the black gleed of Sibbald, and black kite of Latham.

Ater, a species of Pitracus, of a black colour, glossed with green, with bill and eyes red, and yellow legs. This is the black maccaw of English writers; ara noir; and ara amara on maclao de la certa, &c. It lives about the summits of the dry mountains and rocky places in the interior parts of Guiana, and in that respect differs from the other kinds of macaws found in that country. Buffon speaks of it as a species well known to the inhabitants of Guiana, but had never seen it; and observes, that though the plumage is black, it is so blended with green, that in the full shine it has a most splendid appearance.

Ater, the Gmelian specific name of the crested black cuckow of Latham; a kind of *Cuculus*, with a wedge-shaped tail; body palinard, black; feathers of the head elongated into a crest; and the frill five quill-feathers white at the base. This bird is a native of Africa, being found at the cave of Good Hope, and is conjectured may be only a variety of *cuculus ferratus*.

The length of this kind is twelve inches; the bill an inch and a quarter in length, and rather incurvated. Buffon says in his specimen, the tail feathers are not regularly cincated. The same author fupposes his Jacobin huppe de Coromandel, or Coromandel crested cuckow, to vary only through the difference of climate.

Ater, a species of Parus, that inhabits the woods of Europe and North America; and is known in England by the name of the coloume. The head is black; back cinereous; back of the head and breast white. Gmel. &c. The bill and chin of this bird are black; vent, reddish; quill and tail feathers brownish-ail; legs and clawed-coloured.

Ater, a species of Parus, called in England the Coloume. It is smaller than the blue titmouse, and is pretty common in woods, orchards, and gardens; feeds on insects, and lays a number of eggs. This bird is found throughout Europe, and inhabits likewise Siberia, and some parts of North America. Linnaeus (Fa. Suec.) describes it specifically as having the head black; back cinereous; hind-part of the head and breast white. Scop. Cram. Gmel. &c. This is parus atricapillus, la mafage a tete noire of Brifon, av. et la petite charbonniere of Buffon; Frisch calls it kohletefe.—General description. Length four inches; weight two drachms; bill black; throat, as well as the head, of the same colour; from the bill, on each side, a broad band of white passing just under the eye to the sides of the neck; between the breast and vent, rufous white; wing-coverts grey, tipped with white, forming two bands of that colour; quill and tail feathers brownish-ail, bordered with grey; tail rather forked; legs and claws head-colour.

**A T E G A T I S** or *Atargatis*, called also *Diraco*, in *Mythology*,...
A T E

Mythology, a goddess of the Syrians, supposed to be the mother of Semiramis. She was represented with the face and breasts of a woman, but the rest of her body resembled a fish. Volusius says the term signifies without fish, and conjectures that the votaries of this deity abounded from fish. According to Antipater, the philo-philosopher of Tarfus, in his treatise on superition, Atergatis is compounded of Ater, without, and Gatis, the name of a Syrian queen, who being very fond of fish, forbade the use of it to her subjects; and the Syrians, it is said, did not eat fish. Fabulous reports say, that Atergatis was taken with her son Ichthys, by Mopsus king of Lydia, who drowned them both in a lake near Acalon, where they were devoured by fish; and hence, it is added, proceeded the horror of the Syrians against this sort of aliment. Atergatis, styled Derectus, says Bryant (Anal. Am. Myth. vol. ii. p. 298.), is a compound of Ater or Aser, the name as On and Oiris, an Egyptian deity, and of gatus or catus, rendered also by the Ionians, a fish. Dagon, Sidon, and Derectus, were all names of the same hieroglyphic, and related to the person called Oanes by Berosus and others, and also to the machine wherein he was preferred. He lived both before and after the flood; he was represented at Babylon with two heads and in other places he was differently exhibited. The meaning of which, according to this writer, was this, that though Oanes was really a man, yet he was typically esteemed an animal of the sea; and on that account they represented him with the skin and scales of a catus or fish. All these characters were originally taken from hieroglyphics in Babylonia; they relate to the same history, and to one particular person who had escaped the waters when the earth was overwhelmed; and through whom arts and sciences were supposed to have been renewed in the world. Semiramis, whom the generality of hiltorians have represented as a great prince who reigned in Babylon, is described by other writers as a deity. Thus Athenagoras (Legatio, p. 307.) says, that "the Syrens worshipped Semiramis;" and he adds, "that she was esteemed the daughter of Derectus, and the fame as the Suna Des." Dio.Crusio afo. (l. ii. p. 92.) makes her the daughter of Derectus by Surus; but Surus, says Bryant, was the fun, and the Desura was Desa folaris. Hence many have confided Rhea, Isis, Allarz, Atergatis, and Semiramis, as one deity. Lucian, (De Suna Dea, vol. ii. p. 835.) tells us, that they were so esteemed by the Syrians of Hieropolis. According to Bryant, they were all different symbols relating to the same object. See Semiramis. It has been also supposed, that the Atergatis, or Derecto, of the proper Palefine in general, or of Acalon in particular, was the Babylonian or Assyrian Venus. To this purpose Strabo (l. xvi. p. 748.) says, that Atergatis was worshipped at Hieropolis, and he makes her the same with the Syrian goddesses. Others are of the same opinion (Phin. H. N. l. v. c. 23.) and among them Macrobinis in (Saturn. i. c. 23.) who fyles her the mother of the gods, Allarz, and the Hieropolitan or Assyrian goddesses. Upon the whole, we may observe, that Atergatis was Venus, Juno, Minerva, Allarz the Syrian goddesses, and consequently the celestial Venus of the Assyrians. So that we see here all the same goddesses transported from the banks of the Euphrates, into which she is said first to have plunged herself, in order to escape the inexorable Typhon (Min. Altron. iv.;) and but just varied so far as to leave room for each particular country to claim her origin. The Syrians, who seem to have received her first, and who were nearest to the place of her native abode, preferred her, it is likely, in the most genuine form; the Phenicians, who were next, altered her no farther than to make her a Phenician; and the Philistines, or Acalonites, who were a little farther off, that they too might make her their own, converted her into a monster, woman upwards and fish downwards; they allowing her to have been in subordination to some other goddesses, who had such power over her as to chastise her by a metamorphosis from her just shape. It appears, then, that the worship paid to this goddess was originally derived from Assyria and Babylonia, and was established in other countries by the prevailing power of these two empires. We may also conclude, that the celestial Venus of the Assyrians, Allarz of the Phenicians, and the Derecto or Atergatis of the later Philistines, were all derived from Semiramis, the first real or reputed foundress of Babylon; who seems to have been translated into the queen of heaven, the moon, as Belus or Pul, the first Assyrian monarch, was changed into the sun; that all the Jupiters and Junos, and the rest who are supposed to have been once mortal, or conversant on earth, are derived from this source; and that, on this Assyrian or Babylonian foundation, the whole superstructure of the Greek polytheism and idolatry was erected. For the Greeks had their religion from the Phenicians partly, and partly from the Egyptians, who derived theirs originally from the banks of the Euphrates and Tigris, as may be gathered from the religious state of the countries on either side of the Euphrates in the days of Abraham. The Egyptians, indeed, seem in process of time to have erected a sytem of their own, though not very widely different from the Babylonians; and the Phenicians, who had equally communication with the two nations, seem to have mixed both styles. See Idolatry, and Polytheism.

ATERIUS, a town of Italy, in Samnium, belonging to the Murrucini, situate on the sea coast at the mouth of a river of the same name, now called Piscara.

ATERRIMA, in Conchology, a species of Nerita, figured by Chemnitz. The shell is thick, opaque, globule, very black, with coloured lines; within white; exterior lip glabrous, inner one unbeculated. Gmel. &c. This kind is very minutely fricated, and its habitat unknown.

ATERRIMA, in Entomology, a species of Blatta, of a black colour, and dilatate of spots; the tarsi of the legs are white, knees brown, tarsus fuscous. Herb. This inhabits India.

ATERRIMA, a new British specie of Chrysomella, described by Mr. Marshall, Ent. Brit. It is black and shining; thorax highly glossy; wing-cages fricated; legs rather ferruginous.

ATERRIMUS, a species of Curculio, very common in Europe. This is black, with the wing-cages shining. Linn. Fa. Sc. Fabr. &c. Gmelin has also another species of Curculio under the same name; this is of an oblong form, and black colour, with rufous antennae. It inhabits Europe, and is presumed may be only a variety of Curculio chloropus.

ATERRIMUS, a species of Carabus, entirely of shining black, with a roundish thorax; wing-cages faintly fricated, with four excavated dots near the future. Herb. About half an inch in length.

ATERRIMUS, a species of Elater, found in the north of Europe. The thorax is glossy black; wing-cages black and fricated. Fabr. This is elater ater, thoracis opaco punctato clytris fratis of Linn. Faun. Succ.; and elater totus niger nitidus of Geoffroy.

ATERRIMUS, a species of Cimex, (Rotundatus Sec.) that inhabitations Spain. This infect is deep black, with half the wing-cages transparent. Forl. Nov. Inf.

ATERRIMUS, a species of...
ATHARIOUS, a species of SCARABEOUS (Cetonia). It is of a dull black, with obscure rufous spots on the wing-cases. Fabrarius. It inhabits the Cape of Good Hope.

ATHRIMUS, in Ornithology, the specific name of the great black Cockato of New Holland, a bird of a black plumage with a large and paler crest, and red naked checks. Gmel. This kind of Pittacus is called by Buffon kakatois noir; and is the great black Cockato of Edwards, Glean. t. 316.

ATFESTE, Este, in Ancient Geography, a Roman colony settled to the south-west of Patavium in the Venetian territory.

ATFIEH, or Etifieh, in Geography, a bough of Egypt, on the east coast of the Nile, 35 miles south of Cairo. It is situated at the foot of a mountain, upon a narrow cauiil, formed by a pretty large island. Some geographers have supposed that this town or village occupies the site of the ancient city of Venus, or Aphroditeopolis. N. lat. 30° 28'. E. long. 31° 5'.

ATFLOW, Eupen, in Biography, studied at New College Oxford, where he took his degree of Doctor in Medicine in 1566, and was in much repute as a physician, particularly among those of the Roman persuasion. He was imprisoned several months, Ant. Wood says, for corresponding with Mary queen of Scotland. The time of his death is not known.

ATH, ATTHA, or ATHE, among our Anglo-Saxon Anteflora, signifies an oath, especially that taken by way of profession. In this sense we meet with breaking of ath, privilege of ath, atha, and ordea.

ATH, in Geography, a town in the department of Jemmapes, or chief place of a canton in the district of Tournay; the place contains 7634, and the canton 14,628 inhabitants; the territory includes 115 kilometres, and 11 communes. See AETH.

ATHABASCA, RIVER, LAKE, AND COUNTRY, lie in the north-west part of North-America, in about N. lat. 58° 40', and W. long. 110° 40'. The Elk river is commonly called by the white people the Athabasca river, in N. lat. 56° 42'. In the territory that lies between the Peace river and the lake of the hills, as far as the Elk river, which is formed by the quantity of earth and mud that is carried down by the stream of these two great rivers, there are several lakes; the lake Clear Water, which is the deepest, lake Vassieu, and the Athabasca lake, which is the largest of the three, and whose denomination in the Kiffianke language implies a flat, low, swampy country, subject to inundations. The two last lakes are now so shallow, that, from the cause just mentioned, there is every reason to expect, that in a few years they will have exchanged their character, and become extensive fords. This country is so level, that at some feasons it is entirely overflowed; and this circumstance accounts for the periodical influx and reflux of the waters between the lake of the Hills and the Peace river. Till the year 1782, the people of Athabasca went or carried their furs regularly to Fort Churchill, Hudson's Bay; and some of them have since that time repaired thither. The present trading establishment is situated on an high bank on the north side of the river La Plune, in N. lat. 48° 37', where the people from Montreal meet those from the Athabasca country, and exchange furs with them. The traffic to Fort Churchill is now in a great measure discontinued, as the Chepewyan was obliged to expend in the course of the journey that ammunition which was its most alluring object. See CHEPENYAN. Mackenzie's Voyages, Introd. p. 56—59.

ATHABASCA is by some called ARATHAPSCOW, and ARATHAPSCOW, and ARATHAUSCOW.

ATHABOLI, or ACATPOLI, a town of European Turks, in the province of Romania, 68 miles north-east of Adrianou.

ATHAMADEUT, or AETHNADALEUT, the prince or chief minister in the Persian empire.

The atamadulet is much the same with the grand vizier in Turkey, except that he has not the command of the army, which the vizier has.

The atamadulet is great chancellor of the kingdom, president of the council, superintendent of the finances; and has the charge of all foreign affairs. He is in effect viceroy or administrator of the kingdom; he infees the king's mandates, or orders, in this style: "Bende derga ah it alta etmadulet," that is, "I, who am the support of the power, the creature of this port, the highest of all ports, &c."

ATHAMANIA, in Ancient Geography, a country of Greece, at the source of the river Acheclus, in Atolia, according to Polybius; but in Hirtius, according to Steph. Byz.

Some have made it a part of the Thessaly, and others of Epirus. According to Polybius, it was divided from Epirus by the bay of Ambracia; and according to Strabo, from Atolia, by the river Acheclus. M. D'Anville places Athamania between the chain of the Pindus to the east, and a parallel chain to the west. In the midst of this valley ran the river Avas. To the south of this country were the Molophi and Aparantes, to the east the Perserbei, and its capital was Argyaeae. At their commencement the Athamanians were a very inconconsiderable people; but they appeared with distinction in the wars of the Romans and Atolians against Macedonia, towards the year 197, B. C. Livy relates that the Atolians chose Ammianus, king of the Athamanians, for their mediator in their contentions with Philip, and that the Romans solicited his favour against this same Philip. Their dominion extended over the whole chain of the mountains of Epirus; and they seem to have subsisted at least a century before the war of Troy.

ATHANZ, a town of Arabia Felix. Pliny.

ATHANAGAIA, a town of Ilipanu exterior, and the capital of the Bergezi, according to Livy, who relates the manner in which this town was subdued by Scipio.

ATHANASIA, among the Ancient Physicians, an epithet given to a kind of antidotes supposed to have the power of prolonging life, even to immortality.

In the Anglican dispensation we shall find a medicine under the appellation of *athanoga magna*, commended against dyensitaries and hemorriages.

Species, 1. *fignegus*, crota-leaved athanasia, relhania squarrosa, L'Herit. Angl. n. t. 29. Peduncles one-flowered, lateral; leaves ovate, recurved. An underbri. Leaves alternate, sessile, pointed, smooth; peduncles axillary, longer than the leaves; chaff linear, the length of the florets. Introduced in 1774, by Maillon. 2. *fignegus*, flowered athanasia, *Relh. lateriflora*, L'Herit. peduncles one-flowered, shorter than the leaf; leaves linear, hairy. A very small plant, found at the Cape by Thunberg. 3. *pamila*, dwarf athanasia; *Relh. pedunculata*, L'Herit. l. c. Peduncles one-flowered, longer than the leaf; leaves linear, hairy. This is also a small Cape plant, discovered by Thunberg. 4. *crenata*, notched-leaved athanasia; flowers solitary, terminal; leaves linear. Stem thrubby; leaves alternate, obscurely three-cornered; one terminal flower. 5. *uinafa*, one-flowered athanasia; *Relh. communis*, L'Herit. l. c. Flowers solitary, terminal, sessile; leaves ovate, imbricate, smooth. A native of the Cape, discovered by Thunberg. 6. *decapita*, hairy athanasia; flowers terminal, sessile; leaves lanceolate, hirtate. This has the appearance of buplithalum capense, but the leaves are alternate; the flowers are difoid and fuculoes. A native of the Cape, and introduced in 1774, by Maillon. 7. *maritima*. (See SANTOLINA MARITIMA.) 8. *geminiflora*, broom-leaved athanasia; *Relh. genifi*. L'Herit. 60. Corymb simple; leaves lanceolate, undivided, naked, crowd- ed. Stem underbriby; leaves sessile, marked with very short lines, smooth, somewhat keeled, bluntish; coryms small, with three or four subsidente flowers. 9. *pubescens*, villos-leaved athanasia; *coryms simple; leaves lanceolate, undivided, villosa,*. This rises five or seven feet high. Flowers yellow. 10. *annua*, annual athanasia; *coryms simple, contracted; leaves pinnatifid, toothed*. Root annual; item about nine inches high, branched at the top; leaves smooth, cut into segments like those of buck's horn plant; flowers of a bright yellow, large. Cultivated by Miller in 1768. (8.) *Achillea inodora*, Lin. Sp. Pl. 11. A. trifurcata, trifid-leaved athanasia; *coryms simple; leaves three-lobed, cuneiform.* Shrubby; five or six feet high; leaves

common in many parts of Sweden, Denmark, &c. 2. *A. cuneifolia*, broad-leaved spigged, or black last-root. Jacq. Aut. t. 6. 69. "Leaves pinnate, dentislated, gauz-angled; feeds naked." Root perennial; stem five feet high, firm branching; leaves glaucous, smooth, with black veins underneath, and six pairs of pinnae. Most of the leaves are sessile, elliptical, acuminate, toothed; corolla white, with a purple outline. A native of the mountains of France, Switzerland, Germany, &c. 3. *A. fibrizae*, Siberian spig- nel. Gmel. Sib. 1. 186. 3 4. 27. 1. 2. "Leaves pin- nate, gauz-angled." The descriptions of this plant by Lin- nes, Geanu, and Scopoli, are loo widely different, that we cannot even suppose they mean the same plant. 4. *A. crenata*, three-leaved spigled. "Leaves sub- pinnate; leaflets imbricate downwards; umbel less-form." Root perennial; stem ample, a foot high, angular, furrowed; leaflets alternately pinnatifid; umbel very close, convex on both sides, placed on branches arising at the axis. A native of Siberia. Introduced in 1775, by the earl of Bute. 5. *A. Oreoferum, Divisarum spigled; "leaflets divaricate," Root perennial; leaves very large, firm, smooth, triply pinnate, divided at right and left oblique angul; divisions broadish, not toothed, but two or three; lobed; stem two feet high; petals white, with a bluish ruffle colour. A native of Germany, Sweden, France, &c. 6. *A. ficula*, six-weed-leaved spigled. "Leaves linear, pinnatifid, and sessile, sessile; feeds hairy." Root perennial; stems nearly three feet high. The umbels at their first appearance are very compact, but afterwards spread open and divide into several small umbels. The flowers are white, and succeeded by oblong woody fruit. A native of Sicily. Cultivated in England in 1713. 7. *A. ctenis, Cretan spigled or candy carrot, Jacq. Aut. t. 62. "Leaflets linear, flat, hirtute; petals two-parted; feeds oblong, hir- fute." The whole plant in its wild state is villose; when cul- tivated it becomes succulent, brittle, and very thinning; stem broken; leaves tripinnate; pinnales deeply two or three- parted. The universal involucre conflits of five, the partial of from four to seven leaflets; petals white. A native of the south of Europe, flowering in June. The seeds have been medicinally employed for the same purpose as those of wild carrot (see Daucus). 8. *A. anna*, annual spigled. "Leaves many-parted, divisions linear; roundish, acuminate." It is a native of Canadia, or Creta, and was introduced in 1775, by Mons. Richaud. 9. *A. thunbergii*. "Seeds mem- branaceous, fibrated; leaves superdecipomund, polished, multifid." Stem angular, smooth; leaves like those of charophyllum, and smooth; umbel not much expanded. A native of China. 10. *A. rpaperiis*, Engl. Daub. 2. 618. "Leaflets bristle-shaped, recurved, smooth; all the flowers fertile." Stem eighteen inches high; branching, finely furred; leaves bipinnate; universal involucre two, partial many-leaved; petals white; feeds downy. A native of Chamola and Dauphine. Villars supposes this to be a variety of the seventh species.

Propagation and Culture. All these plants are propagated by seeds, which should be sown in a bed of light dry ground in autumn, and in the following spring planted at a foot from each other, in a bed of light sandy earth, where the roots will continue several years, except the eighth species, which is an annual. The theb has not yet been cultivated in Eng- land, and will probably require shelter.

 Athamanta. See Athusa. Meum.

ATHAMAS, in Entomology, the name given to a spe- cies of Papilio in Drury's Inf. that inhabits India and South America. It is Papilio *Pyrrhus* of Linnaeus and Fabricius. See Pyrrhus.
ATHANASIUS CREEED. See CREEED.

ATHANASIUS, Saint, in Biography, a celebrated Christian bishop, flourished in the fourth century, and was a native of Egypt, probably of Alexandria. Hilory has transmitted to us no records of his parentage, nor of the precise time and place of his birth. The attention of his early years seems to have been principally devoted to theology; and having engaged in the service of the church, he was ordained a deacon by Alexander, bishop of Alexandria, whom he served as secretary, and accompanied to the council of Nice, and whom he succeeded in the year 326, in consequence of his special nomination, and by the general suffrage of the people. At this time he was probably about 30 years of age, for he speaks of the perdition of Maxentius as an event which he had been informed of by his fathers, and he lived 45 years after his episcopal ordination. Having distinguished himself at the Nicene council, though then only a deacon, by a violent speech against Arius, he was no sooner advanced to the proecacy than he became a more zealous and powerful advocate in the cause of the Catholics against the Arians. Not content with reviling them and their opinions in the most opprobrious terms (see Arians), he employed his talents and influence in refuting and uprooting them. The Arians, on the other hand, were equally abusive and active in counteracting the holy efforts of the orthodox prelate, in reproaching his character, and in subverting his episcopal authority. As Athanasius could be induced, neither by the requisition of the emperor Constantine, nor by the menace of Eusebius bishop of Nicomedia, to acquiesce in the admission of Arius to the communion of the Catholic church, from which he had been excluded, the friends of the latter used all the means they could devise for disgracing and removing their adversary. Accordingly, in the year 331, they brought several accusations against him before the emperor. The prelate, after much hesitation and reluctance, was at length obliged to obey the emperor's peremptory commands, and to appear before a council of 60 bishops summoned at Tyre, in 335. Some of the charges that had been alleged against him were satisfactorily confuted; but others were confirmed. During the progress of the inquiry and trial, some members of the synod received Arius into communion at Jerusalem; and Athanasius himself seized an opportunity that occurred of failing for Constantinople, to insect an audience of the emperor. In consequence of this audience, the members of the council were summoned to appear before Constantine, that the cause might be fairly examined; but when they arrived, instead of renewing their former accusations, they produced a new charge, alleging that Athanasius had attempted to detain at Alexandria the ships which supplied Constantinople with corn, of which they were then in want. Upon this the emperor, from resentment, conviction, or policy, confined to his degradation; and the council pronounced against him a sentence of deposition and banishment. The place of his exile was Treves in Gaul; and here he remained, according to the most probable account, about 18 months. Upon the death of Constantine, Athanasius was restored by an honourable edict of Constantius to his country and to his episcopal see. This proceeding was represented by the Arians as an offence against syro-drical authority; and a council of 99 bishops was held at Antioch in 341, by whom the former deposition of Athanasius was confirmed, and Gregory of Cappadocia, one of their own party, placed in the see of Alexandria. The young emperor confirmed the nomination, and Athanasius was constrained to fly for protection and support to Julius, bishop of Rome. At the end of three years he was sent to Milan by the emperor Constan, who was disposed to favour the Catholic party. A new council was appointed to be held at Sardica in Illyricum in the year 347, to settle the subjects in dispute. The calumn and western bishops disagreed and separated; the latter, who were the partisans of Athanasius, remained at Sardica; and the former assembled at Philippopolis. One
perty regarded him as a saint; and the other represented him as a wicked disturber of the peace of the church. Constantius, however, was intent upon reforming him, and consequently demanded it of his brother Conantius; which he refused, and went to war in case of non-compliance. Conantius submitted, and solicited the return of the exiled prelate to take possession of the Alexandrian see, which was now become vacant by the death of Gregory. The bishop's zeal for the catholic doctrine of the trinity was not in the least abated by all the reverses of his condition; for in his progress through the various cities that lay in his way to Alexandria, he admonished the people to avoid the Arians, and to admit into their communion none but those who adopted their creed the word "confessional." In the year 359, he arrived at Alexandria, and was welcomed by his old friends and adherents with every exposition of joy: and from this time he enjoyed a short interval of repose. The death of the emperor Constant, and of pope Julius, to whom he was closely indebted for his restoration, threatened him with new dangers. Conantius was his determined enemy, and he summoned a general council at Arles, in the year 353; and in this council the Ariants prevailed, and all the bishops present, with one exception, signed the condemnation of Athanasius. As Libanius, the successor of pope Julius, was disaffected with the proceedings of this council, another was held at Milan in the year 355. Here the emperor exercised his utmost influence, and at length a majority of 300 bishops concurred in the condemnation of Athanasius, and those who refused were exiled by the authority of the emperor. The sentence of these councils, however, was cautiously executed by Conantius. The prelate was persuaded voluntarily to abdicate his see; but he remained inflexible, notwithstanding all the measures that were used for this purpose. During thisinterval a body of soldiers appeared in the midst of Alexandria, and at midnight they invaded the church in which the bishop and his attendants were performing their devotions preparatory for the communion. In this moment of confusion and terror, the prelate remained firm and intrepid, calmly expecting death, and animating the youth of his flock by ordering a psalm of praise to be sung. At length the congregation dispersed, and the bishop was conveyed through the tumultuous crowd to a place of safety. The see of Alexandria was bestowed by the emperor upon George of Capadocia, a zealous supporter of the Arian cause; and Athanasius was proscribed, with the promise of a large reward to any one who should produce him dead or alive. The perfected prelate disappeared, and remained for six years in imprisonable obscurity. The place of his retreat was the desert of Theba's; and among monks or hermits anxious to preserve him from the search of his enemies, he found an un molested asylum. From this retreat abode he is said to have sometimes extended his excursions in disguise to visit his confidential friends at Alexandria. Hence he also addressed his enemies with invective, and his friends with consolatory admonitions by his writings. The accession of Julian, who succeeded Conantius in 361, and the death of George, bishop of Alexandria, who was in the same year killed in a tumult, opened the way for a third return of Athanasius to the see of Alexandria. With unabated zeal for the Catholic faith, and particularly for the doctrine of the trinity, he summoned a council at Alexandria, at which it was determined that the Arian bishops, who recanted their errors, and signed the Nicene creed, might be received to the communion of the church, and restored to their fees. However, Athanasius's repose and influence were of short duration. The emperor Julian regarded him with peculiar aversion; and in order to avoid the threatened tokens of his displeasure, the prelate was obliged again to seek an asylum in the monasteries of the defect. While with this view he was removed from his see, and his enemies followed him; but as soon as the prelate was informed that they had orders to apprehend him, and knowing that he must soon be overtaken, he instructed the mariners to turn about the boat and meet his pursuers. Having no supposition that Athanasius was on board, they protected their voyage, and the prelate escaped to Alexandria, and concealed himself till the death of Julian in the year 363. Upon the accession of Jovian, Athanasius once more resumed his episcopal function, and under the patronage of the emperor, the Nicene creed became the general formula of the churches. After the short reign of Jovian, Valens succeeded to the eastern division of the empire; and as he had adopted Arian principles, he inflicted edicts for banishing the bishops who had regained their fees under Jovian; and Athanasius was again in the number of those who were protected. The efforts of his friends at Alexandria were exerted in his favour; but whilst they were preparing to defend him by force, he thought it most prudent to retire; and on this occasion, which has been denominated his fifth exile, he concealed himself for four months in the monument belonging to his family. The emperor relinquished the contest; and the venerable prelate closed his days in tranquillity in the 46th, or as some say in the 48th year of his prelacy, and in the year of Christ 373. It is not easy to form a just estimate of the talents, learning, and character of Athanasius, amidst the adulation of his friends, and the reproaches of his enemies. "The immortal name of Athanasius," says Mr. Gibbon, "will never be separated from the Catholic doctrine of the trinity, to whose defence he consecrated every moment and every faculty of his being." Amidst the fraught pernicious persecution, he was patient of labour, jealous of fame, careless of safety; and though his mind was tainted by the contagion of fanaticism, Athanasius displayed a superiority of character and abilities which would have qualified him, far better than the degenerate sons of Constantinople, for the government of a great monarchy. His learning was much less profound and extensive than that of Eusebius of Cæsarea, and his rude eloquence could not be compared with the polished oratory of Gregory or Basil; but whenever the prince of Egypt was called upon to justify his sentiments or his conduct, his unmeditated style, either of speaking or of writing, was clear, forcible, and peremptory. He has always been received in the orthodox school as one of the most accurate masters of the Christian theology; and he was supposèd topossess two profound sciences less adapted to the episcopal character, the knowledge of jurisprudence, and that of divinity. Some fortunate conjunctions of future events, which impartial reasoners might ascribe to the experience and judgement of Athanasius, were attributed by his friends to heavenly inspiration, and imputed by his enemies to infernal magic. But as Athanasius was continually engaged with the prejudices and passions of every order of men from the monk to the emperor, the knowledge of human nature was his first and most important science. Athanasius was capable of distinguishing how far he might boldly command, and where he must VOL. III. 23.
of his behaviour conciliated the affections both of the clergy and of the people. The Alexandrians were impatient to rise in arms for the defence of an eloquent and liberal pastor. In his distress he always derived support, or at least consolation, from the faithful attachment of his parochial clergy; and the hundred bishops of Egypt adhered with unshaken zeal to the cause of Athanasius. In the modest equipage which pride and policy would affect, he frequently performed the episcopal vitation of his provinces, from the mouth of the Nile to the confines of Ethiopia; familiarly conversing with the meanest of the populace, and humbly faulting the faults and hermits of the defect. Nor was it only in ecclesiastical assembles among men whose education and manners were similar to his own, that Athanasius displayed the affability of his genius; he appeared with easy and respectfull forms in the concourse of princes; and on the various turns of his prosperous and adverse fortune, he never lost the confidence of his friends, or the esteem of his enemies.

The works of Athanasius were numerous, and consisted chiefly of apologies for himself, or invectives against his enemies, or controversial treatises against Ariusism. His style is clear, easy, and not destitute of dignity and ornament. In his reasonings he is sufficiently copious; and in his attacks upon the Arians more than sufficiently acrimonious. The more valuable of his genuine writings are his first book "Against the Gentiles"; "Apologies"; "Letter to those that lead a Monastic Life"; "Letters to Serapion"; "Two books on the Incarnation"; "Conference with the Arians"; "The life of St. Antony"; and "The Abridgment of the Holy Scriptures." The latter of these pieces contains an enumeration of all the canonical books of the Old and New Testament, with a summary of their contents, and an account of their respective authors; and it treats particularly of the four gospels. This "Abridgment or Synopsis of the Holy Scriptures" has been reckoned genuine by some; but it is supposed by others to have been falsely ascribed to him, and in the Benedictine edition of his works, it is rejected. His "Feltal or Paelatical Epistle," which is generally allowed to be genuine, contains several valuable testimonies in favour of the sacred books now received as canonical. Dupin, and also Cave, have diligently enumerated both the genuine and forgerous works of Athanasius. For an account of the creed that has been called Athanasian, see Creed. The works of Athanasius were first printed only in a Latin translation, and in an imperfect state by Calvinus, at Vincenza, in 1482; and enlarged editions appeared at Paris, in 1520; at Rome, in 1523; at Cologne, in 1532; at Belf, in 1558; and at Paris, in 1608. The Greek text was first published in 2 vols. fol. by Comeldinus, at Heidelberg, in 1601; and at Paris, in 1627. The best edition was printed in 3 vols. fol. by a learned Benedictine, Bernard de Montfaucon, at Paris, in 1698. This was reprinted with improvements, and an additional volume, at Padua, in 1734. 4 vols. fol. Sozomen, E. H. Sozomen, E. H. Cave Hist. t. i. p. 138. &c. Dupin. Fahl. Bib. Græc. l. v. c. 2. Gibbon's Hist. vol. iii. p. 322—325. vol. iv. p. 131—228—267. Lardner's Works, vol. iv. p. 285. &c.

ATHANATI, an order of soldiers among the ancient Persians.

The word is Greek, and signifies immortal; being compounded of the privative a. and sou, death.

The athanati were a body of cavalry, confining of ten thousand men, always complete, because when any one of them died another was immediately put into his place.—It was for this reason that they were called "athanati" by the Greeks, by the Latins "immortales."
given by Mose to the Israelites, on account of its excellent pasturage. Numb. xxxvii. 34. — Allo, a town of Samaria, in the tribe of Ephraim, four miles north of Sebaste or the city of Samaria; called by Jerome, Atharus; and another on the frontiers of Ephraim, between Janothe and Jericho, John. xvi. 7, probably the same with Aitaroth-Addar, mentioned 15, x. xviii. 13.

ATHIOY, in Geography, a market and port-town in the county of Meath, and province of Leinster, in Ireland, which, before the union, sent two members to the Irish parliament. At its weekly market, there has been a good deal of corn sold of late years; some yarn and merchandise for the peasantry. It is situate twenty-eight Irish miles N. W. of Dublin. Thorn-

ATHEE, in Geography, a town of France in the department of the Mayenne, and chief place of a canton in the district of Cram, three miles north of Cram.

ATHIST, derived from the privative α, and ὄν, God, a person who does not believe the existence of a God, nor a Providence; and who has no religion, true or false. In general a man is said to be an atheist, who owns no being, superior to nature; that is, to men, and the other sensible beings in the world.

In this sense, Spinoza may be said to be an atheist, and it is an impropriety to rank him, as the learned commonly do, among deists; since he allows of no other God beside nature, or the universe, of which mankind makes a part; and there is no atheist but allows of the existence of the world, and of his own existence in particular. See Spi-

NOZA.

Plato distinguishes three kinds of atheists. Some, who deny, absolutely, that there are any gods; others who allow the existence of gods, but maintain that they do not concern themselves with human affairs, and so deny a Providence; and others, who believe there are gods, but think they are easily appeased, and that they may remit the greatest crimes for the smallest supplication.

The learned Cudworth (Intellectual System, b. i. c. 3, vol. i. p. 104—178.) reduces the ancient atheism of the Greek philosophers into four different forms, comprehending the two classes of hylozoics or hylopathics, and atomical or atomists, under the denominations of Anaximandrian, Democritian, Stratoniccal, and Stoical. The Anaximandrians attempted to solve the phenomena of nature by having recourse to the unmeaning language of qualities and forms. These were contained actually or potentially in that infinite chaos of matter, delitute of all understanding and life, which was the first principle or only real name of Anaximander; and by their fortuitous secretion and segregation, they produced, first, the elements of earth, water, air, and fire, and then the bodies of the sun, moon, and stars, and both the bodies and souls of men and other animals; and, lastly, immeasurable and infinite such worlds as these, as so many secondary or native gods. (Plato De Leg. l. x. p. 666. See Anaximander, and Anaximandrians.)

Some have called this scheme of atheism, which deduces all things from matter by means of qualities and forms, Peri-

patetic or Aristrocles, because Aristotle used this kind of language in his physiology. But as Aristrocles cannot be justly denominated an atheist, Cudworth distinguishes this form of atheism by the appellation of Anaximandrians. Democritus and Leucippus new-modelled atheism from the Anaximandrian and Hylopathian into the atomic form, and derived the original and production of all things from atoms, devoid of all forms and qualities, and poiffessing only, as first principles, magnitude, figure, site, and motion; and as they conceived that life and understanding, and other qualities, could be only accidental and secondary results from certain fortuitous secrations and conceptions of atoms, they excluded a deity, and every thing like counsel and design from the formation of the universe. The Epicureans borrowed many of their notions from Democritus, and framed a system very much resembling the atomical, or Democritian. See Democritus, and Epicurus. The Stratoniccal atheism was of the hylozoic kind; and was so called from Strato Lampacenus, who acknowledged no other deity than a certain rapid and pulsive life, belonging to all the parts of matter, by means of which they arranged and framed themselves, without reflection. See Strato. The Stoical, or Pseudo-Stoical, or cosmosphatical atheism, adopted by several of the Stoics, suppos'd a certain kind of pulsive and perpetual, or methodical and artificial nature, without sense of conscious understanding, to prejudice over the whole world, and to dispose and preserve all things in that regular order which they assume and maintain. Some of the Stoics conceived that this pulsive nature, or spermatic principle, was subordinate to a sentient and intel-

lectual nature, or corporeal soul and mind of the universe, that presided over it; and this seems to have been the genuine doctrine of Heraclitus and Zeno; whilst others rejected the latter principle, and maintained, that the pulsive or spermatic nature, devoid of all animality or conscious in-

telligence, was the highest principle in the universe. All the ancient atheists agreed in this, viz. that there was nothing but matter or body in the universe; whilst some thought it animate, and were called hylozoics; and others thought it inanimate, and were denominated atomici. Hobbes seems to have inclined to the opinion of the Stratonicals; for he supposes (Phys. c. 25, § 5.) that all matter, as matter, is endowed not only with figure and a capacity of motion, but also with an actual sense or perception, and wants only the organs and memory of animals to express its sensation. Sir William Temple, according to the account given of him by bishop Burnet (Hist. Time, vol. i. p. 531, 8vo.) thought that the prent system of things is necessary and eternal. The Chinese have been represented as a nation of atheists. Accordingly Burnet (ubi supra) states it as the opinion of Sir W. Temple, that Confucius and his followers are to be reckoned among those who were atheists themselves, and left religion to the people. But Couplet maintains, that Con-

fucius and the earlier teachers among the Chinese, were votaries to pure religion. Confucius, however, says little of those duties that relate immediately to God; and though he speaks of the great spirits in heaven and earth, what he says concedes merely with the notion of a pulsive power, similar to that maintained by some of the Grecian philoso-

phers.

Some distinguish speculative atheists, or those who are so from principle and theory—from practical atheists, whose wicked lives lead them to believe, or rather to wish, that there were no God.

Dr. Clarke (Demonstration of the Being of a God, p. 2. 8vo.) says, that atheism arises either fromupid ignorance, or from corruption of principles and manners, or from the reasonings of false philosophy; and he adds, that the latter, who are the only atheistical personages capable of being recog-

nized with at all, must of necessity own, that, supposing it cannot be proved to be true, yet it is a thing very desirable, and which any wise man would wish to be true, for the great benefit and happiness of man, that there was a God, an intelligent and wise, a just and good being, to govern the world. Whatever hypothesis these men can possibly frame, whatever
A T H

whatever argument they can invent, by which they would
exclude God and Providence out of the world; that very
argument, or hypothesis, will of necessity lead them to this
conclusion. If they argue, that our notion of God arises
not from nature and reason, but from the art and contrib-
ution of politicians; that it is necessary to force them to con-
clude, that it is manifestly for the interest of human society,
that it should be believed there is a God. If they suppose
that the world was made by chance, and is every moment
subject to be destroyed by chance again; no man can be so
abird as to contend, that it is as comfortable and desirable
to live in such an uncertain state of things, and to continually
behold to ruin, without any hope of renovation; as in a world
that were under the preservation and conduct of a powerful,
wise, and good God. If they argue against the being of
God, from the faults and defects which they imagine they
can find in the frame and constitution of the visible and ma-
terial world; this supposition obliges them to acknowledge,
that it would have been better the world had been made by
an intelligent and wise Being, who might have prevented all
faults and imperfections. If they argue against Providence,
from the faultiness and inequality which they think they
discover in the management of the moral world; this is a
plain condition, that it is a thing more fit and desirable
in itself, that the world should be governed by a just and
good Being, than by mere chance or unintelligent necessity.
Lastly, if they suppose the world to be eternally and neces-
sarily self-existent, and consequently that every thing in it is
established by a blind and eternal fatality; no rational man
can at the same time deny, but that liberty and choice, or
a free power of acting, is a more eligible state, than to be
determined thus in all our actions, as a done is to be moved
downward, by an absolute and inevitable fate. In a word,
which way sooner they turn themselves, and whatever
hypothetical make, concerning the original and frame of
things, nothing is so certain and undeniable, as that man,
considered without the protection and conduct of a superior
Being, is in a far worse case; than upon supposition of the
being and government of God, and of man's being under
his peculiar conduct, protection, and favour. Nevertheless,
abridgment is as is the psalm of atheism, Diogenes
and Theodorus among the ancients, and Vonins among the
moderns, have been reckoned martyrs for it. Mr. Bayle
has pretended to prove, that it is better to be an atheist
than an idolater; or in other words, that it is less dangerous
to have no religion at all than a bad one. "I had rather,"
said he, "it should be said of me, that I had no existence,
than that I am a villain." This, as Montesquieu (Sp. of
Laws, vol. ii. p. 145.) justly observes, is only a sophism,
-founded on this, that it is of no importance to the human
race to believe that a certain man exists, whereas it is ex-
tremely useful for them to believe the existence of a God.
From the idea of his non-existence, immediately follows that
of our independence; but if we cannot conceive this idea,
that of disobedience. To say that religion is not a re-
straining motive, because it does not always restrain, is
equally absurd as to say that the civil laws are not a re-
straining motive. It is a false way of reasoning against
religion, to collect in a large work a long detail of the evils
it has produced, if we do not give at the same time an
enumeration of the advantages which have flowed from it.
Was it of no advantage for subjects to have religion, it
would still be of some if princes had it, and if they whitened
with steam the only rein which can restrain those who fear
not human laws. A prince who loves and fears religion is a
lion, who stoops to the hand that strokes, or the voice that
appeals him. He who fears and hates religion is like the
VOL. III.

fearful beast that grows and laces the chain which prevents
his flying on the passenger. He who has no religion at all
is that terrible animal, who perceives his liberty only when he
seizes in pieces, and when he devours. The question is not to
know, whether it would be better that a certain man or a cer-
tain people had no religion; to know what they have; but
to know which is the least evil, that religion he sometimes aban-
doned, or that there be no such restraint as religion on mankind.

Cicero represents it as a probable opinion, that they who
apply themselves to the study of philosophy believe there
are no gods.—This must, doubtless, be meant of the aca-
demic philosophy, to which Cicero himself was attached, and
which doubted of every thing: on the contrary, the New-
tonian philosophers are continually recurring to a Deity,
whom they always find at the end of their chain in natural
causes. Some foreigners have even charged them with
making too much use of the notion of a God in philosophy,
contrary to the rule of Horace—

"Nee Deus interit, mih dignus vint e ne res."—

Among us, the philosophers have been the principal ad-
voeates for the existence of a Deity. Witness the writ-
ing of Sir Isaac Newton, Boyle, Ray, Cheyne, Newcunty,
&c. To which may be added others, who, though
the clergy (as was also Ray), yet have distinguished
themselves by their philosophical pieces, in behalf of the
existence of a God; e.g. Derham, Bentley, Whiston,
Samuel and John Clarke, Fenelon, &c. So true is that
faying of Lord Bacon, that though a smattering of phi-
losophy may lead a man into atheism, a deep draught
will certainly bring him back again to the belief of a God
and Providence. See God, Providence, and Religion.

ATHELING, among our Saxon ancestors, was a title
of honour properly belonging to the eldest son of the
reigning prince, or the preeminent heir of the crown.
The word is formed from the Saxon atheling, of athe-
l, noble. It is sometimes also written, adeling, edeling,
etheling, and eathing.

King Edward the Confessor, being without issue, and
intending to make Edgar, to whom he was great uncle by the
mother's side, his heir, first gave him the honourable ap-
pellation of atheling.

Antiquaries observe, that it was frequent among the Sau-
xons to annex the word ling, or ing, to a Christian name,
only the fon or younger; as Edmundling, for the fon of
Edmund; Edgeling, for the fon of Edgar; and, accord-
ingly, some have thought atheling might primarily import
the fon of a nobleman, or prince: and Sir Henry Spelman
observes, that all noblemen had anciently been called Ath-
dingi: however, from a passage in the laws ascribed to Ed-
ward the Confessor, it appears, that in his times, and for at
least a century afterwards, this word was appropriated to
the royal family by the English. In reality, atheling, when
applied to the heir of the crown, leems rather to denote a
person endowed with noble qualities than the fon of a
nobleman; and corresponds to the nobilis Cesar among the
Romans.

ATHELNEY, islo of, in Geography, a spot of rising
ground, on the north side of Stanmore, in the county of
Somerset, about one mile E.N.E. of Taunton bounded
on the north-west by the river Tone; on which is a wooden
bridge, still called Athelney bridge. The name given by
the Saxons to this island was Athelinga 1275, or the isle of
noble, whence was derived, by contraction, Athelney. It
was formerly surrounded by almost impassable marshes
and morasses, and will be for ever memorable for the retreat
of king Alfred from the fury of the Danes, when they had
overrun the eastern part of his dominions. Having bravely

B h encountered
encountered his enemies for nine successive years, according to the statement of the register of Atheneb, he was at length reduced to the necessity of seeking refuge from their violence in this little island. After he had left this retirement, and his enemies were totally defeated, he founded a monastery for Benedictine monks, on the spot which had given him shelter, and dedicated it to the honour of St. Saviour and St. Peter the apostle, and endowed the establishment with the whole isle of Atheneb (amounting to about two acres of firm land), exempt from taxes and all other burdens. In proofs of time other privileges and benefactions were conferred on the monks, and confirmed by different kings and nobles.

ATHELSTAN, in Biography, king of England, was of illegitimate birth, and yet, being of mature age and capacity, succeeded his father Edward the elder, in preference to his lawful children, in the year 925. Soon after his accession, he marched to Northumberland in order to quell some commotions among the Danes, and conferred the title of king on Sithric, a Danish nobleman; but, upon the death of Sithric, when his two sons Arlaf and Godfrid, or Guthfrid, assumed the regal authority without his consent, he expelled them both; one taking refuge in Ireland, and the other in Scotland. The protection afforded to the latter by Constantine, king of Scotland, brought on a war, which terminated so much to the disadvantage of Constantine, that he was obliged, for the preservation of his crown, to do homage to Athelsthan. Hobilities, however, were renewed; and a confederacy was formed by Constantine, Arlaf, and some Welsh princes, whose united forces were totally defeated by Athelstan, at Bramanburgh in Northumberland, A.D. 938. In consequence of this victory, the king of England enjoyed his crown without molestation; and having governed the kingdom with great ability, he died at Gloucester in 941, after a reign of sixteen years, and was succeeded by his brother Edmund. In this reign commerce was greatly encouraged, and a law was passed, conferring the rank of thane, on every merchant who had made three sea-voyages on his own account. Athelsthan, with a view of further facilitating and promoting commerce, established a mint, or mints, in every town in England that had any considerable foreign trade, so that the merchants might have an opportunity of converting the bullion which they brought home for their goods into current coin, without much expense or trouble. These towns were London, Canterbury, Wincheller, Rochester, Exeter, Lewes, Hasting, Chichester, Southampton, Warcham, and Shaffebury. By thefe and similar regulations the shipping and feamen of England were so much increased, that Athelstan maintained the dominion of the sea, and obliged the Danish and Norwegian princes to court his friendship. Hume’s Hist. vol. i. p. 102, &c. Henry’s Hist. vol. iii. p. 94, &c. vol. iv. p. 225, &c.

ATHEMON, in Entomology, a species of Papilio. (Pld. cur. Linn.; Hesperia Fabr.) The wings are entire and brownish.

ATHENA, in the Ancient Philos., a platter or linitment, commended against wounds of the head and nerver, of which we find descriptions given by Oribasus, Ælius, and Æginetus.

ATHENÆ, in Ancient Geography. See Athens. Athene is also a name given to various other places: as, a town of Arabia. Phyl. — Allo, a place at the easter extremity of the Euxine sea, where was a temple of Minerva. Arrian. — Allo, a town of the Peloponnesus, in Laconia. Steph. Byz. and Suidas. — Allo, a place of Alfa Minor, in Caria. Steph. Byz. — Allo, a town of Greece, in Beotia, situate on the river Triton, overwhelmed, according to Strabo, by an inundation. — Allo a town of Acarnania; another of Liguia; another of Italy; and another of Sicily. Steph. Byz.

ATHENÆA, in Antiquity, a feast of the ancients, held in honour of Minerva, who was called Athen. These were afterwards called Panathenæa.

errisia monogynia. Gen. Char. Col. perianth one-leaved, coloured, five-parted; parts oblong, acute, erect, spreading at the top. Cor. none. Stam. filaments eight, filiform, erect; of which five are of the length of the calyx, the three alternate ones a little shorter; anthers fagittate; eight plumule bristles, shorter than the filaments, growing together with the filaments to a gland surrounding the germin. Pist. germ superior, ovate, surrouned at the base by an annular gland; style falcate, longer than the stamina; stigma deprelited, five-parted. Per. capiula globosa, one-celled, three-valved; valves from what fleshly; seeds three to five, rounded, covered with a pulp-coloured membrane, affixed to the receptacle in the bottom of the capule.

Eff. Gen. Char. Col. coloured, five-parted. Cor. none; bristles eight, feathered, between the filaments; stigma five-parted; capiula globosa, one-celled, three-valved. Seeds, three to five.

This is a branching shrub with a stem four or five inches in diameter, covered with a wrinkled grey bark; leaves alternate, oval, smooth, toothed, deciduous, four inches long; petals very short, having a small sharp flapule on each side of the base; flowers in bundles, from the axis, and upon the tubercles of the stem and branches, each on a peduncle: calyx white; there is no corolla; seeds covered with a viscid membrane, of a scarlet colour; the bark, leaves, and fruit are sharply aromatic; the leaf, by the Crokes, is called Gaffe diable. A native of Cayenne, and the neighbouring continent of Guiana, growing in a sandy soil, about half a mile or more from the thore.

ATHENÆUM, in Antiquity, a public place wherein the professors of the liberal arts held their assemblies, the rhetoricians declaimed, and the poets rehearsed their verses.

The word is derived from Athens, a learned city, where many of these assemblies were held; or from the name of Minerva, the goddess of polite arts and sciences; intimating, that Athenæum was a place consecrated to Minerva, or rather set apart for the exercises over which she presided.

The Athenae were built in form of amphitheatres; and were all encompassed with seats, which Sidorius calls cumes.

The three most celebrated Athenæa were those at Athens, at Rome, and at Lyons; the second of which, according to Aurelius Victor, was built by the emperor Adrian, for the accommodation of the professors of the liberal arts, and of those who wished to read their writings before a considerable number of people. It appears from the beginning of Juvenal’s Satires, that this manner of reading in public was very common; and that Fronte lent the use of his house and gardens to the poets, who had occasion to recite their verses before a numerous audience. This was done by others; but as it belonged to the person, who wished to read his compositions, to furnish the room, and to pay the charge of the seats, it is probable, that the emperor Adrian, for the encouragement of works of taste and science, constructed the Athenæum with a view of obviating this inconvenience. Hence the name has been applied to all kinds of buildings or colleges intended for teaching the sciences and languages.

ATHENÆUS,
ATHENAEUS, born at Attalia, in Cilicia, in the 9th year of our era, as M. Goulín conjectures, was the principal of the school of pneumaticians. Galen, who gives a particular account of the doctrines of these philosophers, says, they esteemed the qualities of cold and heat, moisture and dryness, as four elements, entering into the composition of all bodies. To these a fifth, was added, called spirit, to which Atheneus attributed the motion of the pulse. Spirit was also supposed to pervade and give life and energy to body. Galen represents Atheneus as a voluminous writer: no part, however, of his works remains, except four chapters preferred by Orphius, which throw little light on the manner in which he applied his doctrine to practice. Le Clerc, Hist. de Med.

ATHENAGORAS, in Biograph, a Christian philosopher, was a native of Athens, and flourished towards the close of the 2d century. His youth was spent among the philosophers of his time; and removing from Athens to Alexandria, he became a convert to Christianity. The manner of his conversion, according to Philip Sidetes, a writer of the fifth century held in no high estimation, was as follows: Proposing to write against the Christians and defensores of rendering his work the more complete, he read the scriptures, and was thus converted. Philip adds, that he was the first president of the catechetical school of Alexandria, and master of Clement who wrote the Stromata. Little upon which we can rely is said concerning Athenagoras by the ancients, and his character and opinions are chiefly deduced from his own works. The principal of these was his "Apology for Christians," addressed to Marcus Aurelius Antoninus, and Lactus Aurelius Commodus, whose names are prefixed to it, says Fabricius, in all the manuscripts; and probably written about the year 157 or 178. In this work he repels the calumnies of the pagans against the doctrines and manners of the Christians. He also explains the notions of the Stoics and Peripatetics, concerning God and divine things, and expouses with accurate and strong reasonings their respective errors. He discovers much partiality for the system of Plato, and supports his arguments by the authority of this philosopher, and hence he has been rankled among the Platonizing fathers. In what he advances concerning God and the Logos, or divine reason, he evidently blends the doctrines of Paganism with the doctrines of Christianity. According to Athenagoras, God is undivided, indivisible, and distinct from matter; there are middle natures between God and Matter; from the beginning, God, the eternal mind, being from eternity rational, had the Logos within himself; the Son of God is the reason of the Father in idea and energy; for since the Father and Son are one, by him and through him all things are made; the Logos was produced, that the ideas of all things might subsist, and they are contained in his spirit. On the imperfect and untractable nature of matter, on angels, demons, and other natures compounded of matter and spirit, and on other philosophical topics, Athenagoras reasons with all the fulness of the Grecian schools, so that in every page he is seen to have been by profession a philosopher; and indeed he is said to have retained the name and habit of a philosopher with a view of gaining greater credit to the Christian doctrine among the unconverted heathens. In moral philosophy, he adopted the common authorities, particularly with respect to marriage. He represents celibacy as meritorious, and second marriages as legalized adultery. In Athenagoras's "Discours of the Resurrection of the Dead," probably written after the "Apology," he argues rather from reason than scripture, in order to prove the possibility and likeness of the dead.

ATHENIUS, a greek grammanian, was born at Naukratis in Egypt, and flourished in the 3d cent. Suidas has erroneously referred him to the time of Antoninus Pius; but it appears from his own work (Deipnosophist. I. viii. p. 537. ed. Cabauf), that he wrote after the death of Commodus, and after the time of Oppian the poet. (Ib. l. ii. p. 13.) He was one of the most learned men of the age in which he lived: and, for the extent of his reading, and tenaciousness of his memory, he has not been improperly called the Varro, or Pliny, of the Greeks. The only work of this author extant is a valuable compilation from various writings, to which we have now no access, entitled Deipnosophistis, or "The Table Conversation of the Sophists." In this work the author, has introduced a great number of learned persons of all professions, and represented them as conversing together on a variety of subjects at the table of Larenius, a citizen of Rome. It contains a large collection of facts and anecdotes, forming a rich treasure of antiquities, which serve more to amuse the reader than to supply correct information. The author has intermingled with his several narrations many fatirical reflections and scandalous stories, which tend to asperse and degrade the characters of the philosophers of whole names and writings he has given an account; and, therefore, the work, copious as it is in useful instruction, must be perused with caution. It consists of fifteen books: but of the two first, part of the third, and also of the last, we have merely an abridgement. Few works have suffered more from the carelessness of transcribers, and the negligence of editors. In the 14th book, curious inquirers after the music and dancing of the ancients, and after the biography of the most celebrated performers in both arts, will find more information concerning them than in any of the treatises written expressly on these subjects; for an account of which we must refer to the work itself. The first edition was published by Aldus Manutius, in Greek, at Venice, in 1514. fol.; and at Basle, in 1535, with a bad Latin translation by Natalis Comes. Dalechamp devoted his leisure hours, for thirty years, to the translation of Athenaeus, which was published with annotations, by Cabaufon, in folio, at Leyden in 1553, 1557, 1612, and 1657. This work was also translated into French by Marolles in 1680. Cabaufon mentions an abridgement of this work by an unknown author, and at a period which he could not precisely ascertain, though he supposes it to have been made before the time of Ellulthus. Prof. Cabaufon in Athen. Suidas. Gen. Dict. Fabr. Bibl. Græc. l. iv. c. 20. § 8—S. t. iii. p. 631, &c.

ATHENIUS, a popular orator and Peripatetic philosopher, was born at Seleucia in Cilicia, had a share in the government, and was for some time a demagogue in his own country. In the time of Augustus he came to Rome, and became an intimate friend of Murena. He was charged with being concerned in his conspiracy; but the emperor not finding him guilty, set him at liberty. Upon his return to Rome after his flight on this occasion, he repeated to his friends these words of Empedocles:

"Εν χθεσιν ξενοποιεμένος και μνήμην τούτος Αθηναίο,"

"From death's dread seats and gloomy gates I come:"

The manner of his death was tragic, as he was crucified by the fall of his house. Strabo. l. xiv. t. ii. p. 987.

ATHENIUS, a mathematician, flourished about 200 years before Christ; but his country is unknown. His Greek treatise "On Machines of war," dedicated to Marcellus, who took Syracuse in the 142d Olympiad, 212 B. C., is contained in the Collection of Ancient Mathematicians, published in folio at Paris, in 1693. Fabr. Bibl. Græc. l. iii. c. 24. § 1. t. i. p. 587.
of a reformation. His writings, upon the whole, manifest an happy union of Attic elegance with philosophical penetration; so that he is reckoned a polite writer, and his Greek is Attic, though his style is rendered less agreeable by frequent parentheses. The two treatises of Athenagoras have been usually printed together, in Greek and Latin. They were published in 40. at Paris, in 1521; by H. Stephens, at Paris, in 8vo. in 1557; by Rechenberg, at Leipzig, in 1682, in 2 vols. 8vo.; by Fell, bishop of Oxford, with notes, at Oxford, in 1682, 12mo.; and with various notes by Dechaire, from the same Sheldon press, in 1706, 8vo. The Romance under the name of Athenagoras, said to be a translation from a Greek MS. brought from the east, and published in 1599, and in 1612, in French by M. Tumce, titled "True and Perfect Love," written in Greek by Athenagoras as an Athenian philosopher, containing the chaste loves of Theogonus and Charicles, of Pherecles and Melanennis, is a fiction, and was probably concocted in imitation of the Theagenes and Charicles of Herodesotus, after the overthrow of Greece by Alaric, or the destruction of the Greek empire by the Turks. Cave, H. L. t. i. p. 79. Lardner's works, vol. ii. p. 182. C. &c. Fabr. Bibl. Græc. i. v. c. i. t. v. p. 57-91. Gen. Dict. Brucker's Hist. Philos. by Enfield, vol. ii. p. 215.

ATHENÁTORIUM, among Chemifs, a thick glass cover, placed upon a cucurbit, having a slender umbo or prominent part, which enters like a flippole within the neck of the cucurbit.

ATHENIANS, in Ancient Geography. See Athens, and Attica.

ATHENIENSII PORTUS, or the port of the Athenians, was a harbour of Greece, between the Port Bucephalum and the promontory of Sperchius, on the eastern side of the promontory of Samos.

ATHENION, in Biography, a Greek historical painter, who flourished in the year 300 before Christ.

ATHENIPPUM, in Ancient Physics, a collyrium, commended against divers diseases of the eyes; thus denominated from its inventor Athenippus. Its description is given by Scribonius Largus, and by Galen after him.

Galen mentions another athenippum, of a different composition, by which it appears, this was a denomination common to several collyriums.

ATHENIS, in Biography, a famous Grecian satirist, who flourished at Chio, about 538 years before Christ. See Bupale.

ATHENODORUS, a Stoic philosopher, was a native of Cana, near Tarbus, in Cilicia, and the preceptor and friend of Augustus. During his residence at Rome, he was much respected by the emperor on account of his wisdom and probity, admitted into his confidence, and allowed to give him free and faithful counsel. Augustus, being addicted to gallantry, indulged a criminal passion for the wife of a senator, who was a friend of Athenodorus, and who communicated to him his difcontents. The philosopher availed himself of this opportunity of improving upon the mind of the emperor a sense of the danger to which he exposed himself by such practices. Accordingly, he defiled himself in woman's clothes, and, providing himself with a pagemaid, put himself into the chair in which the lady was to have been conveyed. When he appeared before Augustus in this disguise, he said to him: "See, sir, to what danger you expose yourself! An enraged husband may arm himself in this manner, and revenge with your blood the injury you offer him." The admonition is said to have produced its desired effect; the emperor received it with deference; and he became more circumspect for the future. Zosimus (l. i. c. 6.) attributes the mild plan of government adopted by Augustus to the influence of the counsels of Athenodorus. Before he left the court of Augustus, he is said by Plutarch (Apostroph. Oper. t. 2. p. 207.) to have warned the emperor against excess of pleasure, and as a preservative, to have advised him to rehearse the twenty-four letters of the alphabet, before he allowed himself to say or do any thing. Upon this, Augustus took him by the hand, saying to him, "I want your assistance still longer," and kept him for another year. Such was his interest with Augustus, that he obtained for his fellow citizens, the inhabitants of Tarbus, relief from some of the taxes which oppressed them; and on this account he was honoured by them with an annual festival. At an advanced age the emperor permitted him to return to his native country; and finding it disturbed by factions, which had been excited by Boethus, when Antony had inviolate with power, he exerted himself with prudence and firmness, in order to restrain and suppress them. By recruiting the exhausted funds of Tarbus, correcting the abuses which threatened its ruin, and introducing a new code of municipal law, he contributed to the revival and permanence of its prosperity. Having served his country faithfully during a protracted life, he closed it with honour, and with the regret of his fellow-citizens, at the advanced age of eighty-two years. He was a considerable writer; and several of his works are cited by the ancients. Strabo says, (l. i. p. 6.), that he wrote concerning the ocean and its tides; and Stephanus (art. AGRIPPA) informs us, that he wrote the history of his own country; but none of his works are now extant. This Athenodorus is not the same man who is mentioned by Suetonius (in Claud. c. 4. and 5.) having been entrapped by Augustus with the charge of education of Claudius Nero, afterwards emperor. Fabricius, however, asserts that they were the same person. Gen. Dict. Strabo, l. 14. t. ii. p. 991. Brucker's Hist. Philos. by Enf. vol. ii. p. 117. Fabr. Bibl. Græc. l. iii. c. 15. t. ii. p. 591.

ATHENODORUS Cordylus, a Stoic philosopher of Tarbus, was probably a native of Perga, and lived about 60 years before Christ, and was the intimate friend and companion of Cato of Utica. He was keeper of the public library at Perga, and having refused several solicitations to leave this retreat, he was at last prevailed upon by Cato, who visited Asia for this purpose, to join him in the war which he had undertaken for the restoration of Roman liberty. Cato is said to have valued himself upon the success of his application to Athenodorus, more than if he had shared the conquests of Lucullus or Pompey. Strabo says, that he lived and died with Cato. Fabricius fuggetis, that this Athenodorus was the author of a work against the categories of Aristotle, mentioned by Porphyry, Simplicius, and Stobaeus. Plut. in Vit. Caton. Oper. t. i. p. 667. Diog. Laert. Strabo, l. xiv. t. i. p. 991. Fabr. Bibl. Græc. l. iii. c. 15. t. ii. p. 371.

ATHENODORUS, a famous ancient sculptor, who was born at Rhodes. According to Pliny, he was a scholar of Polyctetus, who flourished about the eighty-seventh Olympiad, or 432 years before Christ. He was one of the three who jointly executed the famous group of Laocoon; the other two were Agelander and Polidore.

ATHENOPOLIS, in Ancient Geography, a town of Gallia Narbonensis, on the coast of the Valunians, between port Citharita and Forum Julii, according to Pliny. Its precie is not now known.

ATHEHENRY, in Geography, a borough town of the county of Galway, in Ireland, which gives name to a barony. Within an extensive circuit of dilapidated walls, and their ruined towers, the remains of castles and abbeys, that are intermixed with the cottages of a now small village, present a monument of its former consequence. There are also many
many ruins of castles and churches in its neighbourhood. At this town was fought a battle between Pheidias O'Connor, prince of Connought, an associate of Edward Bruce, and an English army under William de Burgo and Richard de Bermingham, in which, after a desperate engagement, the Irish were defeated with the loss of their prince and eight thousand men. This event happened in the year 1316. Distance from Dublin nearly 92 miles. N. lat. 57° 54' W. long. 8° 30' 30". Beaumont. Leicand.

ATHENS, in Ancient Geography and History, a celebrated city, called by way of eminence Mmnyna, or, as the

contemplated, the site was the capital of Attica, and the seat of the Grecian empire. It was founded by Cecrops, about 1535 years before Christ, and from him called "Cecropia." It afterwards, as some fay, in the reign of Eriphantus, about 1487 years B.C., or according to others, in the reign of Erechtheus, about 1397 years B.C. afforded the name of Athens, from Minerva, denominated by the Greeks Aphiay, and considered as the protector of the city. Cecropia was seated upon a hill or rock in the midst of a spacious and fertile plain, partly with a view of securing it against piratical invaders, and partly to prevent its being overwhelmed by inundations, which were much dreaded in those ancient times. In process of time, as the number of inhabitants increased, the whole plain was covered with buildings, which were denominated from their situation, "the lower city," and Cecropiawas called "Acropolis," or "the upper city." See Acropolis. The old city, or citadel, was sixty six, or about 23 leagues in circuit; it was fenced with wooden pales, and as some fay, let about with olive-trees; and it was also fortified with a strong wall, partly built by Cimon, the son of Miltiades, out of the spoils of the Persian wars, and situate on the south side of the citadel; and partly on the north side, by Agoras and Hyperibiou, who, according to Pausanias (in Attic. l.c. c. 28. p. 75.), migrated from Sicily to Acaarnania and denominated from them, who were called Pelfagi, the Pelfagie wall. The only entrance into the citadel was by one gate on the south-west, constructed at a great expense by Pericles, and denominated Propylaeum. See Propylaeum. The inside of the citadel was adorned with innumerable edifices, statues, and monuments, all of which it would be too tedious to recount. The most remarkable are the following.—At the entrance was a temple dedicated to Victory, adorned with paintings which were principally the work of Polygnotus, and constructed of white marble. Within the citadel were an immense number of statues erected by religion or gratitude, on which the chief gods of Myron, Phidias, Alcamenes, and other artificers of renown, seem to have bestowed animation. Of these statues some were the work of famous Athenian generals, such as Pericles, Pharnaces, and Timothecus; and others, the gods. About the middle of the citadel were the magnificent temple of Minerva, denominated Heptameron, and Parthenon (see Parthenon); and the temple of Minerva Polias and Neptune Erechtheus, one part of which was consecrated to the former, and the other to the latter. On one side was exhibited the olive-tree which sprang out of the earth at the command of the gods, and which so greatly multiplied in Attica; and on the other, the well, whence they pretend that Neptune caused the water of the sea to gush out. Thus these divinities are said to have contended for the honour of conferring their names on the rising city; but the gods decided in favour of Minerva, and the Athenians for ages preferred agriculture to commerce. Here, however, they have erected one common altar, which is called the altar of oblivion. Before the statue of the goddess was suspended a golden lamp, the work of Callimas-
square or forum. In the royal portico, where the second of the archons held his tribunal, and where the aropolos sometimes assembled, were several statues, such as those of Phidias, Conon, Timotheus, and Evagoras king of Cyprus. Near the royal portico was that of Jupiter Liberato, where Enharmon the painter had represented in a series of pictures the twelve gods. Theseus, the people of Athens, and an engagement of the cavalry, in which Gryllus, the son of Xenophanes, attacked the Thebans commanded by Epaminondas. The Apollo of the adjoining temple was the work of the same master. From the royal portico two streets branch out, and terminate in the forum: that on the right was decorated by a number of Hermas, or heads of Mercury supported by peddrels, erected for recording some glorious achievements, or for inciting to some acts of wisdom. This street is terminated by two porticoes that front the forum; the one, that of the Hermes; the other, and the most handsome, is called the Porche, at the gate of which was the statue of Solon. The walls within the Porche were covered with bucklers taken from the Lacedaemonians and other nations, and enriched with the works of Polygnotus, Micon, Panoeus, and other celebrated painters. The forum, which was extremely spacious, was decorated with buildings defined to the worship of the gods, or the service of the state, or as places of asylum to the wretched; and statues of kings or individuals who had merited well of the republic. An adjoining square contained a temple in honour of the mother of the gods, with a statue of her by Phidias; and the place in which the senate assembled. In the temple of Mars, at a small distance, was a statue of that god, executed by Alcamenes, a pupil of Phidias.

In the middle of the city, between the forum and the citadel, was the temple of Theseus, built by Cimon some years after the battle of Salamis; it was smaller than that of Minerva, but built after the same model; like that, it was of the Doric order, and an elegant structure. It was enriched by the labours of skilful painters; and the remains of it are to be seen at this day. It was allowed the privilege of being a sanctuary for slaves, and for all persons of mean condition who fled from the persecution of men in power; in honour of Theseus who, whilst he lived, was the protector of the diffused. Near to the temple of Theseus, Paunianas places the temple of the Dioscuri, or of Callorand Pollux; and above this temple was the grove of Aglauros, situate under the Acropolis. Near to this grove, north of the Acropolis, was the Prytaneeum, where citizens who had rendered signal services to the state, were maintained at the public expense. See Prytaneeum. Beyond this building, on the north-east side of the citadel, was the street of the Triopods, or the street of triumphs, in which were temples and hoplites containing tripods of brads, which were dedicated by those who had been victorious in the contests that filled the past among the poets, musicians, and dancers. In one of these edifices was the famous satyr, called by the Greeks Πριξιάτης, elated by Praxiteles himself, one of the chief of his productions, and ranked by the public among the masterpieces of art. The street of the Triopods led to the theatre of Bacchus, where the people sometimes assembled to deliberate on affairs of state, or to be present at the representation of tragedies or comedies; and opposite to this theatre was the temple of Bacchus, one of the most ancient temples of Athens; it was situated in the quarter of Limne, or Mardon, and was opened only once a year. Between the street of the Triopods and the theatre of Bacchus was the Odeum, built by Ptolemy for musical competitions. (See Odeum.) In the quarter of the mearias, fourth of the citadel, was the temple of the Olympian Jupiter, begun by Pheidias, continued by several succeeding governors; and finished in the time of Adrian. The ruin of this temple consists of very large and beautiful columns of the Corinthian order, placed about six feet in diameter and sixty in height. The temple of the Pythian Apollo lay to the north-west of that of Jupiter Olympus, and nearer to the citadel; and near to the Propylaeum, at the bottom of the citadel, on the north side, is the temple of Apollo and Pan, in a grotto or cave, where Apollo is said to have delivered Creusa, daughter of king Eriechtheus. Besides these there were several other temples, such as the temple of Diana, that of the Eight Winds, and the Pantheon dedicated to all the gods. (See Pantheon.)

Without the city, between the wall and the river Ilissus, was the demos of Ilidium (see Stadium, and Cynosarges). Beyond the Ilissus, and to the north of the Stadium, was mount Hymettus, and the district called Agre, in which were the temples of Ceres, and of Diana Agroteres, or the huntress. Above this were the Gymnasia of the Lyceum (see Lyceum), and of the Cynosarges. To the north-west, in the Ceramics that lay without the city, and distant from it about six stadia, was the Academy. (See Academy.) Beyond the Academy was a hill called Colonus, on which Sophocles laid the foundation of his Ædipus Colonus. The river Cepheus enriched this district with its waters, though in summer this stream, and also the Ilissus, were occasionally dry.

The topography of ancient Athens, given by Pausanias, so far corresponds to those remains, whose names and situations have been described by modern travellers, as to afford a strong presumption of its accuracy; and it affords a kind of standard by which the correctness of other descriptions may be estimated. In order to form a just notion of his plan, it is necessary to consider the stations from which his routes commenced; and these will appear to be in a natural order, and to have embraced in the most comprehensive manner the whole of the city of Athens. His two principal stations were the Ceramicus and the Prytaneeum; and his routes from the former station noticed those parts that lay to the north-west, and those from the latter such as were situated to the north-east, and south of the Acropolis. Having arrived at Athens from the Piraeus, and passing through the outer Ceramicus and the city gate, he entered the inner Ceramicus, which was his first station. On the right hand, he says, is seen the royal porch, and he there enumerates among other objects, the temple of the mother of the gods; the temple of Ceres; and Proserpine; and another. Pausanias having detailed the first route, without describing any objects in returning, commences his second, which appears to be very short; remarking only the temples of Vulcan, and of Venus Urania, above the Ceramicus, and which may be supposed to have been northward of the gate Dipylon. He then proceeds to say, that the traveller, directing his course to the Poecile or Poikile, will observe the several objects in the following order: besides others, the Market place, the Gymnasion, the temple of Theseus, the temple of the Dioscuri, and the grove of Aglauros: the temple of Theseus still remains. According to the order of Pausanias, we must look for the Poikile, the Market place or forum, and the Gymnasion, between the gate Dipylon and the temple. According to Pausanias, the temple of the Dioscuri was near to that of Theseus; and above the temple of the Dioscuri was the grove of Aglauros; and as this grove was under the Acropolis, it must have been between that place and the temple of Theseus, or nearly between the Acropolis
Acropolis and the hill of the Areopagus. Near to the grave of Aglabitus was the Prytanæum, north of the Acropolis, and this was the second flat of Pentanias. The full route from this flat is explained as defending from the Prytanæum to the lower parts of Athens; and it includes the temple of Serapis, of the goddess Lucina, of the Olympic Jupiter, and the Delphian Apollo, the Gardens, the Lyceum, the river Euphræs, the temple of Diana le Hundrels, and the Stadium. Without describing any objects in his return from the Stadium to the Prytanæum, Paeonias commences his second route from that flat by the way called Tripodes, in which, he says, there are temples, tripods, and other works deserving notice; and, in the following order he mentions the temple of Dionysius, the temple of Bacchus, the imitation of the tent of Xerxes, the theatre of Bæclesus, the well called Southern, the tomb of Calus, the temples of Hecatæus, of Themis, of Earth, and of Virid Ceres; and then enters the Propylæa of the Acropolis. Within the Acropolis, he describes, among other objects, the Parthenon, the temples of Erechs, Polias, and Pandrosus: and his descriptions agree so exactly with the remains found there, that this part of his topography affords an evidence of his precision in other respects. He then passes from the Acropolis over the Areopagus, thence to the tombs, and to the Academy; and this route is in the order of their situation; for he had before passed under the north-call side of the Areopagus, in his route from the temple of Theseus to the Prytanæum. The tombs, which are in the neighbourhood of the Museum, according to Dr. Chandler, were evidently in the situation to which Paeonias alludes; and the academy is known to have been to the west of the walls of the city. It has been the uniform opinion of antiquaries, that the old city of Athens was built on the northern side of the Acropolis; and the intendment of Adrian’s arch is a confirmation that the addition to the city, built by that emperor, and called after him Adrianople, was on the southern side. Mr. Stewart, however, in his “Antiquities of Athens,” (vol.iii.) conjectures, that the ancient city was on the south side of the Acropolis; but it has been alleged, that there are no remains which countenance this supposition; and besides, it should be recollected, that the Pæagi, who fortified the Acropolis, were permitted to dwell beneath the walls; they were afterwards acceded by the Athenians of way-laying their daughters, as they went from the city to fetch water from the Euphræs: this could not possibly have happened, without supposing that the ancient city was on the north side of the Acropolis, and that the part inhabited by the Pæagi was on the south side: for no other part would correspond to the account of the Pæagi being in a situation between the city and the river. The Pæagi were afterwards driven out of Attica; the spot on which they dwelt was excrætred; and the Delphic oracle advised, that it should be kept rough and uncultivated. It is, however, well known, that this spot, in after-times, was inhabited; but it is somewhat singular, that, except the theatre and one or two monuments, immediately under the walls of the Acropolis, the whole of the plain between the Acropolis and the Euphræs, contains no remains of ancient works, besides one solitary column. This furnishes a strong argument against the supposition of the ancient city being erected in this situation; for undoubtedly the chief monuments of their grandeur would be contained within the city. This circumstance also accounts for Pentanias passing by, without determining anything as situated there: it was sterile in antiquities, and therefore furnished no object directing his notice. For these observations, we are indebted to an anonymous writer.

See Monthly Review enlarged, vol. xvii. p. 35. For the plans of Athens, annexed to the travels of Anacharsis, see the Maps of this work.

ATHENS, and the Athenians, History of. It has been already observed, that the city of Athens was founded by Cecrops about 1550 years B.C. This prince reigned fifty years. Under the reigns of his successors, various circumstances combined to determine the character and situation of the nation. The succession of princes appears, with few exceptions, the succession of improvement. Under the reign of Eriæthis, the colony of Cecrops ascended horses, already domesticated to the bit, to draw wheel carriages; and prohibited by the labour of beech, which useful race of indians they carefully preserved on mount Hymettus. Under Pandion, they made new progress in agriculture; but a long drought having destroyed the hopes of the husbandman, the harvests of Egypt supplied the wants of the colony, which thence contracted a taste for commerce. Eriæthis, his successor, rendered his reign illustrious by useful infusions, and the Athenians dedicated a temple to him after his death. A considerable portion of barbarism still remained; the country, very imperfectly cultivated, maintained great numbers of savage animals, and still more savage men. The Grecian woods and mountains abounded in lions, bears, and other fierce animals, that often roamed from their haunts, and spread terror and desolation among the adjoining valleys. The valles themselves teemed with men of brutal strength and courage, who availed themselves of the weakness of government, to perpetrate horrid deeds of violence and cruelty. About the year 1750 B.C. the first worthies of Greece, animated rather with the daring and useful, than with the romantic spirit of chivalry (Plutarch’s Theseus), set themselves with one accord to remedy evils which threatened the existence of society. These travelled over Greece, and freed it from the violence both of kings and individuals: they appeared to the Greeks as beings of a superior order; and that infant people, no less extravagant in their gratitude than fears, rewarded the exploit with so much glory, that the honour of protecting them became the first ambition of noble minds. Of these, one of the most eminent was Theseus, the son of Egeus king of Athens, who was ardently desirous of rivaling the exploits of Hercules. The Pellanides, a powerful family of Athens, having attempted to wrench the sceptre from the aged hands of Egeus, young Theseus, now approaching to man’s estate, overwhelmed the projects of the conspirators. (Plutarch’s Theseus.) Marathon, the second city in Attica, had its environs infested by a furious bull; the heroic prince subdued this terrible animal (Plutarch’s Theseus); and the Athenians regarded his success with astonishment and admiration. But his countrymen had soon after a call for their wonder and gratitude in a much more signal achievement, and more momentous benefit. Minos, king of Crete, accused them of having put to death his son Androgæus, and compelled them by force to deliver him, at stated intervals, a certain number of youths and maidens. These were to be chosen by lot, and their destiny was death or slavery, (Plutarch’s Theseus.) It was now the third time that the pledges of their affections were to be torn from their unhappy parents. All Athens was in tears, but Theseus revived her hopes. He undertook to free the city from this odious tribute; and, to accomplish the noble project, voluntarily enrolled himself in the number of the victims, and embarked, for Crete. The adventurism of Theseus in Crete, exhibited by the inventive and often fanciful poetry of the Greeks, contains a great portion of the marvellous, through which a skillful and delineating reader may
may discover the probable. According to the tale which
the Athenians relate, it was the cruel practice of Minos to
shut up his tributary victims, the moment he received them,
in a labyrinth, where they were soon after devoured by the
minotaur, a monster half a man and half a bull, the offspring
of the infamous amour of Pasiphae, queen of Crete; they
add, that Theseus, having slain the minotaur, brought back
the young Athenians, and was accompanied on his return
by Ariadne, daughter of Minos, who led him in escaping
from the Labyrinth, and whom he abandoned on the shores
of Naxos. The Cretans, on the contrary, allege, that
the Athenian hostages were deterred to the victims in the
celebrated games in honour of Theseus; that Theseus,
having obtained permission to enter the lists, overcame 'Tau-
rus, general of the troops of Minos; and that this prince had
the generosity to do justice to his valor, and pardon the
Athenians.

Minos had established an excellent system of government,
which equally secured the authority of the prince and the
liberty of the people, and connected religious with political
influences. (Aristotle's Politics.) The advantages of this
system Theseus discerned, and having returned and ascended
the throne of Attica, vacant by the decease of his father,
he resolved to improve the government of his country.
The twelve towns, founded by Cecropes, were become fo
many republics, each of which had its particular magistrates
and chiefs almost independent, whose interests, clashing con-
tinually, produced frequent wars; and though imminent
dangers sometimes obliged them to have recourse to the
protection of the sovereign, the succeeding calm soon awak-
ened their ancient jealousies. The royal authority, flogg-
ing between despotic and degradation, alternately
inspired terror and contempt; and the people, by the vice
of a constitution, the nature of which was not exactly un-
derstood either by prince or subjects, had no means what-
ever to defend themselves against the extremity of slavery,
or the excess of licentiousness. Theseus formed his plan;
and, superior even to minute obstacles, took upon himself
his execution in detail. He traversed the different districts
of Attica, and endeavoured everywhere to inculcate him-
self into the favor of the people, who with ardour received
a project which seemed to restore to them their primitive
liberty; but the wealthier classes, fearing to lose the authority
they had usurped, and apprehensive of feeling a kind of
equality established between all ranks of citizens, murmured
at an innovation which diminished the royal prerogative;
not daring, however, openly to oppose the will of a prince,
who was endeavouring to obtain by persuasion, what he
might exact by force, they consented, but with a secret
determination to retort against the measure when circum-
stances might be more favourable. It was now determined
that Athens should be the metropolis and centre of the state;
that the female of the cities should be abolished; that the
legislative power should reside in the general assembly of the
nation, divided into three classes, the nobles, the husband-
men, and the artisans; that the first magistrates, chosen
out of the former, should have the superintendence of the
sacred rites, and be the interpreters of the laws; that the
different orders of citizens should form a mutual balance, the
first, having in its favour the splendor of dignities; the se-
cond, the importance of services; and the third, the super-
iority of number. (Plutarch's Theseus.) It was deter-
mained in fine, that Theseus, placed at the head of the re-
public, should be the defender of the laws it might enact,
and the general of the troops defined to its defense. He
erected tribunals for the magistrates; enlarged the capital,
and embellished it as far as the imperfection of the arts
at that time would permit. Strangers, invited to become
citizens, flocked thither from all parts, and were incorpo-
rated with the ancient inhabitants. He added the territory
of Megara to the country; he placed a column on the illu-
mus of Ceres, as a boundary between Attica and Pelop-
nousus; and revised, near this pillar, the Ilithian games,
in imitation of those lately instituted by Hercules at Olym-
pia. Every thing now seemed favourable to his views: he
governed a free people, retained in obedience, by his mod-
eration and his bounties; he dictated laws of peace and hu-
manity to the neighbouring nations, and enjoyed a foretaste
of that profound generation with which succeeding ages gra-
dually honour the memory of great men. Theseus also en-
gaged in new undertakings of value, some of them very
unjustifiable (see Theseus, Hercules, and Pithophone),
and all of them prejudicial to his country, by occupying that
time which might have been employed in the further improve-
ment of the state. But with these exceptions, Theseus was
a very great and beneficial sovereign, and his reign was a very
important epoch in Athenian history. For several ages,
however, Athens was only a secondary power; in the time
of Homer, that state felt but fifty ships, whereas several
other countries sent eighty, and Mycene a hundred. The
complement of men to each, being 120, the troops amounted
to about 6000.

Full fifty more from Athens flen the main,
Led by Menelthus thru' the liquid plain;
No chief like thee, Menelthus! Greece could yield,
To martial armies in the dusty field.
The extended wings of battle to display,
Or close the embolden host in firm array.
Nellor alone, impro'd by length of days,
For martial conduct bore an equal praise.
to death; a sacrifice which so animated his troops, that they entirely defeated their enemies. Codrus was the last king of Athens, and on his death, the government became republican, by the establishment of Archons, B.C. 1570: an office which was at first hereditary, and little inferior, in point of power, to royalty itself. Melo, the son of Codrus, first held the office of Archon. His brother Niceratus and Andocides, probably dissatisfied with these transactions, determined to leave their country. This design was approved by the Achæans and Mæssian refugees, and by many Athenian citizens, who complained that Attica was too narrow and barren to maintain the increasing numbers of its inhabitants. The rebellious spirits in Phocis, Beotia, and other neighbouring provinces, eagerly joined the emigrants. They failed to Attic Minor, B.C. 1555, expelled the ancient inhabitants, a mixed race of Lydians, Carians, and Pelasgi, and feized the central and most beautiful portion of the Aetolic coast. (Herodotus, Ch. 9.) Their colonies were gradually diffused from the banks of the Hermus, to the promontory of Poseidon. They afterwards took possession of Chios and Samos: and all these countries were united by the common name of Ionia, to denote that the Ionians composed the most numerous division of the colony.

See Ionians.

The government of the Archons, after several changes, at length became annual, and their number was nine. Peloponnesus being now involved in the long and bloody wars between the Mæssians and the Spartans, the Spartans, being in great danger, applied for assistance to the Athenians, who sent them aid on one occasion, and were instrumental to the reduction of the Mæssians, and the aggrandizement of the Spartans, defined to become formidable rivals to themselves. During the first ages of Archontic government, Athens was little occupied by foreign wars, but very greatly by difficulties and seditions. They had no written laws, and were perpetually disagreeing on points of religion and government. The inhabitants of Attica were separated into three factions, each of which had at its head one of the most ancient families of Athens. Divided as they all were by interest, diversity of character, and situation, it was impossible for them to agree in the choice of a form of government. The poorest and most independent, confined to the adjacent mountains, favoured a democracy; the wealthiest, diffused over the plain, wished for an oligarchy; while the inhabitants of the coasts, engaged in maritime and commercial affairs, were for a mixed government, which might secure their possessions, without proving injurious to public liberty. To this source of divisions, each party united the inexact hatred of the poor against the rich. Obfure citizens, overwhelmed with debts, had no resource but that of selling their liberty, or that of their children, to mercenary creditors; and the greatest part of them had determined to abandon a country which held out only ineffectual labour to fome of them; and eternal slavery, and the facrifice of every sentiment of nature, to the remainder. From the growth of knowledge, new sources of industry, new necessities and vices, were diffused through society. Licentiousness was either passed over with impunity, or reprehended by arbitrary punishments. The life and fortune of individuals were left at the discretion of magnates, who, subjected to no certain limitations, were but too much disposed to listen to their prepossessions or their interests. In this confusion, which menaced the state with immediate destruction, Draco was chosen, B.C. 624, with full powers to exercise the whole of legislation, in its most extensive or circumstantial views. The particulars of his private life are little known to us, but he has left the reputation of a man of worth, polished of real knowledge, and fiercely attached to his country. Other strokes of character might perhaps establish his reputation, but are not necessary to his memory. Like all persons sagacious and sagacious, he formed a code of laws and morals; he took the citizens at the moment of his birth, prescribed the manner of his marriage, education, and death, regulated the conduct of life, and, correcting these partial views with the main objects, flattered himself he should be able to form free men, and virtuous citizens; but he only produced malcontents, and his regulations excited so many murmurs, that he was compelled to take refuge in the island Ægina, where he soon after died.

His laws were strongly impressed with the peculiarities of his character; they were as severe as his manners had ever been rigid. Death was the embellishment he inflicted on infidels, and the only punishment he decreed for the slightest offences, as well as for the most atrocious crimes; he was accustomed to say, that he knew of none milder for the former, and could devise no other for the latter. It seems as if his powerful mind, virtuous even to excess, was incapable of any indulgence for crimes at which it revolted, or for those weaknesses over which it triumphed without an effort. As he had not attempted any change in the form of government, the interline divisions augmented from day to day. One of the principal citizens, named Cylon, formed the project of fixing on the sovereign authority; he was besieged in the citadel, where he had long defended himself, and at length, wanting provisions, and defeated by the hope of famine, eluded, by flight, the punishment due to his crime. His followers took refuge in the temple of Minerva; from which asylum they were ejected by the promise of life, and instantly massacred. Some of the unfortunate men were murdered even on the altars of the awful Eumenides. The indignation excited by this action was universal; the people at once executed the perjury, and flattered at the impiety of the victors; and the whole city expected that some dreadful calamity would be immediately inflicted by celestial vengeance. Amidst this general confirmation, news was brought that the city of Nisa and the isle of Samos had fallen by the arms of the Megarensians. To this melancholy intelligence succeeded, soon after, an epidemic distemper. The public imagination, already agitated, was suddenly fired with panic terrors, and haunted by a thousand terrifyingchimeras. The augurs and oracles being consulted, declared that the city, polluted by the profanation of the holy places, must be purified by the ceremonies of expiation. The Athenians, therefore, sent to Crete for Epimenides. B.C. 612, considered as a man who had an intercourse with the gods (Pausanias, H. I.), and who saw into futurity. He really appears to have been a reformer endowed with talents and knowledge to engage confidence in his opinions, and authority of manners to command respect. The first years of his youth he passed in solitary places, and formed wholly absorbed in the study of nature, forming his imagination to enthusiasm, by fasting, silence, and meditation, without any other ambition than by making himself acquainted with the will of the gods, to secure his dominion over the minds of men. His successes surpassed his hopes, and he acquired such a reputation for wisdom and facility, that in times of public calamity, nations interested in him the favour of purifying them by rites, which, as they allowed, he could render more acceptable to the divinity. Athens received him with transports of hope and fear. He directed that new temples and new altars should be built to immolate the victims he had chosen, and that these facilities
ATHENS.

should be accompanied by certain hymns. As while speak-
ing he seemed agitated with a divine inspiration, his impe-
tuous eloquence was irresistible. He availed himself of the
ascendency he had acquired, to eff.ct several changes in the
religious ceremonies, and in the manners of the people; and
by various useful regulations, he endeavoured to bring the
Athenians to the two principles of social union and justice.
But the reform of Ephimenides, though beneficial as far as it
extended, was very inadequate to the evil. The people
were still suffering under combined anarchy and oppression;
the magistrates plundered the treasury and the temples; and
often betrayed for bribes the interests of their country;
the rich tyrannized over the poor, the poor continually
alarmed the safety of the rich; the incapacity of creditors
knew no bounds; they compelled the insolvent debtors to
cultivate their lands like cattle, to perform the service of beasts
of burden (Gillies, v. ii. 107.), and to transfer, to them
their sons and daughters, whom they exported as slaves
to foreign countries. In such a disturbed situation, there
arose for their relief the illustrious Solon, B.C. 594. This
celebrated sage first distinguished himself by military policy
and warlike efforts. The Athenians had been long engaged
in a war against the Megarensians, concerning the island
of Salamis; fatigued and broken by terrors and arduous bata-
lilies, they abandoned the enterprise in despair, and even
made a law enacting the punishment of death against any
one who should propose the capture of that island. Solon,
aware of the importance of a posture that commanded the
coasts of Attica, and depriving the national independence
in glorious as well as impolitic, ardently desired torouse his
countrymen to more vigorous counsels; but the new penal
law restrained his efforts. At length he devised an expedi-
tent for patriotically transgressing the pufillaunimous law,
and avoiding the punishment. He accordingly counterfeited
infancy, and caused his family to report that he was
actually mad (Plutarch's Solon); the rumour being spread
and generally believed, he composed a poem, describing the
advantages of Salamis, and inciting the Athenians to renew
the war. His verses, strong and impressive, produced the
defired effect. The people were roused, an expedition was
undertaken, and Solon is, by Plutarch, said to have devised
the following stratagem for cutting off the Megarensians,
who then occupied Salamis. With his friend Philocrates he
failed at the head of an armament to Ceros; there finding a
number of women sacrificing to Ceres, he sent a confidential
perfon to Salamis, instructed to profess himself a defeter,
and to tell the Megarensians, that if they did not desire to
have the chief Athenian women, to make all fail to Ceros. The Mega-
reensians, taking the foary for truth, presently manned a ship;
and Solon deferving this ship just as it put off from the
isle, commanded the women to be gone, and ordered
some bezeeclis youths, dreen in these woman's clothes, their
shoes and mitres, and privately armed with daggers, to dance
and wander near the shore, till the enemies had landed, and
the ship was in their power. Things being thus ordered,
the Megarensians were allured with the appearance and
coming near the shore, fwo who should leap out first, bit
were only to ferve the women; but were to warmly received,
that not one of them escaped. The Athenians failed for
the isle, thus deprived of its defenders, and annexed
Salamis to the territories of Athens. The fame which
Solon thus acquired, he soon increased by his prudence and
conduct with regard to another subject of foreign policy.
The Criffians were a flourishing state, not far from Del-
phi, and, commanding the approaches to that rendezvous
of Grecian superflition, derived considerable encomium
from the expences of the devotees. But with the advan-
tages they were not satisfied; they began to exact vexations;
and exorbitant duties from the merchants who came to ex-
pose their wares in the sacred city; which, on account of the
great concourse of prodigal pilgrims from every quarter,
foon became the seat, not of devotion only, but of dilipa-
tion, vanity, and licentious pleasure. It was in vain for the
merchants to complain against these unexampled impositions;
the taxes were continually increased; the evil admitted not
the expectation of either remedy or relief; and the ftrangers,
accustomed to it by custom, began to submit without mur-
rur; and perhaps endured the hardship with greater pa-
tience, when they perceived that they drew back the tax in
the increased price of their commodities. Encouraged by
this acquiescence in their tyranny, the Criffians levied a
severe impost on the pilgrims, whether Criffes or Barbarians,
whom it visited the temple of Apollo; a measure directly incon-
sistent with the degree of the Amphictyons, which declared
that all men should have free access to the oracle, as well as
extremely hurtful to the interest of the Delphians, who soon
felt a gradual diminution of their profits from the holy
shrine. The Criffians, totally regardless of the sentiments of
religion, plundered the temple of Delphi, with many cir-
cumstances of aggravating atrocity. Solon roused his coun-
trymen to avenge the sacrilege; and to his ingenuity and skill
it was chiefly owing that the Criffians were vanquished (Gill-
ies, vols. i. 221.); but Solon was defcribed to render himself,
by legislation, most beneficial to his country. The general
opinion of his genius and virtues, joined to the experience
of his military talents, success in wars, and political address,
had procured him distinguished influence over the people.
His experienced ability, and above all, his approved wisdom
and equity, pointed him out for the noblest and most sublime
employment of humanity, that of regulatiing the laws and
government of a free people. Such, at least, the Athenians
may be concluded, when their unanimous suffrage rendered
Solon the absolute umpire of their whole constitution and
policy. When he undertook the reform of the state,
tyranny and disorder prevailed; the wretched populace,
deriving courage from despair, had determined no longer
to submit to such multiplied rigours; and, before the wild-
ness of the lawgiver interposed, they had taken the revolu-
tion to elect and follow forms of like leading, to attack and butcher
their oppressors, establish an equal partition of lands, and
institute a new form of government. But the numerous cli-
ents and retainers, who, in a country little acquainted with arts
and manufactures, depended on the wealthy proprietors
of the lands and mines of Attica, rendered this undertaking
allike dangerous to both parties; so that both became willing
rather to submit their differences to law, than to decide
them by the sword. The impartiality of Solon merited
the unlimited confidence of his country. He maintained
the ancient division of property, but abolished debts: he es-
tablished the rate of interest at 12 per cent, at which it after-
wards remained; but forbade that the insolvent debtor should
become the slave of his creditor, or be compelled to sell his
children into servitude. After these preliminary regulations,
which seemed immediately necessary to the public peace,
Solon proceeded, with an impartial and steady hand, to new
model the government; on this generous but equitable prin-
ciple, that a few ought not, as hitherto, command, and the
many obey; but that the collective body of the people,
legally convened into a national assembly, were entitled to
decide, by a plurality of voices, the alternatives of peace and
war; contract or dissolve alliances with foreign states; enjoy
all the branches of legislative or sovereign power; and elect,
approve, and judge the magistrates or ministers entrusted
for a limited time, with the executive authority. Strangers,
and
and all those who could not ascertain their Athenian descent, both in the male and female line, were totally excluded from the assembly and courts of justice. The regulations of Solon provided that the race of pure Athenians should be preserved, and that his blood should be kept pure from admixture and corruption; nor could any foreigner, whatever merit he might claim with the public, be admitted to the rank of a citizen, unless he abandoned for ever his native country, professed the knowledge of some highly useful or ingenious art, and, in both cases, had been chosen by ballot, in a full assembly of six thousand Athenians. The numbers of this convention, and still more their impetuosity and ignorance, must have proved inconsistent with good government; if Solon had not feared the violent passions of the republic from the waves of popular frenzy, by the two firm anchors of the senate and the areopagus; tribunals originally of great dignity, and of very extensive power, into which men of a certain description only could be received as members. Solon divided the Athenians into four classes, according to the produce of their estates. The first consisted of those whose lands annually yielded five hundred measures of liquid, as well as dry commodities, and the minimum of whose yearly income may be calculated at sixty pounds sterling, which is equivalent, if we elimate the relative value of money by the price of labour, and of the things most necessary to life, to about six hundred pounds sterling in the present age. The second class consisted of those whose estates produced three hundred; the third two hundred; the fourth, and by far the most numerous class of Athenians, either possessed no landed property, or at least enjoyed not a revenue in land equal to twenty-four pounds sterling, or, agreeably to the above proportion, two hundred and forty pounds of our present currency. All ranks of citizens were alike admitted to vote in the public assembly, and to judge in the courts of justice, whether civil or criminal, which were properly so many committees of the assembly. But the three first classes were exclusively entitled to fit in the senate, to decide in the areopagus, or to hold any office of magistracy. To these dignities they were elected by the free suffrages of the people, to whom they were accountable for their administration, and by whom they might be punished for malversation or negligence, although they derived no emolument from the diligent discharge of their duty. The senate of four hundred, which, eighty-six years after its institution, was augmented to five hundred by Chisthenes, enjoyed the important prerogatives of convoking the popular assembly; previously examining all matters before they came to be decided by the people, which gave them a negative before debate in all public resolutions; and of making laws, which had force during a year, without requiring the consent of the populace. Besides this general imponderance of authority, the senate was exclusively invested with many particular branches of the executive power. The president of that council had the custody of the public archives and treasury; the senate alone built ships, equipped fleets and armies, feized and confined state criminals, examined and punished several offences, which were not expressively forbidden by any positive law. The weight of such a council, which assembled every day, except festivals, in a large mixture of antiquity into the Athenian constitution; this, as we shall immediately explain, was still further increased by the authority of the Areeopagus.

The principal magistrates in Athens were the nine archons. (See Archon.) These nine archons, or presidents of the tribe, almost of the juries, like all other Athenian magistrates, were, at the expiration of their canonic office, accountable to the people; and when their conduct, after a severe scrutiny, appeared to merit public approbation and gratitude, they were received, and remained for life, members of the areopagus, a senate invested with a general inspection over the laws and religion, as well as over the lives and manners of the citizens, and which, in dangerous emergencies, was even entitled to affirm the sedition and revolt of any of its members. See Lytias, Hecataeus, Anaxarchus, vol. i., and Gillies's Greece, vol. ii. Thus did the senate of the areopagus, and that of the four hundred, become two counterpoises sufficiently powerful to secure the republic against the storms from which all states are incessantly in danger (See Plutarch, in Solon); the former, by repelling the enterprizes of the rich by its general censure; and the latter, by restraining by its decrees and its presence the excesses of the multitude. New laws were enacted in support of these regulations. The constitution might be attacked either by the general factions which had so long agitated the different orders of the state, or by the ambition and intrigues of certain individuals. To guard against these dangers, Solon denounced punishments against those citizens who, in time of public commotion, refused openly to declare for one of the parties. (Plutarch, in Solon.) His view, in this admirable institution, was to rope men of merit and integrity from a state of fatal inactivity, to oppose them to the factions, and save the republic by the courage and ascendency of virtue. By a second law, every citizen convicted of having attempted to make himself master of the sovereign authority, was condemned to death. Lajily, in the case of an attempt to erect another government on the ruins of the popular form, this wise legislator could imagine but one method to reanimate the nation; and that was by obliging the magistrates to resign their employments; and hence this firm and menacing decree:—it shall be lawful for every citizen, not only to put to death a tyrant and his accomplices, but any magistrate who shall continue to exercise his functions after the destruction of the democracy. Such is the great outline of the constitution established by Solon, according to which every Athenian citizen enjoyed the inviolable privilege of being judged by his peers, and tried by laws to which he himself had assented. Although the legislative and judicial powers were thus lodged with the people, men of property and ability were alone entrusted with the administration of government; and as power in some measure followed property, the same expedient which served to maintain a due distinction of ranks in society, tended also to promote the industry and frugality of the multitude, that they might thereby become entitled to share those honours and offices to which persons of a certain estate only could aspire. (See Gillies, vol. ii. p. 114.) Conformable to this constitution was the code of laws which was framed by this illustrious legislator. As a system of jurisprudence, the institutions of Solon pollute extraordinary excellence. They have the merit of culy condescending with great variety and diffusiveness in the political fields, and are indeed well adapted to any limited government. Transplanted into the Roman law, they have, in the forcible and eloquent language of Dr. Gillies, grown after an interval of above sixteen hundred years, to abolish the barbarous practices of the Gothic nations, and to introduce justice, security, and refinement among the modern inhabitants of Europe. The laws of Solon consider the citizen in the various relations of domestic, civil, and political society. They accurately mark the duties belonging to these relations, and prescribe the rules for directing and enforcing the performance of them, and for preventing their violation. To form the citizen early to the highest and most beneficial to the community, the laws of Solon describe the plan of his education. They recommend the exercises corporal, intellectual, and moral, which tend
most powerfully to invigorate the bodily constitution; to enlarge, refine, and direct the understanding; to form, strengthen, and liberalize the heart. They strongly reprobate idleness, and recommend industry, pointing out the objects, private and national, for which it would be most usefully and honourably exerted. They forcibly inculcate temperance, and censure the contrary as a principal source of vice and misconduct. Although the Athenian law was transplanted into the Roman on many subjects; in several there is a very considerable difference. In Athens, the institutions regarding women, and the relations in which they are concerned, were much more liberal than those of Rome, although they still greatly short of those in modern times, when men respect the natural equality of the sexes. Solon considers marriage as an engagement of mutual love and affection, the ends of which are to give happiness to the family, and useful citizens to the state. He does not consider the wife, as the Romans afterwards did, as only part of the family property, which the husband, the proprietor, was to use as he pleased. He regarded her as the domestic companion of her husband, nearly equal to him in the care of the children: he rigorously punishes those who violate the obligations of the married state: he permits divorce, not according to the caprice of the husband, but after a diffusion before a magistrate: he permits women to separate from their husbands on the same ground as men from their wives. His law for the protection of unmarried women was highly equitable. Whoever seduced a woman of before unimpeached conduct, was, if unmarried, obliged to atone to her by marriage for the injury. On this law hinge the plots of most of Terence's plays. The married destroyer of virgin innocence was punished with a salutary rigour. The reciprocal duties of parent and child Solon did not leave to the mere operation of natural affection, but added positive laws. These enjoined parents to bestow such pains on the education of their children as might enable them to perform their various duties as men and citizens. They oblige children to maintain their parents in declining years, two cafes excepted; e.g. if the children had been born of a courtier, or had been educated to no profession. In the first case, they supposed that children owe nothing to parents who had begotten them to disgrace; in the second, who defined them to usefulness and dependence. Domestic tribunals were not permitted by Solon's laws. A citizen could only be judged by his peers, and by them only deprived of property, liberty, or life. The magistrates, civil, military, and ecclesiastical, were by Solon's laws entitled to respect and obedience, whilst they acted agreeably to the end of their office. (See Anacharsis, Gillies, and Aristotle's Politics.) These are a few of the outlines of the provision made by Solon's laws for maintaining what judge Blackstone styles the rights of persons. The laws of Solon respecting property were founded on principles of pure ethics, and regarded moral conduct as well as the preservation of property and political expediency. They considered private virtue as well as private right and public tranquillity; they not only provided that one man should not injure another, but endeavored to prevent such motives from exiling as tend to produce injury. Thus by the Athenian law, the next heir is incapable of being guardian to a minor, because it might be apprehended that such a guardian might be more disinclined to appropriating the inheritance than of promoting the good of the ward. That regulation therefore considers moral motives, and withholds temptations. All the institutions of Solon respecting successions and entailments united the two considerations of regard to property and to moral principle. Solon allowed the citizen to dispose of his property at pleasure; at the same time by his regulations he guards against the arts of legacy hunters; and thus, while he respects property, withholds motives to injustice. In that part of his code which treats of what the civilians termed aliis, and judge Blackstone private wrongs, Solon's description of injuries, and measures of redress, are nearly the same as in the Roman and English law. They all proceed upon a plain and obvious principle in ethics, that every injury done must be redressed. The injuries which may be done to an individual, affect either his liberty, property, character, or person, and are in general nearly the same in all countries. On this principle (says Gibbon, speaking of that branch of law), the civilians of every country have erected a similar jurisprudence, the fair conclusion of universal reason and justice. In that part which the civilians style penal law, and Blackstone public wrongs, Solon differs very considerably from the Roman law, and agrees with the English. This difference is partly in the description of crimes, and partly in the mode of cognizance. Public wrongs are either such actions or omissions as tend to affect the tranquillity and happiness of the state. The false actions therefore must be wrong in very different degrees in different states and circumstances. The perfection of a penal code depends on the connection in the description of laws, between crimes and public injuries in the first place; and in the second, between crimes and punishment. If every action which generally hurts the public, is by the laws a crime, and if the punishment be exactly in proportion to the crime, and be not inflicted without certain proof of the commission, that must be a good penal code. A wise lawgiver apportions punishment to crime, but does not consider punishment only; he also takes preventive into his consideration. One of the many great excellencies of our English law is, that it has adopted efficacious means for preventing crimes. To this branch of legislation Solon also had paid considerable attention. The prevention of crimes depends chiefly on two things; first, vigilance in observing the conduct of those who, either from their general character, or from particular circumstances, may be supposed most likely to commit them; secondly, on the previous care bestowed on the morals of the people. This last is undoubtedly the furest way of preventing crimes from being general. As a punishment, under the fames of contradiption, is Solon enacted a law which obliged every citizen to exercise some trade or profession. "None," says the learned and ingenious Drummond, "among the various institutions of Solon has been more deservedly celebrated than that which obliged every citizen to exercise some trade or profession. In countries where the climate naturally disposes men to sloth and inactivity, every law which incites the mind to exertion, or which rouhs the latent energy of its faculties, must necessarily be attended with the most salutary effects." This law had a tendency not only to prevent the negative evil of sloth, but the positive evil of active criminality. By the institutions of Solon, extravagance, intemperance, and debauchery underwent a severe animadversion. Magistrates were empowered to watch the buildings of notorious practices which might, if not checked, ripen into crimes. Solon's description of the various lands and meanders of crimes is very accurate, and the annexed punishment is generally proportionate. No action of pernicious tendency is by the Athenian laws exempted from penal animadversion. By the Roman law, suicide (according to the just and striking description of Blackstone, "the pretended heroism, but real cowardice of the Stoic philosophers, who destroyed themselves to avoid those ills which they had not the fortitude to endure") was not only not punished, but
was encouraged. The Solon's laws, the self-murderer was branded with public infamy, and exposed to what, according to the religious notions of his countrymen, constituted public punishment. Solon describes the various species of fraud, theft, robbery, and homicide with the greatest accuracy. Of the last in particular, the different shades from what our laws call chance medley, to premeditated, are delineated with a most discriminating precision. It is not only the description of crime, and the annexation of punishment, that is of importance in penal codes, but also the tribunal which is to take cognizance of the case. By Solon's laws, every Athenian citizen had a right to be tried by his peers; the Athenian law was in this superior to the Roman, which, in many cases, admitted domicilic tribunals. The father took cognizance of the crimes of his own family. Thus at Rome, the accused frequently was not tried by a tribunal of his peers, bound to act according to a fixed law, but by an arbitrary judge, whose will was his only rule. Solon, like every wise lawgiver, endeavored to extend the influence of religion over the minds of his countrymen. He enjoined a profound veneration for deities, and described actions as pleasing or displeasing to them, according to the intention of the agent combined with the known tendency of the act. He taught the Athenians that the internal foundations of religion are strengthened and confirmed by external rites. He strictly enjoined the regular performance of rites and ceremonies.

Such was the code of Solon, such the civil and political institutions which contributed so powerfully to render this small territory so very great a state. The laws of Solon were to continue in force only for a century. Conceiving that conduct depends chiefly upon habits, he thought that the practice of a hundred years would confirm the Athenians in the habitual observance of such beneficial rules. But the restrictions being contrary to the licence of strong passions, appeared to many encroachments upon natural liberty; and they wished for modifications which might admit fuller scope to their desires. When the first novelty was worn off, Solon was surrounded by a crowd of importunate citizens, who overpowered him with petitions, advice, communications, or approaches. Some prefaced him for an explanation of particular laws, capable, according to them, of different interpretations; others proposed a variety of things to be added, modified, or suppressed.

Solon having exhausted his patience, and tried every conciliatory method in vain, was sensible that time alone could perfect and give through to his work; he therefore departed, after requesting permission to absent himself for ten years (see Plutarch, in Solon), and binding the Athenians by a solemn oath, not to make any alteration in his laws during his absence. (See Herodotus, Cho.) The adventures of Solon during his peregrination, belonging to himself individually, and not to the Athenians, will be seen under the articles Solon, Crotus, &c. The objects of his travels being, as Herodotus informs us, to view mankind; after having, like Ulysses, traversed many countries, and seen many men, he returned to his native country to behold the operation and effects of his institutions. He found that much time is required before men, who had been either the slaves of despots or the sharers in licentiousness, can be reconciled to just and equitable laws. The Athenians were ready again to sink into anarchy. (See Plutarch's Life of Solon.) The three parties, which had for long rent the public, seemed to have suspended their hatred during the legislation, only to vent it with more violence in his absence; in one point alone were they united, in deferring a change in the constitution, without any other motive than a secret selfishness, or any object but vague hopes. Solon, received with the most distinguished honours, wished to avail himself of these favourable dispositions to calm dissensions too frequently revising. At first he thought himself powerfully incited by Philistatus, who was at the head of the popular faction; and who, apparently eager to maintain equality among the citizens, declared himself an irreconcilable enemy to every innovation which might tend to its destruction; but he soon discovered that this profound politician concealed the most insidious ambition under the mask of an affected moderation.

Never did a man unite more qualities to captivate the minds of the people: he was of an illustrious birth, and possessed of great wealth, acknowledged wealth (see Ithomotus, in Terpophilus, his 5th book); a commanding figure, a persuasive eloquence, to which the musical tone of his voice lent new charms, and a mind enriched with the ideas bestowed by nature, and the information procured by study. No man was a greater master of his passions, or knew better how to turn to advantage those virtues he really possessed, and those of which he had only the appearance. His talents has proved, that in projects of bold execution, nothing can hallow a more decided superiority than self-control and flexibility of character. With such eminent advantages, Philistatus, insensible to the blows of the citizens, divided on them those confusions and frouzes, in which he had so often, or palliated the bitterness of suffering. Solon, attentive to his proceedings, penetrated his intentions; but whilst he was employed in devising means to guard against their consequences, Philistatus appeared in the forum covered with wounds he had artfully procured, imploring protection of the people whom he had so frequently protected. (See Herodotus, Cho.) The assembly being immediately convoked, he accused the senate and the chiefs of the other factions of attempting his life; and displaying his still bleeding wounds: "Behold!" he exclaimed, "the reward of my love for the democracy, and of the zeal with which I have defended your rights." At these words only menacing exclamations were heard on all sides; the principal citizens kept silence in astonishment, or took to flight. Solon, filled with indignation at their cowardice and the insurrection of the people, in vain attempted to reanimate the courage of the former, and to dispel the frenzy of the latter; his voice, enfeebled by years, was easily overpowered by the clamours excited by pity, rage, and apprehension. The assembly concluded by voting Philistatus a strong guard for the defence of his person (B.C. 560). From this moment all his projects were accomplished; he presently employed his force to take possession of the citadel, and after disarming the multitude, seized without opposition on the supreme authority. But though Philistatus by this usurpation destroyed for a time the political liberty of Athens, his power eventually gave liability to the laws which Solon had introduced. That extraordinary tyrant, for so the Greeks styled him, was not more distinguished by the loftiness of his genius, than the humanity of his disposition; and had not the violence of contending factions, and the fury of his enemies, inflamed his natural love of power, the name of Philistatus would stand the foremost in the list of Greek patriotic heroes. His valour and conduct were signalized in the conquest of Naxos, Salamis, Naxos, Delos, and Sigeum; and if he displayed boldness and address in acquiring sovereignty, he displayed still more moderation and virtue in administering it. He assumed, indeed, the royal dignities of priest and general, and took care that the chief offices of magistracy should be filled by his partisans; but he maintained the regular course of law and justice, not only by his authority, but by his example; having appeared in per-
A TH E N S.

ion to answer an accusation in the areopagus. He not only
enforced the laws of Solon against idlers, but endeavoured
to give them more efficacy, by introducing new arts and
manufactories into Attica. He was the first who brought
into that country the complete collection of Homer's poems,
which he commanded to be sung at the Panathenian festi-
vals: nor can we suppose that he would have been willing
to diffuse the liberal and manly sentiments of that divine
poet, if his government had not reimbursed the moderation
and equity of the heroic ages, rather than the deposition
of tyrants. (See Gillies's Greece, vol. ii. 117.) His son Hip-
parchus initated and surpased the mild virtues of his father;
and amidst the turbulence of the latter democracy, it was
acknowledged with a sigh by the Athenians, that their an-
ccestors were indeed happy under Solon and Pisistratus, but
that the reign of the tyrant Hipparchus brought back on
earth the golden days of Saturn. The father had required
a tenth part of the produce of Attica, to support his
guards, and the other appendages of royalty: his more
generous son remitted one half of this impostion. While he
alleviated the burdens, yet encouraged the industry of
his subjects, by building the temple of Olympian Jupiter,
he was solicitous to dispel their ignorance and barbarity, by
erecting pillars in every part of the city, engraved with el-
geic verses, containing lesson of wisdom, and precepts of
morality. He collected the first library in Athens; and his
liberal rewards, and still more his agreeable manners and
willing affability, attracted to that city the most distin-
guished poets of the age. The murder of Hipparchus ex-
aperrated the temper of his brother and vacefolor Hippias;
but, notwithstanding the calamities which the latter inflicted
and suffered, it must be allowed that the government of Pi-
sistratus and his family, which, with various interruptions,
lasted sixty-eight years, increased the strength and promoted
the reformation of Athens. (See Gillies's Greece, vol. ii.
118.)

Hipparchus, in particular, was fond of letters. Ana-
creon and Simonides, invited to his court, met with a most
flattering reception: the first being loaded with honours,
and the second with presents. He desirous also to partici-
pate with his father in the glory of extending the fame of
Homer. He may be reproached, as well as his brother,
with too freely abandoning himself to pleasures, and with
inspiring the Athenians with a taste for luxury. Fortunate,
nevertheless, if in the midst of these excesses he had not com-
nitted an act of injustice, of which he was the first victim!
Two young Athenians, Harmodius and Aristogiton, united
in bonds of the tenderer friendship, having received from this
prince an affront it was impossible to forget, confired his de-
struction, and that of his brother. Some of their friends en-
tered into this conspiracy, and its execution was fixed for the
solemnity of the panathenaen: they hoped that the crowd of
Athenians, who, during the ceremonies of this festival, were
permitted to bear arms, would second their efforts, or at
least protect them against the fury of the guards who at-
tended on the sons of Pisistratus. With this view, after
covering their poignards with branches of myrtle, they re-
paired to the place where the princes were arranging a pro-
cession, which they were to precede to the temple of Minerva.
When they arrived, they saw one of the conspirators in familiar
conversation with Hippias, and concluded themselves
betrayed: but resolvent dearly to fell their lives, retired for
a moment, and finding Hipparchus plunged a dagger in his
heart. Harmodius instantly fell beneath the redoubled
blows of the prince's guards. Aristogiton, seized almost
at the same instant, was put to the torture; but far from
name his accomplices, he acceded the most faithful parti-
fans of Hippias, who ordered them to be dragged to instant
punishment. "Halt thou still other wrote to discover,"
exclaimed the tyrant, transported with fury. "There are
none left but thee," replies the Athenian; "I die, and
enjoy in death the satisfaction of having deprived thee of thy
beloved friends." From that moment Hippias abandoned him-
self to the perpetration of every kind of injustice (Thucyd-
des b. 6. c. 59.); but the yoke he laid dearon the Athenians
was broken three years after. (B. C. 512.) Chaldæns,
chief of the Alesamones, a powerful house of Athens, at
all times inimical to the family of Pisistratus, collected all
the maleccon tents about his person; and having obtained
the affiance of the Lacedæmonians, by means of the Pythia
of Delphi, whom he had gained over to his interest, marched
against Hippias, and forced him to abdicate the tyranny.
No sooner had the Athenians recovered their liberty, than
they rendered the highest honours to the memory of Har-
modius and Aristogiton. Statues were erected to them
in the forum; it was enacted that their names should be for
ever celebrated at the festival of the panathenaeon, and that,
on no pretext whatever, be given to slaves. The poets
eternized their glory by poems and songs, and very extensive
privileges were granted in perpetuity to their descendants.
Chaldæns, who had so greatly contributed to the expulsion
of the Pisistratide, had still to struggle for many years
against a powerful faction; but at length obtaining in the
vote the authority to which he was entitled by his great
talents, he confirmed the constitution established by Solon,
which the Pisistratide had never attempted entirely to sub-
vert. (Anacreon's Travels, vol. i. p. 174.) The power of
Athens was great in ancient times; but it became incompar-
able greater after the re-establishment of freedom. So
advantageous to the powers of the human mind is the enjoy-
ment of liberty, even in its least perfect form, that in a few
years after the expulsion of Hippias, the Athenians acquired
an ascendant in Greece, which was fatal to their enemies,
profitable to their rivals, and even dangerous to themselves.
They chastified the insolence of the illans of Eubea and
Ægina, who contended with them in naval power; and
humbled the pride of Thebes, which rivalled them in mili-
tary glory. Favoured, as they fromely believed, by the
protection of their tutelary Minerva; and animated, as they
strongly felt, by the possession of an equal freedom; they
adorned their capital with the richest spoils of their van-
quished enemies. Their influence soon extended over the
northern parts of Greece; and the fame of their power,
still greater than their power itef, alarmed the fears and
jealousy of the Peloponnesians. The Spartans, in par-
cular, who had allied them in restoring the democracy,
now perceived the error of which they had been guilty, in
promoting the greatness of an ambitious rival. In order to
prevent the dangerous consequences of their folly, they
summoned to a congress all their allies in Peloponnesus, that
their united wisdom might concert proper measures for re-
filing; ere it was too late, the encroachments of the Athe-
nians, which threatened the liberties of all Greece. Their
allies readily obeyed the welcome summons, and the deputies
of the several states, having assemhed in the Spartan forum,
eagerly listened to the speakers appointed to explain the in-
tentions of that republic. The Lacedæmonian orators ac-
knowledged the mildness of their policy, in expelling
from Athens the family of Pisistratus, and delivering the
government of that city into the hands of an unacquainted
people, who had once treated them with much indulgence.
But why (they proceed,) should we relate private injures?
Have they not inflicted all their neighbours? Does not their
pride daily increase with their power? And is there not
reason
reason to dread, that their growing ambition may endanger,
and at length destroy, the public safety? In order to prevent
this evil, we have recalled Himippos from banishment. And
let us, therefore, by our united efforts, reinstate the son of
Pisistratus in that power and authority of which we most
injustically deprived him. The speech of the Lacedemoni-
ans produced not the intended effect. The Peloponnesians,
however jealous of the Athenian greatness, were still more
jealous of the power of tyrants; and many of them, who
had experienced the hardships of Sparta, were not disas-
tisfied with beholding a rival to that republic in the northern
division of Greece. The other deputies expressed their
difficult by silent disapprobation; but Sosicles, the Corinthian,
declared his sentiments at great length, in a speech which
alike marks the manly character of the age, and the youth-
ful vigour of Grecian eloquence. "Then, surely, Laceda-
emonians, will the heavens fink below the earth, and the
earth rise sublime in the air; men will inhabit the depths of
the sea, and fishes will take possession of the land; when
you, formerly the bulwarks of liberty, shall demolish the
popular governments of Greece, and establish tyrannies in
their room, than which nothing can be more unjust or more
pernicious." After this pompous exordium, the Corinthian
proceeded to describe and exaggerate the calamities which
his own countrymen had suffered from the usurpation of
Cyphes, and his son Periander. Having related, at great
length, the proud, cruel, and detestable actions of those
princes; "Such," added he, "are the genuine fruits of
absolute power; but I adjure you, by the Grecian gods!
attempt not to re-establish it in Athens. The Corinthians
were feized with amazement when they heard that you had
sent for Himippos; I myself was amazed at beholding
him in this assembly; yet we never suspected that you pro-
posed to restore him, in triumph, to his much injured city.
If you still persist in this fatal resolution, know that the
Corinthians disavow all part in a design equally unjust and
impious." The other deputies listened with pleasure to the
boldness of Sosicles, who expressed the sentiments which
they themselves felt, but which their respect for the Laceda-
emonians obliged them to conceal. Himippos alone opposed
the general voice of the assembly, attacking the fame gods
which his opponent had invoked, and prophesying, that at
some future time the Corinthians would repent of their present
conduct, and regret their cruel injustice to the son of
Pisistratus, when their own citizens, as well as the rest of Greece,
should mutually experience the dangerous ambition of Athens.
This remonstrance, which was so fully justified in the
sequel, produced no immediate effect in the assembly; the
Lacedemonians finally yielded to the general requisition of
their confederates, and abjured from their intended innova-
tion in the government of a Grecian city.

The deposed prince, finding his cause abandoned by the
Greeks, sought the protection of Artaphernes, the Per-

(See Herodotus, book vi.) Precisely at this juncture (B.C. 591.) Artilagoras arrived at Athens, explained the revolt of the Asiatic Greeks from the government of Artaphernes, and solicited the assistance of the Athenians, in defending
their own colonies against the oppressive violence of the
common foe. Many arguments were not necessary to make
the people of Athens adopt a measure which gratified their
own passions. The eloquent Miltiades, however, described
the wealth and extent of Persia, the grandeur and popu-
lness of its cities, and above all, the fleuthful effeminacy
and polished manners of their inhabitants, who, unable
to support the ponderous shield, or to poise the manly
spear, invited as an easy prey, the victorious arms of a
more warlike invader. The speech of Artilagoras was well
fitted to excite the ambition and avarice of Athens. The
assembly immediately decreed that assistance should be sent
to Ionia. Twenty ships were fitted out with all convenient
speed, which reinforced by five more belonging to Eretria,
a town of Euboea, rendezvoused in the harbour of Miletus.
Artilagoras spent not long time in his embassy to the other
states of Greece, and soon met the Athenian allies at the
place appointed. It was here determined, that while the
commander in chief regulated the civil affairs of the Ionians,
his brother Charopinus should conduct a military expedition
against the wealthy capital of Lydia. The Athenians,
delirous of testifying their resentment against the common
enemy, and still more delirious of plunder, eagerly engaged
in this undertaking. The united fleets left the harbour
of Miletus, and failed to Ephesus, where the troops were
disembarked; and, in three days, accomplishing a journey
of seventy miles, appeared before the walls of Sardis. The
Perian governor little expected such a visit; his soldiery
were not prepared to take the field; and the extensive
walls of the city could not be defended on all sides against
the besiegers; and the Greeks, without opposition, entered
Sardis, in order to plunder the accumulated wealth of that
ancient capital. But an accident prevented them from reap-
ing the fruits of their successe. The reinforcement of a
pauper, disappointed of his prey, set fire to the house
of a Lydian, situate on the skirts of the town which con-
stituted for the most part of very combustible materials,
the houses being all roofed, and many of them walled with
cane; a mode of building doubly dangerous in that humid
climate. The flames readily communicated from one house
to another; and, in a short time, the whole circumference
of the place was surrounded with a wall of fire. Sardis
was built in the Grecian, not in the Eastern fashion, having
on the banks of the Pactolus, which intersected the town,
a spacious quay, which commonly served for the market-
place. Thither the Persians, driven from their extremities,
betook themselves to refuge against the fury of the flames.

Darius was extremely enraged against the Greeks, and
especially the Athenians, for having abetted revolt among
his subjects. The proud monarch of the East, when in-
formed that the citizens of Athens had co-operated with the
Ionians, in the taking and burning of Sardis, discovered
evident marks of the most furious resentment; shooting an
arrow into the air, he prayed that heaven might afflict him
in punishing the audacious infortune of that republic; and
every time he sat down to table, an attendant reminded him
of the Athenians, left the delight of Eastern luxury should
mislead him from his real purpose of revenge. The execution
of his design was entrusted to Mardonius, a Perian noble-
man of the first rank, whose personal as well as hereditary
advantages had entitled him to the marriage of Artazostra,
dughter of Darius; and whose youth and inexperience were
compensated in the opinion of his master, by his
superior
A TH E N S.

superior genius for war, and innate love of glory. In the
second spring after the cruel punishment of the Ionians, Mardonius approached the European coast with an armament sufficient to inspire terror into Greece. The rich island of Thasos, whose golden mines yielded a revenue of near three hundred talents, submitted to his fleet; while his land forces added the barbarous province of Macedon to the Persian empire. But having fleetly forti with Thasos, the whole armament was overtaken and almost destroyed by a violent storm, while endeavouring to double the promontory of Mount Aetna, which is connected with the Macedonian shores by a narrow neck of land, but forms a long and lofty ridge in the sea. Three hundred vessels were dashed against the rocks; twenty thousand men perished in the waves. This disaster totally defeated the design of the expedition, and Mardonius having recovered the scattered remains of his fleet and army, returned to the court of Persepolis by flatterling the pride, he avowed the submission of Darius; while he represented, that the Persian forces, invincible by the power of man, had yielded to the fury of the element. The address of Mardonius induced him from punishment; but his misfortunes removed him from the command of Lower Asia. Two generals were appointed in his room, of whom Datis, a Mede, was the more distinguished by his age and experience, while Artaphernes, a Persian, was the more conspicuous for his rank and nobility, being descended of the royal blood. That is lieutenant might appear with a degree of splendor suitable to the majesty of Persepolis, Datis assembled an army of 120,000 men, composed of the flower of the provincial troops of his empire. The preparation of an adequate number of transport vessels and ships of war occasioned but a short delay. The maritime provinces of the empire, Egypt, Phœnicia, and the coasts of the Euxine and Ægean seas, were commanded to fit out, with all possible expedition, their whole naval strength; the old vessels were repaired, many new ones were built; and in the course of the same year in which the preparations commenced, a fleet of six hundred sail was ready to put to sea. This immense armament the Persian generals were ordered to employ in extending their conquests on the side of Europe, in invading the republics of Greece, and more particularly in chastising the insolence of the Athenians and the Aetians, the only nation in which he had confided with the revolt of the Ionians, and affrighted that rebellious people in the destruction of Sardis. With respect to the other nations which revolted, reduced by his arms, the orders of Darius were general, and the particular treatment of the vanquished was left to the discretion of his lieutenants; but concerning the Athenians and Etruscans, he gave the most positive commands that their territories should be laid waste, their housetops burnt and demolished, and their persons carried in captivity to the extreme extremities of his empire. Secure of effecting this purpose, his generals were furnished with a great number of chains for confining the Grecian prisoners; a haughty preemption (to use the language of antiquity), in the superiority of man over the power of fortune, which on this, as on other occasions, was punished by the just vengeance of heaven. (B.C. 490.) The Persian fleet entered a prosperous voyage to the isle of Samos, from whence they were ready to proceed to the Athenian coast. The late disaster which befell the armament commanded by Mardonius, deterred them from pursuing a direct course along the shores of Thrace and Macedonia; they determined to fly in a direct line through the Cyclades, a cluster of seventeen small islands lying opposite to the territories of Argos and Attica. The approach of such an immensurable host, whose transports darkened the broad surface of the Ægean, struck terror into the unwary inhabitants of those delightful islands. The Naxians took refuge in their inaccessible mountains. The natives of Delos, the favourite residence of Latona and her divine children, abandoned the lawful majesty of their temple, which was overshadowed by the rough and lofty mount Cythnus, Paros, famous for its marble; Andros, celebrated for its vines; Cos, the birth-place of the plaintive Simonides; Syros, the native country of the ingenious and philosophic Thersycles; Ios, the tomb of Homer; the indolent Amorgos; as well as all the other islands which surrounded the once sacred shores of Delos, either spontaneously offered the usual acknowledgment of earth and water as a token many of their friendship, or submitted, after a feeble resistance, to the Persian arms. The invaders next proceeded westward to the island of Eubœa, where, after a more confined engagement of six days, their strength and numbers, checked by the perfidy of two traitors, finally prevailed over the valour and obstinacy of the Eubœans. Hitherto every thing was prosperous; but a more difficult task remained, in the execution of which the Persians (happily for Europe) experienced a fatal reverse of fortune. After the reduction of Eubœa, the Athenian confederates, separated from that island only by the narrow strait of Euripus, seem ed to invite the generals of Darius to an easy conquest. They readily accepted the invitation, as the punishment of Athens was the main object which their master had in view when he fitted out his seemingly invincible armies. The menaces which they adopted for accomplishing this design appear abundantly judicious; the greater part of the army was left to guard the islands which they had subdued; the useless multitude of attendants were transported to the coast of Asia; with a hundred thousand chosen infantry, and a due proportion of horse, the Persian generals set sail from Eubœa, and safely arrived on the Marathonian shores, a district of Attica, about thirty miles from the capital, confining chiefly of level ground, and therefore admitting the operations of cavalry, which formed the main strength of the barbarian army, and with which the Greeks were very poorly provided. Here the Persians pitched their camp, by the advice of Hippias to the humiliation of Athens, whose posterity knew, that when he fitted out his seemingly invincible armies. The menaces which they adopted for accomplishing this design appear abundantly judicious; the greater part of the army was left to guard the islands which they had subdued; the useless multitude of attendants were transported to the coast of Asia; with a hundred thousand chosen infantry, and a due proportion of horse, the Per ian generals set sail from Eubœa, and safely arrived on the Marathonian shores, a district of Attica, about thirty miles from the capital, confining chiefly of level ground, and therefore admitting the operations of cavalry, which formed the main strength of the barbarian army, and with which the Greeks were very poorly provided. Here the Persians pitched their camp, by the advice of Hippias the humiliated king of Athens, whose posterity knew, that when he fitted out his seemingly invincible armies.
No sooner were the troops assembled, than they marched out of the city into the plain of Marathon, where the inhabitants of Plataea sent them a reinforcement of a thousand infantry. Scarcely were the two armies in sight of each other, before Miltiades proposed to attack the enemy; Aristides, and several of the commanders, warmly supported this measure; but the rest, terrified at the excessive disproportion of the armies, were dreading for success from Lacedaemonia. Opinion being divided, they had recourse to that of the hoplarch, or chief of the militia, who was consulted on such occasions to put an end to the equality of suffrages. Miltiades addressed himself to him with the ardour of a man deeply impressed with the importance of present circumstances; "Athenians (said he) is on the point of experiencing the grandeur of victorious, or the theatre of the tyranny and fury of Hippias: from you, alone, Callimachus, the now awaits her deliver. If we suffer the armies of the Persians to cool, they will shamefully bow beneath the Persian yoke; but if we lead them on to battle, the gods and victory will favour us. A word from your mouth might now precipitate your country into slavery, or preserve her liberty." (See Herodotus, i. vi. c. 109.) Callimachus gave his suffrage, and the battle was resolved. To ensure success, Aristides and the other generals after his example, yielded to Miltiades the honour of the command which belonged to them in rotation; but, to secure them from every hazard, he preferred waiting for the day which of right placed him at the head of the army. When that day arrived, Miltiades drew up his troops at the foot of a mountain, on a spot of ground scattered over with trees, to impede the Persian cavalry. The Plataeans were placed on the left wing; Callimachus commanded the right; Aristides and Themistocles were in the centre of the battle, and Miltiades everywhere. (See Herodotus, i. vi.) At the first signal, the Greeks advanced over this space running. The Persians astonished at a mode of attack so new to both nations, for a moment remained motionless; but, to the impetuous fury of the enemy, they soon opposed a more sedate and not less formidable fury. After an obstinate conflict of some hours, victory began to declare herself in the two wings of the Greek army. The right dispersed the enemy in the plain, while the left drove them back on a morass that had the appearance of a meadow, in which they stuck tall and were lost. But the bodies of troops now met on the front of our forces, and the forces of Aristides and Themistocles, ready to give way for the flower of the Persian troops, placed by Datæ in the centre of his battle. From this moment the rout became general. The Persians, repulsed on all sides, found their only asylum in the fleet, which had approached the shore. The conquerors pursued them with fire and sword, and took, burnt, or sunk, the greater part of their vessels; the rest escaped by dint of rowing. The blood-stained tyrant of Athens fell that day in the engagement; two Athenian generals, and about two hundred citizens, were found among the slain: the Persians left six thousand of their boats troops in the scene of action. The joy excited among the Athenians by a victory, which not only delivered them from the dread of their enemies, but raised them to distinguished pre-eminence among their rivals and allies, is evident from a remarkable incident which happened immediately after the battle. As soon as fortune had visibly declared in their favour, a offer was dispatched from the army to convey the welcome news to the capital. He ran with incredible velocity, and appeared, covered with dust and blood, in the presence of the senators: exulting in fatigue conjoined with the transports of enthusiasm to exult the vigour of his frame; he had only time to exclaim in two words, "Rejoice with the victors!" and immediately expired. The Athenians neglected nothing to exalt those who fell in the battle. Honorable funerals were performed on them; their names were engraved on half columns erected on the plain of Marathon. In the intervals between them were erected trophies bearing the arms of the Persians. An artist of eminence painted all the circumstances of the battle in one of the most frequented portions of the city: Miltiades was there represented at the head of the generals, and in the act of exhorting the troops to fight for their country. The highest plumes were bestowed upon Miltiades, and he was appointed commander of an expedition against the Persian garrisons. The first operations of the Athenian armament were crowned with success. Several islands were subdued, and considerable sums of money collected. But the fleet arriving before Paros, every thing proved adverse to the Athenians. The Persians made a very vigorous defence; their strength, however, began to decline, and they must have been overpowered, but for a fortunate accident. An extensive grove, happening to be set on fire in a neighbouring island, was believed by the beholders to indicate the approach of a Persian fleet. The same opinion gained ground among the Persians, who, determined by their utmost efforts to preserve the place until they should be relieved by the assistance of their protectors. Miltiades had received a dangerous wound during the siege; and the weakness of his body impairing the faculties of his mind, he gave orders to draw off his victorious troops, and returned with the whole fleet to Athens. The Athenian citizens, and particularly the more eminent and illustrious, had universally rivals and enemies. The competitions for civil offices, or military command, occasioned eternal animosities among those jealous republicans. Xanthippus, a person of great dilution, and father of the celebrated Pericles, who, in the succeeding age, obtained the first rank in the Athenian government, eagerly seized an opportunity of depriving the character of a man which had so long surpasse of every competitor. He was accused of suffring himself to be corrupted by Persian money, and notwithstanding the solicitations of the most virtuous citizens, was condemned to be thrown into the dungeon in which malefactors are left to perish. The magistracy opposing the execution of this infamous decree, his punishment was commuted into a fine of fifty talents; and as he was unable to pay this sum, Athens saw the vanquisher of Darius expire in chains of the wounds he had received in the service of the state. But the glory of Miltiades survived him; and the Athenians, however unjust to his person, were not unmindful of his fame. At the distance of half a century, when the battle of Marathon was painted by order of the state, they directed the figure of Miltiades to be placed in the fore ground, animating the troops to victory; a reward which, Dr. Gillies observes, "during the virtuous simplicity of the ancient commonwealth, conferred more real honour than all that magnificent profusion of crowns and statues, which, in the later times of the republic, were rather exorted by general fear, than bestowed by public admiration." "The jealousies continue the same author, retaliations, dangers, and calamities, which often attend power and pre-eminence, have never yet proved sufficient to deter an ambitious mind from the pursuit of great objects." The rivals of Miltiades were animated by the glory of his elevation, but depreted by the example of his fall. His accuser, Xanthippus, though he had acted the principal part in removing this favourite of the people, was not deemed worthy to succeed to his power.
Two candidates appeared for the public confidence and esteem, who stridently outstripped each other in the race of ambition, and whose characters deserve attention even in Athenian history, as they had a powerful influence on the fortune of Athens. (See Dr. Gillies's History of Greece, vol. i. p. 407.) The character of Aristeides has been already seen in biographical detail (see article Aristeides); here it is to be viewed merely in its combination with events and with characters which affected the history of Athens.

The character of Themistocles was of a more noble kind. The trophy, which Miltiades had raised at Marathon, disturbed his rest; he was inflamed with a desire to emulate the glory of this exploit; and while he enabled Athens to maintain a superiority in Greece, he was ambitious to acquire for himself a supremacy in Athens. His talents were well adapted to accomplish both these purposes; eloquent, active, enterprising, he had throughout his natural endowments by all the force of education and habit. Laws, government, revenue, and arms, every branch of political and military knowledge, were the great objects of his study. In the courts of justice he successfully displayed his abilities in defence of his private friends, or in accusing the enemies of the state. He was forward to give his opinion upon every matter of public deliberation; and his advice, founded in wisdom, and supported by eloquence, commonly prevailed in the assembly. Yet with all these great qualities, his mind was left unshaken with the native charms of virtue, than captivated with her splendid ornaments. Glory was the idol which he adored; he could injure, without remorse, the general cause of the confidence, in order to promote the grandeur of Athens; and history still leaves it as doubtful, as did his own conduct, whether, had an opportunity offered, he would not have sacrificed the happiness of his country to his private interest and ambition. The分娩ment of Aristeides perceived the danger of allowing a man of such equivocal merit to be entrusted with the sole government of the republic; and on this account, rather than from any motives of personal animosity, he opposed every measure that might contribute to his elevation. In this patriotic view, he frequently solicited the fame honours which were ambitiously courted by Themistocles, especially when no other candidate appeared capable of balancing the credit of the latter. A rivalry thus began, and long continued between them; and the whole people of Athens could only decide the much coveted pre-eminence, by the choice of Themsitocles. He far prevailed over the authority of his opponent, that he procured his own nomination to the command of the fleet; with which he effected the conquest of the small islands in the Aegean, and thus completed the design of Miltiades. While he acquired fame and fortune abroad, Aristeides increased his popularity at home. The opposition to his power, arising from the splendid eloquence and popular manners of his rival, was now fortunately removed, and he became the chief leader of the people. His opinion gave law to the courts of justice; or rather such was the effect of his equity and discernment, he alone became sovereign umpire in Athens. In all important decisions he was chosen arbitrator, and the ordinary judges were deprived of the dignity and advantages formerly resulting from their office. This consequence of his authority, offending the pride of the Athenian magistrates, was sufficient to excite their resentment; which, of itself, might have effected the ruin of any individual. But their views on this occasion were powerfully promoted by the triumphant return of Themistocles from his naval expedition. The admiral had acquired considerable riches; but wealth he despised, except as an instrument of ambition. The spoils of the conquered islands were profusely lavished in shows, festivals, dances, and theatrical entertainments, exhibited for the public amusement. His generous manners and flowing affability were contrasted with the stern dignity of his rival; and the result of the comparison added great force to his inscription, that since his own necessary absence in the service of the republic, Aristeides had acquired a degree of influence inconsistent with the constitution; and, by arrogating to himself an universal and unexampled jurisdiction in the state, had established a silent tyranny, without pomp or guards, over the minds of his fellow-citizens. Aristeides, trouncing to the innocence and integrity of his own heart, disdained to employ any unworthy means, either for gaining the favour, or for averting the resentment, of the multitude. The contest, therefore, ended in his banishment for ten years, by a law intitled the Ostracism (from the same of the materials on which votes were marked), by which the majority of the Athenian assembly might expel any citizen, however injurious or meritorious had been his past conduct, who, by his present power and greatness, seemed capable of disturbing the equality of republican government. This singular institution, which had been established soon after the Athenians had delivered themselves from the tyranny of Hippias, the son of Pisistratus, was evidently intended to prevent any person in future from attaining the fame unlawful authority. At Athens, even virtue was proscribed, when it seemed to endanger the public freedom; and only four years after the battle of Marathon, in which he had displayed equal valor and wisdom, Aristeides, the just and most respectable of the Greeks, became the victim of popular jealousy; an example of cruel rigour, which will for ever brand the spirit of democratical policy. The banishment of Aristeides exposed the Athenians still more than formerly to the danger which they hoped to avoid by this severe measure. The removal of such a formidable opponent enabled Themistocles to govern without control; army, navy, and revenue, all were submitted to his inspection. It happened, indeed, most fortunately for the fame of this great man, as well as for the liberty of Athens, that his active ambition was called to the glorious talk of subduing the enemies of his country. The smaller islands in the Aegean were already reduced to obedience; but the possession of them was uncertain while the fleet of Aegina covered the sea, and bad defiance to the Athenians. This small island, or rather this rock, inhabited by mere fishermen, the best situation in the Saronic gulph, which divides the territories from the northern shores of Peloponnesus, was a formidable enemy to the republic; the jealousy of commerce and naval power embittered their mutual rivalry; and as the inhabitants of Aegina, who were governed by a few leading men, had entered into an alliance with the Persians, there was every circumstance united which could provoke to the utmost the hatred and resentment of the Athenians. A motive less powerful than the excesses of republican antipathy could not probably have prevailed on them to embrace the measure which they now adopted by the advice of Themistocles. There was a considerable revenue arising from the silver mines of mount Laurium, which had been hitherto employed in relieving the private wants of the citizens, or dissipated in their public amusements. This annual income Themistocles persuaded them to define to the useful purpose of building ships of war, by which they might seize or destroy the fleet of Aegina. The proposal was approved, an hundred galleys were equipped, the naval strength of Aegina was broken, and success animated the Athenians to aspire at obtaining the unrivalled empire of the sea. Corcyra formed the only remaining obstacle to their ambition. This island, which,
which, under the name of Phœcia, is celebrated by Homer for its amazing riches and fertility, had been full further improved by a colony of Corinthians. It extends an hundred miles along the western shores of Epirus, and the natural abundance of its productions, the convenience of its harbours, and the adventurous spirit of its new inhabitants, gave them an undisputed advantage over their neighbours in navigation and commerce. They became successively the rivals, the enemies, and the superiors of Corinth, their mother country; and their successful cruises infected the coasts and disturbed the communication of the islands and continent of Greece. It belonged to Athens, who had for the time been perished, the pernicious of Zegina, to chastise the infirmity of the Corecyans. The naval depredations of these islanders made them be regarded as common enemies; and Themistocles, when, by seizing part of their fleet, he broke the fines of their power, not only gratified the ambition of his republic, but performed asignal service to the whole of the Grecian confederacy. Victorious by sea and land, against Greeks and Barbarians, Athens might now seem entitled to enjoy the fruits of a glorious security. It was generally believed in Greece, that the late disfaster of the Persians would deter them from invading a second time the coasts of Europe. But Themistocles, who, in the words of Thucydides (lib. i.), was no less fagacious in facing the future, than in managing the present, regarded the battle of Marathon not as the end of the war, but as the prelude to new and more glorious combats. He continually exhorted his fellow-citizens to keep themselves in readiness for action; above all, to increase, with unremitting affability, the strength of their fleet; and, in consequence of this judicious advice, the Athenians were enabled to oppose the immense armaments of Xerxes (of which the most formidable tidings soon arrived from every quarter), with two hundred galleys of a superior size and construction to any hitherto known in Greece. (See Gillies's Greece, vol. 1. p. 414.) Meanwhile the reduction of revolted provinces had given employment and luftre to the Persian army. Nine years after the battle of Marathon, and in the fourth year of his reign (B.C. 481.), Xerxes found himself uncontrolled master of the East, and in possession of such a fleet and army as flattered him with the hopes of universal empire. The three last years of Darius were spent in preparing for the Grecian expedition. Xerxes, who needed to his fleet and to his revenue, dedicated four years more to the same hostile purpose. Amidst his various wars and pleasures, he took care that the artifices of Egypt and Phœnia, as well as all the maritime provinces of Lower Aia, should labour with unremitting diligence, in fitting out an armament adequate to the extent of his ambition. Twelve hundred ships of war, and three thousand ships of burthen, were at length ready to receive his commands. The former were of a larger size and firmer construction than any hitherto seen in the ancient world: they carried on board, at a medium, 200 seamen and thirty Persians who served as marines. The ships of burthen contained, in general, eighty men, fewer being found incapable of rowing them. The whole amounted to 42,000 ships and about 500,000 men, who were ordered to rendezvous in the most secure roads and harbours of Ionia. We are not exactly informed of the number of the land forces, which were assembled at Sûfa. It is certain however, that they were extremely numerous, and it is probable that they would continually increase on the march from Sûfa to Sardis, by the confluence of many tributary nations, to the Imperial standard of Xerxes. The Persian army consisted of 1,700,000 infantry, and 58,000 cavalry, besides 20,000 Arabian, riders of camels, and Libyan charioteers: when to there were added sailors and marines, the number amounted to 2,317,610: this was the number of fighting men whom Xerxes brought from Asia, exclusively of attendants and slaves. Besides, there were immense numbers of women and cannibals, who, according to eastern luxury and debauchery, followed the camp, in all the ostentatious pageantry and fabulous magnificence of despotick pomp: so that to use the words of the animated Bartholdi, 5,000,000 had been torn from their native homes, and were preparing to destroy whole nations, to gratify the ambition of an individual named Mardonius. In Europe he was joined by 500,000 of Thraceans, Macedonians, and northern Greeks, who meanly deserted their brave countrymen of Sparta and Athens; so that the whole exceeded 2,800,000 men. (This account is translated from Herodotus, i. vi.) The number of this army, as recorded by the soft Greek historian, has never been equalled by any of ancient or modern times, from Herodotus to his literary descendant Gilles. But little availed the bodies of Asian slaves, against the souls of European freemen. Having wintered at Sardis, he sent ambassadors to demand the tenth water, as a mark of submission, from all the Grecian states except Athens and Sparta, whom he presumptuously referred for the severest punishment. (B. C. 480.) The slow march of his immense army, and, full more, its tedious transportation across the seas which separate Europe from Asia, ill suited the rapid violence of his revenge. Xerxes therefore ordered a bridge of boats to be raised on the Hellefont, which, in the northern part, is only seven miles, or seven eighths of a mile in breadth. Here the bridge was formed with great labour; but whether owing to the awkwardness of its construction, or to the violence of a succeeding tempest, it was no sooner built than destroyed. The great king ordered the directors of the work to be beheaded; and, proud of his tyrannical power over feeble men, displayed an impotent rage against the elements. In all the madness of despotism, he commanded the Hellefont to be punisht with 500 horses, and a pair of setters to be dropped into the sea; adding these frantic and ridiculous expressions:—"It is thus, thou falt and bitter water, that thy murderer punishes thy unprovoked injury; and he is determined to pull thy treacherous streams, notwithstanding all the influence of thy malice." After this abortive ceremony, a new bridge was made of a double range of vessels, fixed by strong anchors on both sides, and joined together by cables of hemp and reed, fastened to immense beams driven into the opposite shores. The decks of the vessels, which exceeded 600 in number, were strewed with trunks of trees and earth, and their surface was still farther smoothed, by a covering of planks. The sides were then raised with wicker work, to prevent the fear and impatience of the horses; and upon this singular edifice the main strength of the army passed in seven days and nights, from the Asiatic city of Abydos, to that of Selctes in Europe. The army began its march divided into three bodies, one of which followed the sea shore, and the two others proceeded at Baxed distances, through the interior part of the country. (See Herodotus, i. vii.) The measures that had been adopted, procured them certain means of subsistence. Three thousand vessels laden with provisions kept along the coast, regulating their motions by thofe of the army. The Egyptians and Phœnicians had previously flourished many of the maritime towns of Thrace and Macedonja, and the Persians at every station were fed and provided with every thing by the inhabitants of the adjacent countries, who, long apprised of their arrival, were prepared for their reception. But before this general transporta- tion, a considerable part of the forces had been already sent to
the coast of Macedonia, in order to dig across the Ilissus which joins to that coast the high promontory of Athos. The difficulties which beset the fleet commanded by Mardonius, in doubling the cape of this celebrated peninsula, was full

pretext to the mind of Xerxes. The neck of land, only a mile and a half in breadth, was adorned by the Grecian city of Samos; and the promontory being rich and fertile, was

well inhabited both by Greeks and Barbarians. The cutting of this narrow Ilissus, by a canal of sufficient width to allow two galleys to sail abreast, was a matter not beyond the power of a potentate who commanded the labour of so many myrmidons; but it is observed by Herodotus, to have been not more laborious than utility, as the vehemences, according to the custom of the age, might have been conveyed over land with greater expedition, and with less trouble and expense. The Persians forces were now

safely conducted into Europe; and the chief obstacle to the easy navigation of their fleet along the coasts of Thrace, Macedonia, and Thessaly, to the centre of the Grecian states, was removed by the dividing of mount Athos. Through the fertile plains of Lepper Asia, the whole army had kept in a body; but the difficulty of supplying obliged them to separate into three divisions in their march through the six

cultivated countries of Europe. Before this separation took place, the whole Persian army were encamped by Xerxes, near Doricus, a city of Thrace, at the mouth of the river Habros. This celebrated muster we shall narrate in the words of Dr. Gillies. "Such an immense collection of men assembled in arms, and attended with every circumstance of martial magnificence, gave an opportunity for seeing, or at least for supposing, many interesting scenes. The ambition of the great king had torn him from his palace of Susa, but it could not tear him from the objects of his affection, and the minions of his pleasure. He was followed by his women, and by his flatterers, and all the effeminate pride of a court was blended with the pomp of war. While the great body of the army lay every night in the open air, Xerxes and his attendants were provided with magnificent tents. The splendor of his chariots, the splendor of his horses, which far excelled the swiftest racers of Thessaly, the unexampled number of his troops, and above all, the bravery of the immortal band (a body of 10,000 Persian cavalry, so named because their number was constantly maintained from the flower of the whole army), seemed sufficient, to the admiring crowd, to raise the glory of their sovereign above the condition of humanity; especially since, among so many thousands of men as passed in review, none could be compared to Xerxes in strength, in beauty, or in stature. But amid his splendor of external greatness, Xerxes felt himself unhappy. Having attended an audience to view his camp and fleet, his pride was humbled with the reflection, that no one of all the innumerable host could survive, an hundred years. The haughty monarch of Asia was melted into tears. The conversion of his kindred and counsellor, Artabanus, was ill calculated to console his melancholy. That respectable old man, whose wisdom had often moderated the youthful ardor of Xerxes, and who had been as affidant to prevent, as Mardonius had been to promote, the Grecian war, took notice that the misery of human life was an object far more lamentable than its shortness. In the narrow space allotted, has not every one of these in our presence, and indeed the whole human race, often wished rather to die than to live? The tumult of passions disturb the heel of our days; diseases and weakness accompany old age; and death, so vainly dreaded, is the sure and hopeless refuge of wrretched mortals." (See Gil-

lies, vol. i. p. 424.) Xerxes often conversed with Dema-

ratus, an exiled king of Sparta, who had taken refuge with the Persians, and their dialogue, detailed by Herodotus, admirably illustrate the opposite circumstances and charac-

ter of the Persians and Greeks. The following is the

substance. "Do you imagine," said the despot, "that the Greeks will submit to my forces?" Dema-
ratus, having obtained permission to speak the truth, replied, "The Greeks are to be feared, because they are poor and virtuous. Without possessing the sublimity of fortune, I shall only speak to you of the Laconians; They will scorn the idea of slavery. Should all Greece submit to your arms, they will be but the more inplicit in defiance of their liberty. I perceive not the number of their troops; were they but a single thousand, you, were they but a thousand, they would perform themselves to the combat." The Persian king, at hearing this, laughed aloud; and after comparing his forces with those of the Laconians: "Do you not see," said he, "that the greatest part of my soldiers would take to flight, they not being received by messengers and blows? As for his dead cannot operate on those Spartans, who are represented to you as free and independent, it is evident that they will never unnecessarily brave certain death; and that what is the ruin of the Persians, will be the salvation of the Greeks. "The law," replied Demaratus, "that law which has more power over them, than you have over your subjects; that law which faith to them, h. hold your enemies; and which is not to number them; you must conquer or die." Xerxes was rather amused than instructed by this discourse. His hopes of success seemed built on too solid principles to be shaken by the opinion of a prejudiced Greek. Every day messengers arrived with the submission of new nations. He proceeded on his march, till he arrived at the pas of Thermopylae. This is a defile situated at the foot of mount Octa, between Thessaly and Phocias; a pass no more than ninety feet broad, and the only one by which the host of Xerxes could penetrate into Achaia. Thither the Grecian army, not exceeding 11,000, directed its course; of these 4,000 only were more immediately defined to defend the pass. But finding himself isolated, and being informed by Demaratus, that a handful of men might at this place stop for a considerable time all his forces, he endeavoured to corrupt Leonidas by magnificent presents, and the most tempting promises, even that of making him supreme lord of Greece. But Leonidas having rejected all his temptations with disdain, Xerxes then ordered him by a messenger to send him his arm. "Let your king come and take them," answered Leonidas. Then the Medes advanced against the Greeks; but being unable to sustain their attack, were obliged to retreat. The troop of Persians, distinguished by the name of immortal, next charged the Greeks, and fought with great valor, so that the palls was soaked up with dead. While the bulk of troops of Xerxes were thus sacrificed to the Spartan valor, an inhabitant of the country having discovered to the Persians a secret path conducting to an eminence that commanded the palls, a large detachment was immediately sent to take possession of it. Leonidas receiving intelligence that the tops of the rocks forming the palls were occupied by 20,000 Persian troops, whose darts must soon overwhelm him and his small party, intimated the greater part of his men to retire, and reserve themselves for a more advantageous opportunity of serving their country; while he himself with about 300 Spartans and a few Thespian would maintain the palls till the last. The rest having accordingly departed, "Come my friends," said Leonidas, "let us die cheerfully, in the hope of supplanting together in the other world." His brave companions, encouraged by the example of their chief, thought
thought of nothing now but to fell their lives as dearly as possible; believing it incumbent on them, as the leading people of Greece, to devote themselves to certain death, thereby to convince the Barbarians how much it must cost them to reduce a free people to slavery. In the dead of night, the heroic troop advancing directly forwards to the tent of the king, penetrated to the middle of the Persian camp, cut off all that came in their way, and spread the most dreadful confusion among the enemy. But daylight hailed their distress to the Persians, they were immediately surrounded, and being rather overhelm'd than conquer'd, locasted their last above hundreds of slaughtered enemies; leaving to after age an example of intrepidity before unknown, and hardly to be paralleled in history.

The Persians are said to have lost upwards of 20,000 men in this engagement, and, among the rest, the two brothers of Xerxes. To the memory of these brave defenders of Greece, a superb monument was afterwards erected, bearing two inscriptions: the one in honour of all those who had served on that occasion; importing, that an army of four thousand Peloponnesian Greeks had there flopped the progress of the whole Persian force; the other in honour of Leonidas and his 300 Spartans, expressed, in a few simple words, to this effect: "Go, passenger, tell at Sparta, that we died here in obedience to her laws." This famous action at Thermopylae, in the opinion of Diodorus Siculus, contributed very highly to the subsequent advantages obtained by the Greeks for the Persians, in striking the instance of desperate valor, thence concluded, that it was hardly possible: to subdue a nation of such undaunted resolution; and the Greeks likewise perceived, from the same example, that valor and discipline are capable of vanquishing the greatest multitude; and that therefore it was possible to overcome the Persians.

But the principal defence of Greece rested with the Athenians. The very day that Leonidas fell at Thermopylae, the Athenian fleet, commanded by Themistocles, having discovered, while cruising off Artemisia, a promontory of Euboea, a detachment of the enemy's fleet amounting to two hundred vessels, attacked them in the night, and sunk more than thirty of them, and the rest were that same night wrecked on the coast of Euboea by a storm that followed the engagement. The Athenians receiving next day a reinforcement of sixty-three ships more, attacked those of the Cilicians, and sunk many of them. A general engagement ensued the same day, in which both parties fought with great bravery; and though neither could boast of the victory, yet the loss was most considerable on the side of the Persians.

From the events of these several actions, the Athenians learned, that victory is not always determined by the greater number of ships. Victory, in the mean time, of what had passed at Thermopylae, the Greeks thought it advisable to retire nearer home, and therefore set sail for Salamis, a small island not far from Attica. Xerxes having now advanced into Phocis, after marking his march all along his land, and reducing to his command, the Peloponnesians resolved to fortify themselves within the island. The Athenians, therefore, seeing themselves on the eve of being crushed under the whole weight of the Persian power, felt in this extremity, to consult the oracle; who told them, "that the only means of preserving their city were wooden walls." These wooden walls, pointed out by the oracle, were interpreted by Themistocles to be their ships; and he told his countrymen, that the sole means of preservation left was, to abandon the city, and to betake themselves to their fleet. This advice was not at all relished by the people; but, thundered at the thoughts of deserting their gods, and the tombs of their ancestors. Themistocles, however, succeeded at last in persuading them, that the existence of Athens depended neither on its houses nor its temples, but on the lives of its citizens; and that the gods themselves had, by the mouth of the oracle, plainly declared it to be their pleasure, that the Athenians ought to leave their city for a while. The people at last, convinced by his eloquence, consented to go on board of their ships. It is difficult to say, whether we are more affected on this occasion by the melancholy situation of the Athenians, thus compelled by a barbarous and unprovoked attack on their native country, or by the heroic resolution of these Athenians, to go in this manner into a fort of involuntary submission, rather than submit to their oppressors. The Athenians conveyed their women, children, and the greater part of their old men, to Trasene, a small town on the sea coast of Peloponnesus, where they were received with all the marks of humanity which their situation required. But many of their oldest men were left in the citadel, being unable, by reason of their great age and infirmities, to undergo the fatigue of transportation. Xerxes in the mean time approaching towards Athens, sent a detachment of his army to plunder the temple of Delphi, which contained immense riches. But Herodotus and Diodorus Siculus tell us, that most of the soldiers sent to execute this order perished in an accidental tempest. The Persian army arriving at Athens, found nothing but silence and solitude within the walls. They attacked the citadel, which, after a brave resistance by its feeble garrison, was taken by storm, and all within it were put to the sword; Xerxes ordered the red of the city to be set on fire. In the mean time the differences were likely to arise in the Greek fleet commanded by Eurybates; one half of them being of opinion that they ought to advance towards the island of Corinth, to be at hand to support their army; and the other, that they ought by no means to quit the advantageous post at Salamis. The latter opinion was supported by Themistocles, who, on this occasion, gave another proof of his extraordinary moderation and coolness of temper. For while he was maintaining his opinion with some warmth against Eurybates, who was a man of choleric disposition, the latter flew to a passion, and lifted up his cane to strike him; Themistocles called out to him, "strike, but hear me." His eloquence and firmness at last prevailed, and the Greeks saw that, being extremely inferior to the enemy in the number as well as in the size of their ships, it was of the highest importance to avail themselves of their present situation, and to give battle in such a narrow strait as that of Salamis, where the enemy could not bring all their fleet into action. They resolved, therefore, to prepare to fight the Persians in this strait. The Persians determined to give battle, contrary to the opinion of queen Artemisia, who represented to them, that the loss of a sea fight must inevitably be attended with the destruction of their army in land. But her advice, though the most prudent, was rejected, Xerxes having himself declared his sentiments for their coming to action. Themistocles, in the mean time, to put it entirely out of the power of his countrymen to retire from Salamis, contrived to have false intelligence conveyed to Xerxes of their intending to decline the engagement, and to make their escape, and therefore advising him to order his fleet instantly to advance and block them up. This stratagem he communicated to Aristas, who undertook to exhort the rest of the commanding officers with whom he was in great credit, not to be dismayed at seeing themselves hemmed in, but to behave with their usual intrepidity. The stratagem had the desired effect; and
A T H E N S.

and the Greeks seeing no other possibility of escaping, except by fighting their way through the midst of the enemy, prepared for the engagement. Xerxes, who was on shore, being deacons of seeing the battle, ordered a superb throne to be erected for him on an eminence. The fleet of the Greeks confided of three hundred and eighty sail. Themistocles, who that day commanded it, waited for the rising of a wind, which regularly began to blow at a certain hour, in a direction exactly in the face of the enemy. The Persians began the attack with great bravery; but the small fleet of the Greeks, acting by the skill of its commanders under every advantage, soon threw the enemy’s first line into confusion, and sunk the Persian admiral. Those that followed him, intimidated by his fate, partly betook themselves to flight, and partly were sunk. On the wings, however, the action continued very warm and obstinate; but the wind being against the Persians, the unwieldy size of their ships rendered them very difficult to be managed, and their great number rather embarrasing than availing them in such a narrow strait, they could not long sustain the impetuosity of the Athenians, but fell into a general disorder. The Ionians, mindful of their Grecian extraction, were the first that fled; and they were quickly followed by the rest of the Persian fleet, which soon appeared scattered up and down in flight and confusion. Queen Artemisia signified herself by a courage far above her sex. In the height of the battle, perceiving herself to be on the point of falling into the hands of the Greeks, she immediately hung out Grecian colours, and attacking one of the Persian galleys, sunk it. The Greek that pursued her, deceived by this stratagem, believed her to be one of his own party, and emptied the punt. The victory cost the Greeks forty ships; but of the Persians two hundred were either taken or sunk. This engagement, one of the most memorable recorded in ancient history, established immortality on the Grecian Wisdom and courage. The renowned Cimon, though yet but a young man, distinguished himself highly on that occasion, and gave evident marks of his future greatness. But as the principal glory belonged to Themistocles, the eyes of all the Greeks were fixed on him, and the highest honours were conferred on the deliverer of Greece. At this time every sentiment of jealousy was overlooked, and none exceeded the Lacedaemonians in their eumonisms on Themistocles, whom they crowned with laurel, the reward of wisdom and valour. When he appeared at the Olympic games, the whole assembly rose up to give him place; every eye was fixed on him alone; and that day was the most glorious of his life.

The Persians and Greeks were in expectation of a new battle; but Mardonius was by no means satisfied with the orders given by Xerxes; he read in the soul of that prince nothing but the meanest sentiments combined with projects of revenge, to which he possibly might fall a victim. “My lord,” said he, approaching him, “desire to recall your courage; your expectations were not founded on your fleet, but on that formidable army with which you have entrusted me. The Greeks are no more able to resist you than heretofore; nothing can shelter them from the punishment due to their ancient offences, and the fruits of advantage they have lately gained. If we determine on a retreat, we shall for ever be the objects of their devotion; and the opprobrium that has fallen on the Thracians, the Egyptians, and other nations who fought on board your vessels, will recoil on your faithful Persians. Suffer me to propose another method to save their glory and your own; I would advise you to lead back the greater part of your troops to Persia, and leave me three hundred thousand men, with whom I shall be able to reduce all Greece.” (See Herodotus, i. viii.) Xerxes, who in his own mind was rejoiced at the proposal, assembled his council, admitted it to Artemisia, and required her opinion on the project of Mardonius. The queen discovering the real sentiments of Xerxes, gave an advice which he knew would be pleasing. “I assure you,” said she, “to Mardonius, the care of completing your work. If he succeeds, yours will be all the glory; if he perishes, or is defeated, your empire will not, on that account, be shaken, nor Persia confide the loss of a battle as any great misfortune, when you have secured your person.” When the Greeks had leisure to examine the extent and completeness of their successes, they determined, in the first emotions of triumph and repentance, to pursue the shattered remains of the enemy. That no Barbarian might escape, they proposed immediately to sail westward, to destroy the Persian bridge over the Hellepolis, and thus to intercept their return. This design was recommended, and chiefly supported by the Athenians, who, having experienced the greatest share of the danger, felt most sensibly the joys of deliverance. But upon more mature deliberation, it occurred that the Persians were full sufficiently numerous to afford just grounds of terror. To their cowardice and inexperience, not to their want of strength, the Greeks owed all their advantages over them; but should the impossibility of retreat be added to their other calamities, they might derive courage from despair, and, by efforts hitherto unexerted, repair the consequences of their past errors and misfortunes. These considerations, first suggested, it is said, by Euribides the Spartan, were adopted by Themistocles, who, convinced his countrymen that the jealousy of the Grecian gods, unwilling that one man should be lord of Europe and Asia, rather than their own provinces, had given them the victory over Xerxes; a prince of such folly and madness, that he had treated with equal irreverence things human and divine, destroyed the sacred temples, overturned the venerable altars and images, and impiously insulted the gods of the Hellepolis with stripes and fetters. That it was the duty of the Athenians, after having gloriously repelled the common enemy, to provide for the subsistence of their wives and families, to few their lands, rebuild their houses, and thus to repair, by the most industrious activity, the dreadful ravages committed on their territories. (See Gillies, vol. i. p. 482.) Themistocles had no sooner persuaded the Athenians to embrace his opinion, than he secretly dispatched his confidant Sicyon to acquaint the great king with the danger which he had so nearly escaped, and to advise him to pursue his journey with all possible expedition. Xerxes readily believed a piece of information, which agreed with the suggestions of his own timidity. The rapidity of his march, confounded with other circumstances above mentioned, in proving fatal to the lives of his followers and the crafty Athenian, who knowing the inflamed affections of the multitude, wished to defer the gratitude of a king, gained the double advantage of dispelling sooner than could otherwise have happened, that destructive cloud of barbarians which hovered over his country, and of convincing their leader that he was in part indebted for his safety to that very man whose counsels, rather than the arms of Greece, had occasioned his affliction and disgrace.

Mardonius (B.C. 479), after wintering in Thebais, took the field, and began his operations by making very advantageous offers to the Athenians, to detach them from their confederacy with the other states; promising not only to rebuild their city, and to give them a vast sum of money, but to set them at the head of all Greece. Aristides, then
archon, answered the messengers of Mardonius, that all the gold in the world was insufficient to corrupt the Athenians, or to induce them to desert the defence of the common liberty of their country; that while the sun continued to light the world, the Athenians would remain the mortal enemies of the Persians, and would revenge, to the utmost of their power, the mischief they had brought upon their country, and the burning of their houses and temples. As soon as Mardonius received the answer of the Athenians, and thence knew that no motive could induce them to break their engagements, he ordered his army to march towards Attica. The Athenians, on the approach of the Persian army, left their city a second time, and retired to Salamis. Mardonius therupon sent new deputies to them, with terms still more advantageous than the former: but the Athenians were so far from accepting them, that they flomed to death one Lycidas, only for saying that they ought to give an audience to the deputies. The Perians, general, provoked at the contempt with which the Athenians treated all his proposals, entered Athens, and burnt everything that had formerly escaped the fury of Xerxes. In this situation, the Athenians complained to the Lacedaemonians of their not having sent them the flippated succours: the latter were then fully intent on maintaining their ground within the Peloponnesus, and defending the entry of the invaders; but in compliance with the requisition of the Athenians, who made a great outcry against the flowers of their proceedings, they sent to their assistance five thousand Spartans, each of whom was attended by seven helots. These forces, joined with those of the Athenians and Peloponnesians, formed altogether an army of about 70,000 men; which, after assembling at Eleusis, followed Mardonius into Boeotia, and encamped at the foot of Mount Citheron. Paufanias, son of Cleonbratous, and vicar of Sparta, commanded the Lacedaemonian troops, and Aristides, a chief of the Athenians; the Persian army then amounted to 400,000 men. Paufanias, in the mean time, advanced towards Plataea, with his forces drawn up in battle array; the Athenians being on the right wing, and opposed to the Persian troops, and the Lacedaemonians on the left, opposed to the Greek troops in the service of the Persians. The Megarans, who were encamped on the plain, having been attacked by the Persian cavalry, were, after a very brave and long resistance, on the point of giving way, when three hundred Athenians ran to their relief. The battle then became more obdurate than before; but Magistus, who commanded the Persian cavalry, being slain, his men took themselves to flight. The death of this officer, who was reckoned the ablest in the Persian army, spread universal confusion through all their troops. Ten days intervened between this action and the general engagement. Artabanus was of opinion, that the Persians ought to avoid a general battle; but Mardonius, a man of a violent fiery disposition, thought otherwise. Paufanias and Aristides, informed of the design of the Persians to attack them, drew up their army in order of battle near to the city of Plataea, which Mardonius perceiving, changed the intended order of his attack. But the Greeks, finding themselves threatened for water in their present situation, resolved to decamp. Mardonius believing this movement to be a flight, immediately advanced with his men, uttering loud shouts, and charged the rear of the Greek army, composed of the Lacedaemonians, who, forming themselves into a column, opposed the enemy with their usual valour, and falling on the Persians with the greatest fury, made a dreadful slaughter. Mardonius fell in the beginning of the action. The main body of the Greek army advancing in the mean time to the charge, in separate detachments, completed the overthrow of the Persians. In another quarter of the field, the 40,000 Greeks in the Persian service, who were engaged with the troops commanded by Aristides, hearing of the flight of the Barbarians, followed their example, and retreated likewise, but rallied in their camp, and there entrenched themselves. The Lacedaemonians, however, supported by the Athenians, attacked and forced their retreatments; after which, nothing was to be seen but a general massacre, for the Persians being too numerous to be made prisoners, received no quarter, and were all put to the sword. Artabanus, after distinguishing himself both as a skilful and as a brave leader, collected the scattered remnants of the Persian army, amounting now to no more than 44,000 men, and returned with all possible expedition towards Persia. The loss of the Greeks in this engagement was about 10,000 men. The Greeks, as a monument of this memorable victory, erected a statue to Jupiter in the temple of Olympia, inscribed with the names of all the states of Greece who had fought at Plataea. It came next under consideration, whether the prize of valour ought to be adjudged to the Athenians or to the Lacedaemonians. But to avoid all controversy on this head, whereby the general joy arising from the victory might be disturbed, the question was, by the influence of Aristides, referred to the determination of the other Greeks, who, to prevent any jealousy between those rival states, adjudged it to belong to the Plataeans. Then, after sending a tripod of solid gold to the temple at Delphos, and letting apart a tenth of the spoil, as an offering to the gods, to be applied to religious purposes, they divided with great justice the rest of the spoil, which was so immense, that Julian is of opinion it was the first great cause of the corruption of the Greek manners. By the persuasion of Aristides, the Greeks passed a solemn decree, obliging all the states to send deputies to Plataea, to offer sacrifice to Jupiter the deliverer, instituting public games at that place every fifth year; and ordering a fleet of a hundred ships, and an army of 10,000 foot, and as many horse, to be kept always on foot, for making continual war on the Barbarians. The Plataeans were appointed to celebrate the anniversary of all those who had fallen in this battle, which they regularly performed with much pomp and ceremony. The Persian fleet, having, in the mean time, failed towards Samos, that of the Greeks, under the command of Leotychides the Lacedaemonian, and Xantippus the Athenian, advanced as far as Delos, upon the earnest intreaty of the inhabitants of Chios, who begged to be delivered from their subjection to the Barbarians; and likewise in consequnce of secret intelligence received by them of the intention of the Ionians to revolt. The Persians, hearing of the approach of the Greeks, retired to Mycale in Asia Minor, where they drew their vessels on shore, and surrounded them with a deep ditch. The Greeks, however, purged them thither, and with the affilience of the Ionians, attacked them. The battle was at first bravely fought on both sides; but the Milesians and Samians, followed by the rest of the Asiatic Greeks, having deserted from the Persians, the latter were vanquished, and 40,000 of them cut in pieces. The Athenians took possession of the enemy's camp, burnt the Persian fleet, and returned to Samos with a vast deal of plunder. This engagement happened on the same day with that of Plataea. Thus did that memorable day for ever free the Greeks from any future Persian invasions, and deliver them from those innumerable armies of Barbarians, which like clouds of locusts had confounded their country for two whole years. These grievous defeats were never forgotten by the Persian monarchs; and
they entirely erred Xerxes of all desire of undertaking any other enterprises of the same kind. He thought no more of executing vengeance on the Greeks; and to efface all remembrance of his past disasters, he gave himself wholly up to every sort of voluptuary and debauchery. His court became one general scene of the most flamboyant excellence, murder and incest succeeding each other in a perpetual round. This week heathenism, the next to death by his own furies. The severe effects of tyranny, formerly experienced by the Athenians, had excited in them such a strong desire of liberty, that to preserve it, they boldly hazarded the greatest dangers. Their bravery, however, was admirably supported and conducted by the wisdom and skill of their generals, who were particularly attentive to choose such a situation for giving battle, that the enemy could not much avail themselves of their vast superiority in point of number.

Thus by their vigorous efforts, and the wisdom of their leaders, delivered from the Persian invasion, the Athenians brought back their wives and children to Athens, of which they rebuilt the walls, and considerably increased the extent. The Lacedaemonians taking Nabirage at their own expense, from an apparatus which Athens should have been too powerful, rededicated to the Athenians, that it was the general interest of Greece to have no fortified place without the Peloponnesus, because in case of a fresh invasion, it might serve for a retreat and warlike magazine to the enemy. Themistocles having procured himself to be named ambassador to Lacedaemon, there to justify the conduct of his countrymen, maintained in open senate that it was as much for the common advantage of the allies, as for that of the Athenians, that the latter had fortified their city with good walls; that besides, it was but equitable that they, as well as the rest, should take proper measures for their own safety; and in fine, that they were able to defend themselves either against foreign or domestic enemies. In the next place, Themistocles, solely intent on increasing the power of the republic, fortified Piraeus (B.C. 477) the famous harbour of Athens, in the same manner as he had done the city, and persuaded the Athenians to augment their fleet yearly with twenty ships. The object of this skilful politician was to deprive the Lacedaemonians of the superiority hitherto possessed by them over the other states of Greece. But it must be confessed that he was not very ferupulous with regard to the means employed by him for that purpose. An instance of this was his project of burning the Grecian fleet in the harbour of Sigeum; whether it had retired to winter after the defeat of Mardonius; or, according to some authors, that part of it only which belonged to the Lacedaemonians. But not daring openly to propound this scheme, he was defined by the people to communicate the matter privately to Aristides, who having been accordingly informed of it, declared to the people, that though the project of Themistocles was indeed highly useful, yet at the same time, it was most unjust! Themistocles was therefore prohibited from putting it in execution.—How becoming thus to fec a whole state prefer what was just to what was useful! and what a high idea of the justice of Aristides must we not conceive, when we see him chosen singly by a whole people, to determine whether a project of the utmost general importance was just or unjust! At the same time, the allies prepared to relieve to their freedom the Grecian cities in which the Persians had left garrisons. A numerous fleet, under the command of Panathenae and Aristides, obliged the enemy to abandon the ist of Cyprus; and the city Byzantium, situated on the Hellespont. The conduct of Panathenae on this expedition was so infolent, as to disturb the allies, who refused any longer to obey the Spartans, and henceforward to fight under the orders of the Athenians. (B.C. 476.) The farther proceedings of the Lacedaemonian general, and his fate, will be found under the article PAUSANIAS, and SPARTA. The Spartans, with a praiseworthy moderation, yielded to the Athenians the command of the sea. About this time, Themistocles exalted the victor of thermometer, and the posture of popular favour. The civil administration of this illustrious Athenian was no less eminent and successful than his political and military efforts. By yielding more protection to strangers than they enjoyed in neighbouring cities, he augmented not only the population, but the wealth of Athens, as that description of men paid an annual contribution in return for their security. This, together with other branches of the revenue, he employed in building annually about sixty galleys, the addition of which to the Athenian navy abundantly compensated such losses as were sustained by the accidents of the sea in foreign parts. Notwithstanding the envy and malevolence of worthless demagogues, who.infuriated the Athenian assembly and courts of justice, Themistocles was full as free from the stain of the same authority at home which Aristides enjoyed abroad, when complaints arrived from Sparta, that he had conspired with Panathenae to betray the public liberty. The known resentment of the Spartans against this extraordinary man sufficiently explains the reason why they, who were so dilator, in their proceedings against Panathenae himself, should be so eager to bring to punishment his supposes accomplice. But it is not easy to conceive how the Athenians could admit such an accusation against a citizen, whose singular valor and conduct had gained the decisive victory at Salamis; whose counsels and addresses had fortified their city with impregnable strength; whose foresight and activity had procured them a fleet which no nation in the world could rival; and whose abilities and patriotism had not only saved his country from the most formidable invasion recorded in history, and which was principally directed against Athens, but amidst the terrors of this invasion, the treachery of false friends, and the violence of open enemies, had so eminently contributed to raise his republic to the full rank in the Grecian confederacy. Yet such, on the one hand, was the effect of that envy which in republics always accompanies excellence; and, on the other, the influence of Spartan hospitality and intrigues, that Themistocles was banished by the oracles, a punishment inflicted on men whose aspiring ambition seemed dangerous to freedom, which required not the proof of any particular delinquency, and which had effect only during a term of years. Gillies, vol. ii. p. 65. This ill-fated man retired into Persia, where his treatment and death will be seen under the article THEMISTOCLES. Aristides also died about the same time, B.C. 467 or 471, and the conduct of the Persian war was devolved on his colleague Cimon, who united the integrity of that great man to the valour of Miltiades his father, and the decisive boldness of Themistocles. But as he felt an ambition for eminence which disdains bare imitation, he not only reflected the most distinguished excellencies of his predecessors, but improved and adorned them by an elegant liberality of manners, an indulgent humanity, and candid condescension; virtues which so enrolled him the affections of his fellow citizens; while his military talents and authority, always directed by moderation and justice, maintained an absolute sway over the allies of the republic. His first operations were employed against the coast of Thrace, which the taking of Byzantium seemed to render an easy conquest. The only places in that country fitted to make an obstinate resistance, were
the towns of Eion and Amphipolis; both states on the river
Streama; the former near its junction with the Strymonic
gulf, the latter more remote from the shore, but entirely
furnished by the river which formed the principal
branch of that copious stream. Amphipolis, however, was
then inhabited by a numerous colony of Athenians.
But Eion still opposed a vigorous resistance; Bogyes, the
Perian governor, having determined rather to perish than
surrender. After long ballying the efforts of the besiegers,
by such perfervent courage and activity as none of his
countrymen had displayed in the course of the war, this
fierce barbarian was at length not tamed but exasperated
by hunger. His companions and attendants, equally degenerate
with their master, followed his example, and manufac-
turing the ramparts with one accord, threw into the middle
stream of the Strymon their gold, silver, and other precious
effects. After thus attesting their implacable hatred to the
afflicted, they calmly descended, lit a funeral pile,
butchered their wives and children, and again mounting the
walls, precipitated themselves with fury into the thickets
of the flames. After this, Cimon subdued the other cities
in that country, drove from Syros the pirates that infested
the Aegean sea, established an Athenian colony in their
place, and made himself master of Naxos. Crossing along
the coast of Asia, he reduced all the marine cities of
Caria and Lycia, and left not the Persians in possession of
a single inch of ground between Ionia and Pamphylia.
Hearing that the Persian fleet lay at anchor at the mouth of
the Eurymedon, waiting for a reinforcement of Phoenician
ships, that they might attack him with their united forces;
he immediately sailed against the former to prevent their
juncture; charged them with such vigour, that they were
obliged, in spite of their great superiority, to run their
ships aground; and took more than a hundred of them.
Without giving his men time to breathe after their victory,
he instantly landed them, and attacked the army of the
enemy, which was drawn up on the banks of the Euryme-
don. The Persians sustained the first charge of the Greeks
with great firmness. But the troops of Cimon, animated
by their late successes, broke them at last, put them fairly
to flight, made a great number of them prisoners, and got a
captive booty. Cimon crowned his victories with the capture
of the Eurymedon, which was the chief advantage
of the Persians, and by that means gave a fatal blow to
the Persian naval power. The rich spoil of the Barbarian camp
rewarded the enterprise and celerity of the Greeks, who,
loaded with wealth and glory, returned home during winter,
and piously dedicated to Apollo a tenth of the plunder
acquired by these ever memorable achievements. A con-
 siderable portion of the remainder was employed in
 strengthens the fortifications of Athens. Agreeably
to the Grecian custom, the general was entitled to a
valuable share. Cimon received it as a testimony of the
public esteem, and expended it for the public use, embellish-
ing his beloved native city with shady walks, gardens, porti-
ces, schools of exercise, and other works of general plea-
sure and utility. (See Gilles, vol. ii. p. 74.)

While Cimon was attending the power, glory, and influence
of the Athenians abroad, many of his quick talents acquired
the direction of affairs at home. This was Pericles, one of the
most extraordinary men that ever Athens herself produced.
His mind, naturally of the first capacity and vigour, was
enriched by extensive and useful knowledge, adorned by
elegant literature, and fortified by the profoundest
philosophy. Diarmed, proficiently a teacher of rhetoric, but really master
of history, politics, and all the learning of the times, was his
regular teacher. Aeschylus instructed him in philosophy. That
wife man had made it his chief study to confirm the most
important and pleasing doctrine, that being of supreme
intelligence and benevolence governs the world;eward the
victorious, and punishes the vicious. "From him (says Dr. Gil-
lices) Pericles early learned to control the temper of youth-
ful passions, which so often blash the promising hopes of
youthful manhood; to preserve an unshaken constancy in all
the vicissitudes of fortune, since all are the varied dispensa-
tions of the same wise Providence." Pericles: in means for
the attainment of his objects; skilful in the varied applica-
tion of them, according to the variation of circumstances;
having the ready and compleat command of his own great
intellect and extensive information, both in forming and
executing plans; courageous, temperate, veracious, yet heed-
dful, decisive, yet cautious; bold, yet prudent; enterprising, yet
circuitous; he excelled in politics, in war, and in every
pursuit which required combined genius and conduct. His
eloquence united plentitude of information, force of genius,
and nervousness of style; it was either convincing or per-
suasive, according to the objects he had in view; at one
time, its majesty commanded the hearers; at another, its
sustains and delicacy infused itself into their hearts.
The superior talents of this celebrated statesman greatly
increased the prosperity of the country, and his policy was
peculiarly beneficial in improving the advantages that had been
acquired in war by his predecessors, or his contemporaries
Cimon. He promoted agriculture and manufactures,
and greatly extended the commerce and maritime power of
his country. Richest flowed from all quarters to Athens,
and were in a considerable degree employed in strengthening
and adorning the city. He encouraged the fine arts, litera-
ture, and philosophy. Under him flourished Polygnatus,
Phidias, and Phidias, the ingenious artists, who happily
made painting, sculpture, and literature, the vehicles of sen-
timent and character, as well as of external feature and
figure. Respected by him, lived Anaxagoras, the father of
moral philosophy; and Euripides, who, in the garb of
fiction, exhibits the just and elevated reasoning, the pious
and virtuous sentiments of both. Taste, genius, and phil-
osophy were never more prevalent than at Athens in the
age of Pericles. But with the many advantages which
were conferred upon the Athenians by Pericles, there were
also many disadvantages, but rather in ultimate effect
than in immediate appearance. There were two parts of
Athens, the aristocratical and democratical. Cimon
by blood and affinity was connected with the former, and by
his dispositions and character was fitter for gaining an ascen-
dancy over the chief people in the state, than for courting
the multitude. With all the powers and accomplishments
which could form a patriotic and beneficial statesman and
federal, he wanted the dexterous versatility which conciliates
the favour of the multitude. Pericles, with genius and
strength of mind that must have rendered him a leader in any
class of men, in any age or country, chose popularity as the
road to the gratification of ambition, and indulged the in-
clination of the populace, as well as perfused the interest of
the state. With this view he promoted luxury, licentious-
ness, and profusion. The firm and rigid virtue of Cimon
was adverse to such a pernicious waste of the treasures
which his exertions had acquired. Between two such great
men, embracing opposite principles and parties, rivalry
naturally arose. Foreign politics, as well as domestic, clained their
differences. Cimon, aristocratical in his own principles,
was attached to the Spartans, and wished anarchy to subsist
between Sparta and Athens. The Athenian multitude,
clated with their signal successes, and wishing to dominate
over all Greece, was hostile to Sparta, which would be the
molt
most powerful obstacle to the accomplishment of their designs. The Spartans, on the other hand, were extremely jealous of the progress of the Athenians, and of the formidable power they had acquired. Cimon endeavoured to appease Pericles' promotion, this hostile spirit between the two chief nations of Greece; and his schemes appeared to be the more successful. But their animosity, before it broke out into action, was diverted by a calamity equally sudden and unforeseen. In the year four hundred and sixty-nine before Christ, Sparta was overwhelmed by an earthquake. The Greeks and the neighbouring mountains were shaken to the foundation, and twenty thousand Lacedaemonian citizens or subjects perished in this dreadful disaster. Amidst the ruins of Sparta, one description of men beheld the public misfortunes not only without horror, but with a forced satisfaction. The approved Spartan slaves, known by the appellations of Helots and Melephans, assembled in crowds from the village in which they were cantoned, and took measures for delivering themselves, during the cruelty of the elements, from the not less inexcusable cruelty of their ruling tyrants. The prudent arrangements of king Archidamus, who, foreseeing the revolt, had summoned the citizens to arms, prevented them from getting immediate possession of the capital; but they rendered themselves masters of the ancient and strong fortresses of Ithome, from which they continued many years to infest the Lacedaemonian territorics. Cimon earnestly seconded the application of the Spartans, and the Athenians were prevailed on to lend them the required assistance, and the combined forces proceeded to the siege of the fortresses. The besiegers, however, met with solitary successes, that the Spartans dismisified their Athenian auxiliaries, on pretence indeed that their help was no longer necessary, but in reality, from a suspicion that they favoured the interest of the rebels. The Athenians were greatly offended by this caprice, and Pericles instructed his partisan Ephialtes to remind the people that Cimon was the chief promoter of rendering assistance to the Spartans. The ill-fated captain was assassinated, and a farther charge laid against him that by pretexts from the Macedonians he was prevailed upon to let slip a manifest opportunity of enlarging his conquests, after taking from the Persians the gold mines of Thrace. To this accusation Cimon replied, that to the utmost of his power he had protracted the war against the Thracians, and other enemies of the state of Athens; but that it was true he had not made any inroads in Macedonia, because he did not imagine that he was to act as a public enemy to mankind, and because he was struck with respect for a nation modelled in their carriage, just in their dealings, and strictly honourable in their behaviour towards him and the Athenians; that if his countrymen looked upon this as a crime, he must abide their judgment; but, for his part, he could never be brought to think such conduct amiss. His defence however was unavailing, and he was banished for ten years. (B.C. 460.)

Pericles, thus free from the control of Cimon, confirmed his own credit with the people, and made innovations on the established form of government. He deprived the Areopagus of the power of judging in the most important questions that had formerly belonged to their jurisdiction; he rendered the other courts of justice subservient to his pleasure; and he became so absolute in Athens, that under this republican government he possessed a power almost despotic. To secure the permanency of his power, while he promoted industry and beneficial action, he gratified their love of pleasure. The city now to use the language of Dr. Gillesp] afforded a perpetual scene of triumph and festivity. Dramatic entertainments, to which they were passionately ad-
the course of the river, rendered the ground round the ships dry, took every one of them, and put the greatest part of their crew to the sword. The army being thus disabled from opposing the enemy any longer, partly perished and partly dispersed. During these circumstances the Athenians became sensible of the injustice of their treatment of Cimon, and recalled him after five years banishment. Soon after his return, that great man succeeded in bringing about a peace between his countrymen and the Lacedaemonians (B.C. 455); and with a view of diverting the Athenians, grown prepossessing by their late good fortune, from making war on their neighbours, he resolved to find occupation for their arms abroad. Departing, therefore, for Cyprus with a fleet of a hundred and forty vessels under his command, and being there joined by sixty more from Egypt, he attacked Artabazus, the admiral of Artaxerxes, and took a hundred of his ships: he next made a descent upon Cilicia, and totally defeated Megabazus, another officer of that price; he then returned to Cyprus to form the siege of Citium. In the course of the siege, Cimon fell sick: perceiving his end approaching, he beseeched his men to keep his death a secret. They followed his advice, and, proceeding with their operations, obtained a signal victory, in which they took a hundred of the enemy's ships, and then sailed back in triumph to Attica. Artaxerxes, finding his inability to contend with the Athenians, sent deputies to Athens to solicit peace. His ambassadors were favourably heard in the Athenian assembly by those who were more solicitous about confirming their usurpations over their allies and colonies, than ambitious of extending their Asiatic conquests. Cimon, who invariably maintained the contrary opinion, was now no more. A peace, therefore, was concluded on the following conditions: that all the Greek colonies in Lower Asia should be declared independent of the Persian empire; that the armies of the great king should not approach within three days journey of the western coast; and that no Persian vessel should appear between the Cyanean rocks and the Chelidonian isles; that is, in the wide extent of the Aegean and Mediterranean seas, between the northern extremity of the Thracian Bosphorus and the southern promontory of Lybia. On such terms the Athenians and their allies stipulated to withdraw their armament from Cyprus, and to obtain therefromforward from molesting the territories of the king of Persia. Such was the conclusion of this memorable war, which, since the burning of Sardis, the last decisive act of hostility, had been carried on with little interruption during fifty-one years. The fame magnanimous republic which first ventured to oppose the pretensions of Persia, dictated to that haughty empire the most humiliating conditions of peace; an important and illustrious era in Greek history, which was often celebrated with pompous panegyric during the declining ages of Athenian glory.

Having terminated the war against the Asiatic foe with such honour and advantage, the Athenians directed more confiant and undivided efforts to render themselves paramount in Greece; and, during twenty years, various contents arose between the Athenians and neighbouring states. Without pursuing the detail of these contentions, and the various truces by which they received a temporary suspension, we shall merely mention the result, which was extremely favourable to Athens, so that the republic rose to unprecedented power. With her prosperity the pride of Athens rose in proportion, until her neighbours, both apprehensive and envious of her power, and further inflamed to resentment by her insolence, formed for her humiliation a confederacy which brought on the Peloponnesian war.
in an application so very agreeable to the dispositions of those whose co-operation they desired, and a general confederacy was formed, confining of the seven republics of the Peloponnesus (B. C. 431), except Argos and Achæa; the first of which from ambition, and the second perhaps from moderation, preferred, in the beginning of the war, a suspicious neutrality. Of the nine northern republics, Acræania alone declined joining the allies, its coast being particularly exposed to the ravages of the Corcyrian fleets. The cities of Naupactus and Platea, for reasons that will soon appear, were totally devoted to their Athenian protectors; whose cause was likewise embraced by several petty princes of Thessaly. But all the other states beyond the Íthmus longed to follow the standard of Sparta, and to humble the aspiring ambition of their too powerful neighbour. While they were preparing for this concert, the Peloponnesians sent hostile embassies and manifestations to the Athenians, requiring them to grant independence to the colonies, and announcing the force by which the requisition would be supported. Abjured by this menacing combination, the Athenian populace were filled with rage against Pericles, whom they accused of having cauèed this confederacy by his general conduct, and especially by a decree which he procured against the inhabitants of Megara, which had revolted from the authority of Athens, and imputed his enmity to that city to the private pique of his favourite mistress Alcæa; and with the petty fulmination of a vulgar mob, conceived him to have appropriated to his own life great portions of the national treasure. Though the transcendent virtues of Pericles were not unvalued, yet his were not the vices of common minds; avarice made no part of his composition: he proved that his private expenses were justly proportioned to the measure of his patrimony; many instances were brought of his generous contempt of wealth in the service of his country; and it appeared, after the strictest examination, that his fortune had not increased since he was entrustèd with the exchequer. He contended that the situation of the republic did not justify defen- dence or submission to the dictates of an impious rival. Their financial resources, military and political strength, and above all the spirit of the people, enabled them to resist with effect the efforts of their banded enemies, and by a de- tail of the components of the Athenian strength cons- trasted with those of their rivals, illustrated his proposition. He therefore proposed that the answer to their demands should disclaim their right to interfere, disfavor every inten- tion of commencing hostilities, but declare the readiness and ability of the Athenian republic to repel force by force. Such an answer, in the relative disposition of the parties, was deemed tantamount to a declaration of war. The war which now ensued, is celebrated in Grecian his- tory by the name of the Peloponnesian war. It lasted for twenty-seven years; twenty-one of which are the subject of the history of Thucydides; but death having prevented that illustrious author from purifying it to its termination, its continuation and conclusion was reserved for Xenophon. Hostilities were begun by the Thæans, who attacked Platea, a city of Bœotia, in alliance, as we have just mentioned, with Athens. All Grecia was immediately in motion. The Lacedæmonians march toward the Íthmus of Corinth, a narrow neck of land about six miles broad, which joins the Peloponnesus to the country pro- perly called Grecia. Archidamus, one of the Spartan kings, before advancing farther, dispatches an ambassador to the Athenians, to require of them to relinquish their pretensions. But the Athenians command the messenger to retire, without deigning even to give him an audience. The Lacedæmonians thereupon advanced with an army of 60,000 men, while that of the Athenians amounted to no more than 18,000; but, to make up the odds, the latter had a fleet of 300 galleys. On the approach of the Lacedæmonian army, the inhabitants of the country abandoned their habitations, and carrying away every thing they could, took refuge in Athens. The plan of operations pursued by the Athenians, on the suggestion of Pericles, was to wear out the enemy by protracting the war. The Lacedæmonians entering Attica, had liege to Enoe, but being obliged, after a few fruitless assaults, to relinquish that at- tempt, they advanced still nearer to Athens, and encamped within half a league of the city. Unwilling, while so few in point of numbers, to hazard the fate of the public in a general battle, Pericles found it difficult to pre- vent the Athenians, exasperated at the sight of the ravages committed on their country, from falling forth upon the enemy. But by means of his admirable art in managing the multitude, he kept both the senate and the people from assembling to deliberate, though at the expense of number's insulfs from his enemies; in spite of which he perished in his plan, unmoved either by threats or entreaties. In the mean time he dispatched a fleet of one hundred ships to ravage the coasts of the Peloponnesus; which being joined by that of the allies, made a descent upon Laconia, and laid waste the territories of Sparta. The Lacedæmonians find- ing all their endeavours to draw the Athenians out of their city ineffectual, and receiving intelligence of the ravages committed in Laconia by the Athenian fleet, found them- selves under the necessity of withdrawing from Attica. On the setting out of the expedition against the coast of Laconia, an extraordinary eclipse of the sun happened just as Pericles was going on board of his galley. Pericles perceiving the Athenians to be terrified at this phenomenon, which they considered as an unlucky presage, threw his cloak over the face of the pilot, and asked him if he saw the pilot having answered in the negative, Pericles explained to the by-standers, that the body of the moon, being in like manner interposed at that instant between their flight and the sun, prevented them from seeing his light. When the Lacedæmonians retired out of Attica, the Athenians appropriated a hundred talents of money, and a hundred of their finest ships, for the more immediate recovery of their city, in case of a fresh invasion, prohibiting any perforn, under pain of death, from proposing a different application of those resources. They then expelled from the island of Egina its present inhabitants, whom they regarded as the principal cause of the war; and they divided that island by lot among the citizens of Athens. They made an alliance with the kings of Macedon and Thrace; subdued the island of Cephalonia; laid waste the territory of Megara; and took the harbour of Nisus; this concluded the first campaign. The Athenians next celebrated funeral rites to the memory of those who had fallen since the beginning of the war. For this purpose, a large tent was constructed, wherein they exposed the bones of the slain, which were covered with flowers and perfumes. Then the bones were carried with much pomp and solemnity to a suburb of the city called Ceramics, where they were de- poited in a monument designed to be the tomb of those who fell in war, and half, one of the citizens pronounced a funeral oration in their praise; a charge which on this occasion was undertaken by Pericles himself. Though always superlatively eloquent, he at this time seemed to out- do himself; and in pronouncing the eulogium on those who were no more, he omitted no argument that might inflame the courage of the survivors. Thucydides has preferred this
this famous oration, of which the beautiful expressions and lofty sentiments are equally admired. The army of the Laconian confederates and their allies returned into Attica, and laid every thing waste with fire and sword. But the plague, which then raged among the Athenians, was full more pernicious to them, depriving them of their best citizens and bravest valiant; and Athens exhibited nothing but a melancholy scene of sickness and death. Of this dreadful scourge, an awfully striking account is exhibited in the energetic description of Thucydides. Without dwelling on the corruped symptoms which the historian presents in his affecting narrative of this scourge, we shall merely give the fulness of its moral effects. At the beginning of this dreadful calamity, fable examples of filial piety and generous friendship were displayed; but as the consequences were almost always fatal to the children and friends, they were but rarely repeated afterwards. Then the most respectable ties were broken; the eyes about to close for ever, beheld on all sides only the most profound solitude, and death no longer produced a tear. This callous insensibility gave birth to an unbridled licentiousness. The death of so many worthy men, mingled without distinction in the common tombs with villains; the destruction of such fortunes, became suddenly the inheritance or prey of the lowest citizens, made a lively impression on those who have no other principle but fear. Perfuncted that the god: no longer protected or regarded virtue, and that the vengeance of the laws would not be so prompt as the death impending over them, they imagined that the inability of human philosophers pointed out the use that they should make of them, and that having but a few moments to live, they were justified at least in praising them in the midst of pleasures.

Notwithstanding the difficulties in which Athens was involved, the elevated soul of Pericles, with unbroken fortitude, planned the extinction of his country, as far as it was practicable by human means. A numerous family fell susceptible to the ravenous pestilence. Though a tenderly affectionate father, he bore the disasters with magnanimity. At the funeral of the last of his sons, he dropped, naked, a few reluctant tears of paternal tenderness; but ashamed of this momentous weakness, he bent his invincible mind to the defence of the republic. Having collected an hundred Athenian, together with fifty Chian and Lesbian vessels, he sailed through the Saronic gulf, and ravaged the unprotected coasts of Ely, Argos, and Laconia. The plague breaking out in the fleet, defeated the success of the expedition, and reviving Athens with redoubled fury, almost defoliated the city. Maddened by their accumulated sufferings, the Athenians imputed their miserable situation to Pericles: they deprived him of his authority, and condemned him to a fine; but they soon acknowledged their folly and injustice. He was again prevailed on to resume the reins of administration, and his laudable efforts were employed to stimulate his country to that vigour of counsels and of conduct which only could preserve her power, honour, and independence: temporary disasters might afford, but in the nature of things its duration could not be long; Athens would ultimately triumph, if she was true to herself. "Of the two elements," he said, "detained for the use of men, the sea and the land, we absolutely command the one, nor is there any kingdom, or republic, or confederacy, that pretends to dispute our dominion. Let this consideration elevate our hopes, and personal affiliations will disappear at the view of public prosperity. Let us bear, with resignation, the strokes of Providence, and we shall repel with vigour the assaults of our enemies. It is the hereditary and glorious distinction of our republic, never to yield to adversity. We have defied danger, expanded treasure and blood, and amidst obdurate and formidable wars, augmented the power, and extended the fame of a city, unrivalled in wealth, population, and splendor, and governed by laws and institutions worthy of its magnificence and renown. If Athens must perish, (as what human greatness is not subject to decay?) let her never fall at least through our folly and iniquity; a fall that would cancel the merit of our former virtues, and destroy at once that edifice of glory which has been the work of ages to rear. When our walls and harbours are no more, when the terror of our may shall have ceased, and our external magnificence shall have fallen to decay, the glory of Athens shall remain. This is the prize I have hitherto exalted, and still exhort you to defend, regardless of the clamours of death, the inscriptions of cowardice, or the perdition of envy." These were the last efforts of this illustrious man; he was soon after seized with the plague, which proved fatal. On his deathbed, retaining his understanding, his chief comfort was, not the splendor of his genius and achievements, but the recollection of his well-spent life. When he was about to yield his last breath, the beloved mother of Athens attended round his bed, and soothing their affliction by recounting his victories and the number of his trophies. "These actions," said he to them, raising himself up with difficulty, "are the works of fortune, and common to myself with other generals; the only eulogium I merit is, that I have never been the cause that any citizen should wear mourning." (Gilles.)

After the death of Pericles, two persons contended for the direction of affairs: Cleon, a turbulent and impudent demagogue, devoid of talents, or of any moral qualities which entitled him to pre-eminence, but a great favourite with the lower populace; and Nicias, a man of solid ability, prudence, and integrity; and for several years the war was successful or unfruitful according as the one or the other predominated. About this time the Peloponnnesians invested Plataea, a city in alliance with Athens. This siege is not only remarkable for the obdurate resistance of the besieged, but for being the first recorded in history which was conducted with any sort of regularity. Both parties here made use of mounds of earth, the one to attack, the other to defend. The Peloponnnesians burnt a part of the town by means of bundles of flax, to which they set fire. On the other hand, the besieged neglected no expedition to frustrate the various attempts of the enemy. But the most surprising circumstance of all is, that so small a place as Plataea, which contained no more than four hundred inhabitants, and eighty Athenians, was capable of making so vigorous a resistance against a powerful army. The enemy at last changed the siege into a blockade, and surrounded the town with two ditches. The Barotics were left to guard these intrenchments, and the bulk of the army marched away. The besieged having left all hope of release, resolved to attempt to make their escape out of the town; which about one half of them effected by a very daring stratagem, suggested and executed by defpair. The remaining half, dismayed at the dangers attending the attempt, continued in the town. But finding themselves unable to defend it any longer, they were obliged to surrender at discretion; eight Spartans went to decide their fate; the miserable Plataeans plumed in vain that they had been forced, through necessity, to side with the Athenians, in order to obtain their protection against the Thebans, by whom they were grievously oppressed. They were all murdered in cold blood; their wives were carried into slavery; and their town was razed to the ground. Such was the melancholy fate of the Pla-
ATHENS.

1253. who, during the Persian war, had rendered the most
signal services to Greece.

(B.C. 428.) In the fourth year of the war, the Pelo-
poneans, agreeably to their general plan, invaded Attica
by land, whilst the Athenians as before sent a naval force
to desolate the coasts of their enemies. Between two
parties, of which the one was evidently superior by land,
and the other by sea, if both skillfully employed their
resources, there must be an alternation of victory and de-
feat, which by reciprocal diminution of resources through
the evils of war, demonstrated peace to be mutually ben-
eficial. This year, however, threatened a blow to the naval
power of Athens that might materially affect the equi-
ponderancy. The maritime strength of Athens depended
in a considerable degree upon her foreign establishments
and dominions. As her treatment of these was frequently
imperious, and even oppressive, her dependencies did not bear
her supremacy without repining. Availing themselves
of the present difficulties, all the inhabitants of Lesbos, except
those of Methymne, resolved to separate from Athens. The
Athenians, feebly how great a loss the defection of this
island must be, sent out a fleet of forty galleys to attack
that of the Methymnians, who, finding themselves re-
pulsed, proposed terms of accommodation; which were
accepted by the Athenians. A suspension of hostilities
being agreed on, the Methymnians dispatched ambassadors
both to Athens and to Lacedæmon at the same time. The
ambassadors were told by the Lacedæmonians, they
should be fully heard at the approaching Olympic games,
where the other allies would have an opportunity of ad-
judging the conference. Then cylikes has transmitted to us
the import of what was urged by those ambassadors; from
which we see, that they admitted the treaty ancienly
concluded between the Lesbians and Athenians, and allign-
ed the ambition of the latter, not their present misfortunes,
as the reason that induced them now to relinquish that
treaty. The allies were satisfied with their reasons, and
admitted them into their confederacy. Informed of these
preparations, the Athenians fitted out a fleet of a hun-
dred sail, appeared unexpectedly off the promontory of
the island of Corcyra, and made a descent upon the Pe-
lonceans, while another fleet protected the coasts of At-
tica. Never had they raised a force composed of so many
different nations and independent cities; and never had
they overawed the Lacedæmonians, that they hurried back to
the defence of their own country. The
Athenians, in the mean time, pursued on the siege of Mity-
lea, whether they sent a detachment of a thousand sol-
diers, and the town was blockaded up both by sea and land.
The inhabitants receiving no assistance from the Lacedæ-
monians, and being refused by痕迹, were obliged to surrender
at discretion. The authors of the revolt, to the number
of more than a thousand, were conveyed to Athens, and then
put to death. Orders were at the same time issued to muf-
safe the rest of the inhabitants, by way of example. But
the people, shocked at such horrid cruelty, caused the de-
eree to be revoked, and dispatched counter orders; which
happily arrived at the帐篷 they were proceeding to put
the revolt in execution. (Thucydides.) Then the town was
defended, and the whole territory of the island, except
Methymne alone, was divided by lot among the inhabitants
of Athens. The fifth (B.C. 427) year of the war was
principally distinguished by the sedition of Corecyra. In
the course of hostilities, the Corinthians had captured a con-
siderable number of those islanders, and willyily treated
them with a gentleness and kindness which gained their affections.
Having brought them to this disposition, they earnestly
persuaded them, when they should return to their country,
to employ their efforts for reconciling the children with the
parent country, and detaching their fellow-citizens from
Athens, the tyrant over her allies. The Corecyrians were
dismissed, and arriving at home, endeavoured to reconcile
their countrymen to the Peloponnesians. The antratocratical
party very readily agreed, and formed a conspiracy for
maffacing the leaders of the democratic party. The com-
mons applied to the Athenians, who sent a fleet to affright
their patriots. The Peloponnesians also sent a squadron
to support the nobles; but the Athenians preferring their
maritime superiority, their enemies retired, and the demo-

crats were paramount. Their cruelty was too signal, as from
that time to give the name of Corecyra to every faction
of uncommon atrocity. The following account, in the ele-
phantine language of Dr. Gillies, contains an awful monument
of the dreadful effects of intestine diffusion.

"The unhappy prisoners were first confined in a dungeon.
Dragged face downward from thence, in parties of twenty at
a time, they were compelled to pass in pairs, their hands tied
behind their backs, between two ranks of their enemies,
armed with whips, prongs, and every instrument of heinous
and disgraceful torture. The writhing body in prison was
long ignorant of the ignominiosus cruelty inflicted on their
companions: but, as soon as they learned the abominable
terrors threatened, they refused to quit their confinement,
guarded the entrance, and invited, with one consent, the
Athenians to murder them. But the Athenians hesitated
not to commit this kind cruelty. The Corecyrian populace ventured not to force a pallage
from d. pair. They mounted the prison walls, uncovered
the roof, and overwhelmed those below with stones, darts,
and arrows. These weapons were destructive to many, and
furnished others with the means of destroying themselves,
or other each. They laid down their heads, opened their
breasts, exposed their necks, mutually soliciting, in plaitive
or frantic accents, the fatal stroke. The whole night (for
night intervened) was spent in this horrid scene, and the
morning presented a spectacle too shocking for description.
The obdurate hearts of the Corecyrians were incapable of
pity or remorse; but their relenting eyes could not bear the
light; and they commanded the bodies of their fellow-
citizens, now breathless or expiring, to be thrown on the
ends. Thus ended the sedition of Corecyra; but its consequences were not soon to end,
The contagion of that unhappy island, engendered a politi-
cal malady, which spread its baneful influence over Greece.
The antratocratical, and Hill more, the popular governments
of that country, had ever been liable to faction, which occa-

cionally blazed into sedition. But this morbid tendency,
congenial to the constitution of republics, thenceforth shewed
a more dangerous appearance, and betrayed more alarming
symptoms. In every republic, and almost in every city,
the intriguing and ambitious found the ready protection of
Athens, or of Sparta, according as their selfish and guilty
designs were screened under the pretence of maintaining
the prerogatives of the nobles, or affecting the privileges
and conveniences of the people. A virtuous and moderate an-
archy, an equal impartial freedom, are the conclusions which
we are to derive from this sedition. Sheltered by the
fierceness of their arms, the prodigious affluence delivered himself from the imprudence of his
creditor. The father, with unnatural cruelty, punished the licentious extravagance of his son; the son avenged, by parricide, the
fear severity of his father. The debates of the public
assembly were decided by the sword. Not satisfied with
victory, men thirsted for blood. This general disorder
overwhelmed laws human and divine. The ordinary courte
A Th e n s.

Of events was revealed: sentiments left their natural force, and words their usual meaning. Dullness and stupidity triumphed over abilities and invention; for while the crafty and ingenious were hiring fire-proof foars for enemies, men of bluster and might had immediate recourse to the two former principles. Hitherto the war had been carried on without any material advantage to either party. The following year (B.C. 427), more critical events took place: Demosthenes, a general of merit and enterprise, commanded the Athenian forces at Amphissa, which had been besetted on the western side of Thrace, by a whole garrison, together with that of the Athenian allies in Macedonia. Demosthenes undertook to relieve Acrocorinthus. The Athenians being continually harassed by the Boeotians, persuaded Demosthenes that it would be easier to overturn their country, before the inhabitants, who lived in scattered villages, widely separated from each other, could collect their forces, or attempt resistance. In pursuance of this advice, Demosthenes entered Acrocorinthus, took and plundered the town, and drove the inhabitants before him. During several days he marched unrestrained; but, having proceeded to Amphissa, the principal, or rather only city in the province, he found that his designs had by no means escaped the notice of the enemy. Living in a country abounding in defiles, and involved in woods, the Boeotians, though irreligious and debased in manner of warfare, yet employing a species of irrefistible fighting not unlike to that which, two and twenty centuries afterwards, has been used by the American Indians, defeated the regularly disciplined heroes of Athens, and Demosthenes was obliged to take refuge in Naupactus. The Athenian general, however, soon found means to irritate those barbarians to venture a contest in the plain, and, with great safe, obtained a signal victory. Elevated with this success, Demosthenes undertook an expedition to the western shore of Peloponnesus, and seized Pylos. The Spartans, eager to recover this important post, attempted to dislodge the enemy, but were defeated, and obliged to take refuge in Sparta, a small island upon the coast; and the Athenians, being masters of the sea, surrounded their retreat, and cut off all supplies of provisions. Anxious to save those troops, the Spartans sent ambassadors to Athens with proposals of peace. The ambassador, however, complained the extreme necessity that had obliged the Lacedaemonians to submit to this humiliation. The Athenians, in mind of the uncertain fate of arms, and exulted to embrace this opportunity of restoring tranquillity to Greece. But the Athenians, grown presumptuous by their good fortune, as well as by the flattering promise of their favourite demagogue Cleon, required, as a preliminary condition, that the troops confined in the island should lay down their arms, and be conducted to Athens, upon the promise of the Athenians to let them liberty as soon as the Lacedaemonians had delivered up the places conquered by them, from the Athenians. The Lacedaemonians refused to comply with this condition, and both parties prepared themselves for war. The Athenians, in the mean time, were very vigilant to prevent any provisions from passing into the island of Sparta. The Lacedaemonians, on the other hand, engaged the whole country round to contribute their utmost efforts to relieve the besieged troops, and promised to set free all the slaves who should succeed in carrying them provisions; which many did, at the extreme hazard of their lives. In the mean time, the Athenians in Pylos began, on their part, to be favoured for provisions. Cleon latter frequented the people, that the flow of the siege was owing to the inactivity of their commanders: and maintained, that a little vigour must very soon reduce the island, which he offered to accomplish himself. Having been accordingly sent thither, and having joined Demosthenes, they landed together in Sparta, and beat the enemy to the extremity of the island. The Lacedaemonians, however, took possession of a fortified town and defended, with the last desperate courage, the only post by which they could be attacked. But the general of the Athenians, having discovered a difficult pass that led to the fortification, marched that way, and appearing unexpectedly on the rear of the Lacedaemonians, called them to lay down their arms. The Lacedaemonians, exhausted with heat and fatigue, obeyed the summons, by laying their shields on the ground; and, after a short conference, they surrendered at different points. The Athenians, after erecting a trophy, remarked on board of their fleet. This siege continued from two days. Cleon is said to have en- ked 128 of those unhappy Spartans to be murdered. The reft were conveyed to Athens, and thrown into prison, till peace should take place; the Athenians threatening, at the same time, to put them all to death. The Lacedaemonians made many more incursions into their country. Soon after happened the edition of Megara. The inhabitants of that town, after expelling their magistrates, quarrelled among themselves, one party being for resuming their magistrates, the other, for delivering their towns into the hands of the Athenians. Brasidas, in the mean time, the chief officer of the Lacedaemonians, had, having come before Megara, its gates are immediately thrown open to him. The exiled magistrates returning soon after, and re- suming their authority, condemned to death one hundred inhabitants of the opposite faction. Brasidas advances into Thrace, subdues several cities, and lays siege to Amphipolis, a place of much importance to the Athenians, who then got the greatest part of their food. They therefore distrusted Timotheus, the famous historian, to its relief; but the place was taken before his arrival. His countrymen, however, imputed to him the loss of the place, and banished him at the instigation of Cleon. The Athenians, having about the same time advanced into Beotia, under the command of Demosthenes and Hippocrates, were defeated near Delium by the Thebans, who, after their victory, besieged and took that town. No decisive advantage had been hitherto obtained by either party. The Athenians and Lacedaemonians therefore agreed on a truce for a year, which Brasidas, who had been successful in all his enterprises, bore with great patience. Cleon, on the other hand, who had acquired much authority in Athens by means of his bold and vehement eloquence, incited his countrymen to renew the war. Being more presumptuous than skilful in military operations, he resolved to attempt the re-taking of Amphipolis, hoping to be assisted by a body of troops from Perdiccas king of Macedon. But Brasidas got the start of him, and threw himself into the town. To increase the presumption of Cleon, the Spartan general, who was well acquainted with his character, affected to be afraid of an encounter; but after making the proper dispositions, Brasidas rallied forth unexpectedly, and attacked the left wing of the Athenians, which, being the flower of their army, made a vigorous resistance. Brasidas, however, at last broke them, and killed six hundred, with very little loss on his own side. This attack disconcerted and terrified Cleon, who was killed by a Spartan soldier as he was flying from the battle. Brasidas was of the number of the Lacedaemonians perished this day, were brave and prudent, and deserves to be ranked among the Lacedaemonian heroes. It was the mother of this general, who, on hearing the exploits of her son com-
ATHENS.

mended, answered, "It is true, my son was a brave man; but I doubt not that Sparta has many citizens as brave as he."

The battle of Amphipolis removed the principal obstructions to peace. There was not any Spartan general qualified to accomplish the designs of Brasidas; and the Athenians, defeated by defeat, and humbled by disgrace, wanted the bold impudence of Clean to disguise their weakness, and varnish their misfortunes. (Ghilt.) With the disheartened remains of an enfeebled armament, they dispaired of recovering their Macedonian jurisdictions; and the greater part returned home well disposed for an accommodation with the enemy. These dispositions were contrived by the patriotic temper of Nicias, who had succeeded to the influence of Clean, and who fortunately discovered in the moderation of Pleidias, king of Sparta, a coadjutor extremely solicitous to promote his views. During winter, several friendly conferences were held between the commissioners of the two republics; and towards the commencement of the ensuing spring, a treaty of peace, and soon afterwards a defensive alliance, for fifty years, was ratified by the kings and elders of Sparta on the one side, and by the archons and generals of Athens on the other. In consequence of this agreement, which was intended to comprehend the respective alliances of the contending powers, all places and persons were exempt from the charge of the war, were to be held inviolably by the parties; the revolting cities in Macedon were specified by name; but it was regulated that the Athenians should not require from them any higher revenue than that supplied by the justice of Ar Pistides. (See Thucydiv.)

While the Athenians were thus engaged in wars, and often employed in injustice, their city produced a peripatetic who taught his countrymen and mankind the purest ethics that ever flowed from a human source. Socrates was now in the full vigour of his genius, which he employed in simplifying practical philosophy to the comprehension of common minds, and to facilitate the necessary connection between piety and virtue and happiness. (See Xenophon's Memorabilia.) From the perfections of the supreme intelligence he deduced his final government of the universe, which implied the immortality of the human soul. But the great object of his research was to discover the general laws by which, even in this life, the superintending providence had variously dispensed to men good and evil, happiness and misery. These laws he regarded as the promulgated will of the gods, with which, when clearly ascertained, it became our duty invariably to comply; since nothing but the most short-sighted folly could risk incurring the divine displeasure, in order to avoid pain or poverty, sickness or death, far less to enjoy pernicious gratifications, which leave a sting behind them. Reasoning on such principles, and taking experience only for his guide, he deduced with admirable perCPPicity the interests and duties of actions and individuals in all the complicated relations of society. The actions of men furnished the materials, their instruction formed the object, their happiness was the end of his discourse. Wherever his lessons might be most generally useful, there he was always to be found, frequenting at an early hour the Academy, Lycam, and other public gymnasias; punctually attending the forum at mid-day, the hour of full assembly; and in the evening, joining, without the affectation of austerity, in the convivial entertainments of his friends, or accompanying them in the delightful walks which adored the banks of the Ilissus. As a husband, a father, a citizen, and a soldier, the steady practice of his duty continually illustrated his doctrine. The conversation
Nicias, the Spartans withdraw their troops from Amphipolis: but they would restore neither that city nor the neighbouring places in Macedon, to the dominion of Athens. The Athenians, agreeably to the treaty, allowed the captives taken in Sphacteria to meet the longing embraces of their kin and friends: but the good policy forbade their surrendering Pylos, until the enemy had performed some of the conditions stipulated in return. Mutual unwillingness or inability to comply with the articles of peace, froze the feuds of animosity, which found a favourable soil in both republics. The authority of those representatives who supported the pacific measures of Nicias and Philibunax had expired. The Spartan youth wished, by new hostilities, to cancel the memory of a war, which had been carried on without profit, and terminated with dishonour; but the wiser part perceived that better success could not be expected while the Athenians possessed Pylos. In their eagerness to recover that fortress, they renewed their alliance with the Thebans, from whom they received Pharnabazus, which they hoped to exchange for Pylos; forgetting in this transaction an important clause in their treaty with Athens, "that neither of the contracting powers should, without mutual communication and concert, conclude any new alliance." The Thebans rejoiced in the prospect of embroiling the affairs of Athens and Sparta; and the Corinthians, guided by the same hostile views, readily concurred with the Thebans, and openly re-entered into the Lacedaemonian conspiracy. The Peloponnesian war was renewed with various success. The address of Alcibiades prevailed on the Argives to join the Athenians; and though the Spartans gained a considerable victory at Mantinea, the Athenians were on the whole pre-eminent. Elated with success, the Athenians undertook the conquest of the island of Melos, a state that never had been dependent on Athens, nor ever interfered in the Peloponnesian war. The Athenians sent Ambassadors to require the islanders to surrender. The conference between their deputies and the Melian statesmen is detailed by Thucydides, and is one of the most curious and interesting pieces recorded in ancient political history. It may indeed well be styled the moral creed of conquering adventurers, more openly promulgated than in modern manifestoes, but containing the same sentiments which dictated in our own times the partitioning scheme for the subdivision of Poland, with this difference, that modern subtleties are on a grand scale, but by some splendid plea of right, do homage to the justice which they transgress; whereas the Athenian debat did not shew common sense by such an unfounded pretext. He stated the real title to the feiture of other people's property, superior power; that the strong may use what freedom they please with the weak. There is not a single word said tending to prove either just right in the Athenians, or aggression in the Melians. The Athenian states the power of his country, and the miseries the Melians would suffer if they attempted resistance. The peroration to this celebrated discussion fully illustrates the principles on which the Athenians proceeded, and sums up the diplomatic reasoning: "You are determined," said the Athenian ambassador, "it seems, to learn by fatal experience, that fear never compelled the Athenians to desist from their designs, especially never to raise the siege of any place which they had once invested. For during the whole of this long commence-ment, you have not mentioned a single particular capable of affording any just ground of confidence. Deceived by the splendor of words, you talk of honour and independance, rejecting the offers of a powerful state, whose arms you are unable to resist, and whose protection you might obtain at the expense of a moderate tribute. Left shame should have any share in this dangerous behavior, we shall leave you to consult privately, only reminding you once more, that your present deliberations involve the face of your country." The Athenian ambassadors retired, and shortly afterwards the Melians recalled them, and declared their unanimous resolution not to intrust in one unlucky hour the liberty which they had maintained for five hundred years; depending on the vigorous assistance of their Lacedaemonian kinmen, and trusting especially in that divine providence which had hitherto preferred them amid the general revolutions of Greece. But they entreated the Athenians to accept their offers of neutrality, and to abstain from unprovoked violence. The ambassadors prepared for returning to the camp, leaving the commissioners with a farcical threat, "that all of men, in such a delicate situation, the Melians alone thought the future more certain than the past, and would grievously suffer for their folly, in preferring to the projects of certain and immediate safety, the deceitful present of hope, the instability of fortune, and the vain prospect of Lacedaemonian aid." The Athenians, irritated by opposition, invaded without delay the capital of Melos, which was blocked up for several months by sea and land. The besieged, after suffering cruelly by famine, made several desperate sallies, seized the Athenian magazines, and destroyed part of their works. But towards the end of winter, their resistance was defeated by the vigorous efforts of the enemy, combined with domestic treachery. The males above the age of fourteen were put to the sword; the women and children were subjected to perpetual servitude; and five hundred new inhabitants, drawn from the neighbouring colonies of Athens, were sent to occupy the vacant lands which had been cultivated and adored for seven centuries by the labour of the exterminated Melians.

Successful injustice encouraged the Athenians to more arduous schemes of aggression and conquest, and they hoped to subjugate the whole course of the Mediterranean. Under these visionary fancies, they projected an expedition to Sicily, which proved so fatal to Athenian greatness. With the usual policy of conquerors, they maintained a close intercourse with the weaker states of a country which they projected to subdue. Since the death of Pericles, they had concluded a treaty with the Leontines, who, being band prefied by the Syracusans, applied for assistance to their new conquerors; for this purpose they sent an embasssy to Athens, at the head of which was the wealthy Gorgias, who pleaded the cause of the Leontines in an oration so elegant and pathetic, that the request of the ambassa-dors was granted; and the Athenians sent a fleet to Rhegium to subdue the Leontines. Next year (B.C. 415), they sent thither a more numerous fleet still, under pretence of afflicting the town oppressed by the Syracusans, but in fact to open to themselves a way to the conquest of Sicily. Alcibiades, by his harangues, inflamed the Athenians still more and more to this undertaking, and talked of nothing less than extending the conquests of Athens over Africa and Italy. While the minds of the Athenians were full of these mighty projects, ambassadors arrived from the Egyptians, to implore their assistance against the Selinuntines, who were supported by the Syracusans; offering at the same time to pay the troops that should be sent to their assistance. The Athenians, tempted by these promises, named Alcibiades, Nicias, and Lamarchus, to command a fleet destined to succour the Egyptians. Nicias renounced against this expedition in the strongest terms, and painted out in the most lively colours what ruinous consequences might thence result to the republic. He represented to the Athenians, that they had but too many enemies on their hands already, with-
pouring out their most earnest vows for the success of their fellow-citizens. The fleet directed its course towards Rhegium, whether they dispatched some ships before the rest, to see that the money promised by the Egyptians was ready; of which, however, they found no more than thirty talents provided. Nicias availed himself of this circumstance to enforce the reasons he had insisted on against the expedition, and advised to terminate the dispute between the Egyptians and Sicilians in an amicable manner; to oblige the former to fulfill their engagements; and then to return to Athens. Alcibiades, on the contrary, said it would be difcerned to return without performing some signal exploit with so powerful an armament; that they ought to endeavor to detach the Greeks in Sicily from their connection with Syracuse, to bring them over to their own party, and after obtaining from them refreshments both of troops and provisions, to attack Syracuse. Lamachus advised to march immediately against Syracuse; but the opinion of Alcibiades prevailed. They therefore continued their course for Sicily, where Alcibiades reduced Catana. At Athens the enemies of Alcibiades, intent alone on gratifying their resentment, without regarding the public interest, took advantage of his absence to renew against him an accusation of having in a debauch profaned the mysteries of Proserpine and Ceres; and they prosecuted the accusation with the most invertebrate malice and animosity. Many persons were accused, and thrown into prison, without being even permitted to be heard; and a velix was dispatched to bring Alcibiades to land trial before the people. To this he apparently condescended, and went on board of the galley; but on arriving at Thurium, he disappeared. Not having therefore obeyed the summons within the limited time, he was condemned to death for contempt, and his effects were confiscated. (Thucydides, i. vi.) The departure of Alcibiades spread apprehension through the army. Nicias, now chief commander, by his irreproachable conduct, restored the ardour of the Athenians to cool, and he spent the greatest part of the sumner inactive at Catana. The Athenian soldiers, impatient of such dilatory proceedings, reproached their general, who, to please the army, resolved to besiege Syracuse. Though slow in counsel, yet vigorous in conduct, he conducted his attacks with so much ability, that the inhabitants were inclined to surrender. Already several states of Sicily and Italy had declared in his favor, when a Lacladianon general named Gyllipus entered the besieged city, with a few troops which he had brought from Peloponnesus, or collected in Sicily. Nicias might have prevented him from landing in the island, but left the opportunity; an irreparable fault, which proved the source of all his misfortunes. Gyllipus revived the courage of the Syracuseans, defeated the Athenians, and held them blocked up in their intrenchments. Athens sent to Sicily another fleet consisting of about seventy-three galleys, under the command of Demothers and Eurymedon, and a second army of five thousand men heavily armed, and some light troops. Demothers having left two thousand men at the attack of an important post, and considering that the sea would soon be no longer navigable, and that the troops were waiting away by divers, proposed to abandon the enterprise, or transport the army to some healthier situation. When they were on the point of setting sail, Nicias, terrified at an eclipse of the moon, which spread confusion through the camp, concluded the augurs, who directed him to wait twenty-seven days longer. Before the expiration of his time, the Athenians, vanquished by sea and land, no longer able to remain under the walls of Syracuse for want of provisions, nor to escape out of the harbour, the mouth
mouth of which was shut up by the Syracusans, took the
resolution to abandon their camp, their sick, and their ships,
and retire by land into some town of Sicily. They began
their march to the number of forty thousand men, includ-
ing not only the troops furnished them by the states of
Italy and Sicily, but the crews of the galleys, the work-
men, and slaves. The Syracusans, by feizing the docks,
and breaking down bridges, and other obstructions, im-
peded the retreat of the Athenians, while at every step they
harried their track and rear. The retiring forces for eight
whole days had to struggle against new obstacles continually
increasing. But Demosthenes, who commanded the rear-
guard, composed of six thousand men, losing way in his
march, was pushed into a confined place, and, after prodigies
of valour, obliged to surrender on condition that his soldiers
should have their lives granted them, and be spared the hor-
rors of a dangerous siege. Nicias, having failed in a negotiation he
had entered into, conducted the remainder of the army as
far as the river Alinurus. On his arrival there, the greater
part of the soldiers, terrified by a burning thirst, rushed
in confusion into the river, while others were driven into it
by the enemy. Such as attempted to save themselves by
swimming found on the opposite shore steep banks lined
with dartmen, who made a terrible slaughter of them.
Eight thousand men perished in the attack; till at length
Nicias thus addressed Gylippus: "Diope of me as you
shall think proper; but shew mercy at least to these unhappy
soldiers." Gylippus immediately put an end to the carn-
age. The Syracusans returned to their city, bringing
back with them even thousand prisoners, who were thrown
into the quarries, where for many months they experienced
terrifying miseries. Numbers of them perished there, and
others were sold as slaves. Nicias and Demosthenes
were among the sufferers. A few escaped both death and
bondage through the charms of dramatic poetry, by recit-
ing passages from the beautiful and pathetic tragedies of
Lunipides.

The disgraceful expedition of the Sicilians filled Athens
with consternation and difmAY, and she had reason to dread
still greater calamities. Her allies were ready to shirk off
the yoke; the other states of Greece were conspiring her
ruin; the Peloponnesians already thought themselves justi-
fied by her example in breaking the truce. Already she
had discovered in their operations, more skilfully planned
and conducted, the spirit of vengeance, and the superior genius
by which they were directed. Alcibiades enjoyed at Laced-
emon that respect and influence he everywhere obtained.
It was by his advice that the Lacedaemonians adopted the
resolution of sending succours to the Syracusans, renewing
their invasions into Attica, and fortifying, at the distance of
one hundred and twenty fadium from Athens, thepolis of
Decelea, which held that city blocked on the land side. To
annihilate the power of Athens, it was necessary to favour
the revolt of her allies, and destroy her navy. Alcibiades
repaired to the coasts of Afia Minor; and Chios, Miletus,
and other flourishing cities, declared for the Lacedaemonians.
His accomplishments he captivated Tissaphernes, the
governor of Sartio; and the king of Persia engaged to pay
the fleet of Peloponnesus. This second war, conducted
with more regularity than the former, would quickly have
been terminated, but not Alcibiades, pursued by Agis,
king of Lacedemon, whose wife he had seduced, and by
the other chiefs of the league, who took umbrage at his
glory, at length considered that, after avenging himself on
his country, it was now only remained for him to protect it from
inevitable ruin. With this view, he contrived to suspend
the operations of Tissaphernes, and the departure of the
Persian succours, under the pretense that it was the interest
of the great king to suffer the nations of Greece mutually
to exasperate each other. The Athenians having soon after
resolved the decree for his banishment, he put himself at
their head, reduced the strongholds of the Hellespont,
forced one of the Persian governors to sign an advantageous
treaty with the Athenians, and the Lacedaemonians to sue
for peace. Their demand was rejected; for, deciding them-
selves invincible henceforward under Alcibiades, the Athe-
nians made a rapid transition from the most profound con-
firmation to the most infantile presumption. The hatred
with which they were animadvised against that general was as
quickly succeeded by the most extravagant gratitude, and the
most unbounded affection. When he returned to his own
country, his arrival, and the pains he took to justify
his conduct, were a series of triumphs for himself, and of
public rejoicings for the multitude. When, amidst the
annihilations of the whole city, they saw him fall from the
Piraeus with a fleet of a hundred ships, no doubt was en-
terained but that his rapid victories would soon force the
inhabitants of the Peloponnesus to submit to the law of the
conqueror; the arrival of a courier was every moment ex-
pected with the news of the destruction of the enemy, and
the conquest of Ionia. In the midst of these flattering ex-
pectations, they learnt that fifteen of the Athenian galleys
had fallen into the hands of the Lacedaemonians. The
engagement took place during the absence, and in contempt
of the precise orders, of Alcibiades, who had been obliged
to pass into Ionia to levy contributions for the subsistence of
his troops. On the first intelligence of this check, he in-
stantly returned, and offered battle to the victor, who did
not venture to accept it. He had retrieved the honour of
Athens; the loss was trifling, but it sufficed for the jealousy
of his enemies. They exasperated the people, who flung
him from the general command of the armies with as much
precipitation as they had manifested in inveigling him with
that dignity. After the second exile of Alcibiades, the
war continued for several years, the Spartans being now
commanded by Lyfander, after Alcibiades the first general
of Greece. Till the twenty-seventh year of the war, the suc-
cess was various, and operations were principally maritime.
The great object of the Peloponnesians was the reduction of
the Athenian colonies; and the northern parts of the
Aegean sea were the chief scenes of warfare. In the twenty-
seventh campaign, a large Athenian fleet was stationed at
the mouth of the river Egos. Considering themselves as
incontrovertibly superior to the enemy, many of the Athe-
nian vessels left the ships, and were carelessly dispersed on
shore. Alcibiades, being in that neighbourhood, and,
though in banishment, anxious for the welfare of his coun-
try, warned the Athenian generals of their hazardous posi-
tion, and the want of discipline among their forders and
seamen; after representing to them the danger of their situa-
tion, on an inhospitable coast, without either harbours or
cities to which they might retire in case of necessity, he of-
fered to co-operate with them, byfalling upon the enemy at
land, with some Thracian troops under his command. But
the generals despised his advice, and refused, out of jealously,
accept of his service. Lyfander, in the mean time, prepared
to attack the Athenians when totally off their guard. Hav-
ing learned from his scouts, that the enemy were struggling
with even more than their usual carelessness, Lyfander em-
braced the opportunity; and bore down upon the ships thus
defeated by the chief portion of the fighting men. The
victory was complete, if thence be called a victory where
there was scarcely any resistance. The vigilant activity of
Conon endeavoured feaunably to assemble the strength of
the
the Athenians; but his advice was disregarded by officers incapable and unworthy of command, and his orders were despised by seamen unaccustomed and unwilling to obey. At length they became fearful of the danger, when it was too late to avoid it. Their ships were taken, either altogether empty, or manned with such feeble crews as were unable to work, much less to defend them. The troops and sailors who fled to the shore from different quarters, and with disordered precipitation, were attacked by the regular onset and disciplined valor of the Peloponnesians. Those who fought were slain; the remainder fled into the utmost recesses of the Chersonesus, or took refuge in the Athenian fortresses, which were scattered over that peninsula. Out of a fleet of an hundred and eighty sail, only nine vessels had escaped, eight of which were conducted by Conon to the friendly island of Cyprus, while the ninth carried to Athens the melancholy news of a disaster equally unexpected and fatal. Lytfander proposed to pursue his blow to the destruction of the Athenians, reduced all the colonies of Athens under the dominion of Sparta, and proceeded to the siege of Athens. While he invested this city by sea, a powerful army co-operated with him by land. The Athenians, having defended themselves for three months, were reduced to the extremity of distef, and at length this celebrated city was captured, dismantled, and rendered a dependency of Sparta. Such was the ruinous termination of the Peloponnesian war. (B.C. 404.) The conquerors placed the government in the hands of thirty persons, who, from their capacity and cruelty, cared and acquired the name of the thirty tyrants. During their sway Athens had scarcely any political existence, and its history is only marked by domestic injustice and misery. The unhappy Athenians cast their eyes on Aulis, in the confidence that he could, and the hopes that he would, effect their deliverance. But Lyfander, entertaining a similar idea of the powers and dispositions of that illustrious exile, prevailed on Pharnabazus, the Persian satrap, to perpetrate his murder. The thirty tyrants, seized from the fear of such an avenger, proceeded to greater enormity than ever; until Thrasybulus, inheriting the magnificent spirit of a free Athenian, put himself at the head of his injured countrymen, expelled the tyrants (B.C. 401), and, favoured by the diffusions of the Spartan leaders, re-established a free government in Athens. Deprived, however, of her colonial, naval, and many of her commercial resources, Athens continued of little importance in the public transactions of Greece. The chief domestic event which distinguishes this part of Athenian history, is the fate of Socrates; but of the life as well as of the death of this extraordinary sage, a full account will be given under the appropriate article.

While the Athenians had thus lost not only pre-eminence but independence and political importance, they were still distinguished for good and bad qualities, which had since been conspicuous in the days of their prosperity. Genius was still transcendent, though directed to different objects from those which had employed a Themistocles and a Cimon. Instead of active efforts for aggrandizing their country, Athenian talents were now chiefly employed in pursuits defined to delight and instruct all the enlightened world. Poetry, history, and philosophy by different means purified the same end, the promotion of wisdom, virtue, and happiness. But as epic and dramatic excellence had been already carried to the highest conceivable perfection; the poetry of Athens at this period was less pre-eminent than her history and philosophy. Thucydides and Socrates being dead, Xenophon and Plato occupied the highest rank.

The over-bearing influence with which the Spartans exercised their supremacy over the Grecian states proved ultimately the means of their degradation, and enabled the Athenians to recover a certain portion of their political power, and their onus among their neighbours. The confederacy which was formed against Sparta enabled the Athenians to defeat the Lacedaemonians at sea, to regain their naval superiority, and to rebuild their harbour and walls. (B.C. 394.) This revolution from dependency to maritime supremacy they owed to the courage and policy of the celebrated Conon. (See CONON.) ThrasybulusFeedback the exploits of Conon, and the Athenians resumed the command of maritime settlements, which had been wrested from them ten years before by the victorious Spartans. The reviving fortune of the Athenians recalled their military energies, and various commanders started up, not unworthy of the native country of Pericles and Alcibiades. Iphicrates, Chabrias, and Timotheus, gave glorious specimens of valour and conduct; but the peace of Antalcidas (B.C. 387) suspended their exertions. For several years after this treaty, the Spartans endeavoured by stratagem and surprize to re-establish their predominancy; they seized the island of Thebes, and attempted to make themselves masters of the harbour of Athens, though nominally at peace with both countries. The Athenians joined with the Thebans in revenging this outrage; Chabrias repulsed the army of Sparta, while Iphicrates and Timotheus destroyed her fleets, and Athens rose to an equality with her rival. Peace being again concluded between the Spartans and Athenians, the latter were spectators of the contest between Sparta and Thebes, where the renowned Epaminondas gave Lacedaemon (B.C. 371) such a blow to Spartan power; the Athenians were invited by the victors to join in an alliance for crushing their ancient enemies; but they regarded found policy more than repentment, and would not throw their weight into the Theban scale, already preponderant. The Theban hero having still further reduced the Spartans, and invaded Laconia, the Athenians took active steps for rendering affiance to the now weaker party, and sent an army to defend Peloponnesus; but the battle of Mantinea (B.C. 362) arrested Epaminondas in the career of victory. After him no Theban arose fit for imitating his example, or executing his designs. The Thebans became haggard; the Spartans on the other hand were exhausted. Athens did not fail to take advantage of the contests which had weakened her two foes in the dominion of Greece. Taught by experience, they did not attempt to subdue the territories of her warlike neighbours; but the numerous islands of the Aegean and Ionian seas, the various cities of "Thrace and Asia, invited the profitable commerce of their fleet, which they might now employ in foreign conquests, fears of domestic envy. It appears, that from after the death of Epaminondas, Euboea again acknowledged the authority of Athens, an event facilitated by the division of the Theban partisans belonging to that place, in the battle of Mantinea. From the Thracian Bosphorus to Rhodes, several places along both shores submitted (B.C. 350.) to the arms of Timotheus, Chabrias, and Iphicrates; men, who, having survived Agesilaus and Epaminondas, were far superior in abilities and in virtue, to the contemporary generals of other republics. The Cyclades and Corcyra coursed the friendship of a people able to interrupt their navigation, and to destroy their commerce: Byzantium had become their ally; and there was reason to hope that Amphipolis would soon be reduced to submission. Such multiplied advantages revived the ancient grandeur of Athens, which once more commanded the sea, with a fleet of near three hundred sail, and employed the best half of her citizens and subjects in ships of war or commerce. This tide of
of prosperity, flowing so grateful after adversity and oppression, proved eventually the cause of their ruin. The populace abandoned themselves to idleness, dissipation, and lewdness; and to supply their extravagances, sought proper inequalities and injustice. To direct the formation, and lead the execution of such schemes, a daring and profligate leader presented himself in Chares, whose soldier-like appearance, blunt address, and bold impudent valour, masked his licentious ambition, and rendered him the idol of the populace. His perfidy was gigantic and robust, his voice commanding, his manners haughty; he affected positively, and promised boldly; and his presumption was so excessive, that it concealed his incapacity, not only from others, but from himself. Though an enterprising and successful partisan, he was unacquainted with the great duties of a general; and his defects appear the more striking and palpable, when compared with the abilities of Iphicrates and Timotheus, his contemporaries, who prevailed as often by address as by force, and whose conquests were secured to the republic by the moderation, justice, and humanity with which they had been obtained, and with which they continued to be governed. Chares proposed a very different mode of administration; he exhorted his countrymen to supply the defects of their treasury, and to acquire the materials of those pleasures which they regarded as essential to their happiness by plundering the wealth of their allies and colonies. This counsel was too faithfully obeyed; the vexations anciently exercised against the tributary and dependent states, were renewed and excelled. The weaker communities complained and remonstrated against this intolerable incapacity and oppression; while the isles of Chios, Coos, Rhodes, as well as the city of Byzantium, prepared openly to revolt, and engaged with each other to repel force by force, until they should obtain peace and independence (B. C. 358). Chares, probably the chief instrument as well as the adviser of the arbitrary measures which had occasioned the revolt, was sent out with a powerful fleet and army to quash at once the hopes of the insurgents. He failed towards Chios, with an intention to seize the capital of that isle, which was supposed to be the centre and prime mover of rebellion. The confederates, informed of his motions, had already drawn thither the greatest part of their force; the city of Chios was besieged by sea and land; the insurcend were defended themselves with vigour; Chares found it difficult to repulse their fanatics; his fleet attempted to enter their harbour without success; the ship of Chabrias alone penetrated thus far; and that able commander, whose valour and integrity merited a better fortune, though defeated by the fleet, yet forsook not the ship extricated to him by the republic. His companions threw away their shields, and fended themselves by swimming to the Athenian squadron, which was full west by their reach; but Chabrias, fighting bravely, fell by the darts of the Chians, preferring an honourable death to a disgraceful life. Encouraged by advantages over their enemy, who had at first affected to despise them, the insurgents augmented their fleet, and ravaged the isles of Lemnos and Samos. The Athenians, indignant that the territories of their faithful allies should fall a prey to the depredations of rebels, fitted out, early in the next year, a new armament under the command of Mneheus, the son of Iphicrates, and son-in-law to Timotheus, expecting that the new commander would respectfully listen to the advice of those great men, who perhaps declined acting as principals in an expedition where Chares professed any share of authority. That general had raised the siege of Chios, and now cruised in the Hellespont; where, being joined by Mneheus, the united squadrons amounted to an hundred and twenty sail. It was immediately determined to cause a diversion of the enemy's forces from Samos and Lemnos, by laying siege to Byzantium. The design succeeded; the allies withdrew from these isles, collected their whole naval strength, and prepared vigorously for defending the principal city in their confederacy. The hostile armaments approached each other with a resolution to join battle, when a sudden and violent storm arose, which rendered it impossible for the Athenians to bear up to the enemy, or even to keep the sea, without being exposed to shipwreck. Chares alone confidently insisted on commencing the attack, while the other commanders, more cautious and experienced, perceived the disadvantage, and declined the unequal danger. His impetuousity, thus overruled by the prudence of his colleagues, was converted into resentment and fury; he called the sailors and soldiers to witness his opposition, which he branded with every odious epithet of reproach; and with the first opportunity, dispatched proper messenger to Athens, to accuse them of incapacity, cowardice, and total neglect of duty. The accusation was supported by venal orators in the pay of Chares; Timotheus and Iphicrates were tried capitally. The former truel to his innocence and eloquence; the latter used a very extraordinary expedient to sway the judges, conformable, however, to the spirit of that age, when courts of justice were frequently instruments of oppression, governed by every species of undue influence, easily corrupted and easily intimidated. The taxeors, or light infantry, who had been armed, disciplined, and long commanded by Iphicrates, enjoyed the same reputation in Greece, which the "Fabia" folders afterwards did in Italy. They were called "Iphicratian" troops, from the name of this commander, to whom they owed their merit and their fame; and to whose person (notwithstanding the strictness of his discipline) they were strongly attached by the ties of gratitude and affection. The young and brave of this celebrated band readily obeyed the injunctions of their admired general; surrounded, on the day of trial, the benches of the magistrates, and took care feasonably to display the points of their daggers. It was the law of Athens, that after preliminaries had been adjusted, and the judges assembled, the parties should beheard, and the trial begun and ended on the same day; nor could any person be tried twice for the same offence. The rapidity of this mode of procedure favoured the views of Iphicrates; the magistrates were overawed by the imminence of a danger which they had neither strength to resist nor time to elude; they were compelled to an immediate decision; but instead of the sentence of death, which was expected, they imposed a fine on the delinquents, which no Athenian citizen in that age was in condition to pay. This severity drove into banishment those able and illustrious commanders. Chabrias failed to Chalce, in Euboea, and afterwards to the isle of Lebos, both which places their valour and abilities had recovered for the republic, and which, being chosen as his residence in disgrace, sufficiently convince the mildness of his government, and his moderation in prosperity. Iphicrates travelled into Thrace, where he long resided; he had formerly married the daughter of Cotys, the most considerable of the Thracian princes, yet he lived and died in obscurity; nor did either he or Timotheus henceforth take any share in the affairs of their-ungrateful country. Thus did the social war destroy or remove Iphicrates, Chabrias, and Timotheus, the best generals whom Greece could boast; and, honest Plecon expeetcd, the last venerable remains of Athenian virtue. (See Gillies, vol. ii. p. 384.)

Sunk in idleness, amnesia, and despair, the Athenians wanted nothing to complete their destruction but an ambitious and enterprising foreign enemy. Thus they found in Philip,
Philip, king of Macedon, who first extended his power in countries not immediately connected with Greece, and at the same time increased the means of farther extension. Meanwhile a war broke out in Greece; first between the Thebans and Phocaeans, concerning lands annexed to the temple of Delphi, which afterwards involved the greater part of Greece, and among others the Athenians. Philip, taking advantage of their difference, marched towards the interior of Greece, knowing that the Athenians were the most immediately intended to oppose his progress, and the abhor, if they exerted themselves, to do it effectually; he directed a great part of his policy to the prevention of those exertions. He was aware that in a democracy the governors are the tools of the demagogues; by flattery, by carelesse, and by bribery, he effectually procured the favour of those leaders of the populace. One patriot, however, he could never corrupt; Demosthenes exerted the whole force of his oratorical eloquence (from B.C. 356 to 326) to rouse the Athenians to a sense of their danger, from the encroachments of Philip. (For the nature and character of Demosthenes's eloquence, see article Demosthenes.) This powerful orator occasionally roused his countrymen from their lethargy, but never to such great exertions as he declared necessary, and as the circumstances required; on gaining temporary partial advantages, they returned to their indolence and licentiousness. Philip amased them by emolument; seduced them by their demagogues; and continued his encroachments: when they should have been sending powerful armaments, they sent ambassadors: these, Demosthenes excepted, Philip corrupted; and the interests of the Athenians were betrayed. In vain Demosthenes demonstrated the views of Philip, and treachery of the demagogues; he could not stimulate them to vigorous and persevering efforts, until Philip's power became too formidable for resistance. A combination of the states of Greece was at length formed against Philip; but too late to be successful. The allies were totally defeated at Chaeronea (B.C. 338), and the Athenians became a dependency of Macedon. A popular writer (see Travels of Anacharsis, vol. l. p. 112.) observes, that the history of the Athenians, properly speaking, commences about 150 years after the first olympiad: and concluded at the battle of Chaeronea, it continues scarcely more than 300 years. In this series of years it is easy to discover certain important intervals, which mark the rise, progress, and decline of their empire; and if these can be distinguished by characteristic names, the first may be called the age of Solon, or of the laws; the second, the age of Themistocles and Aristides, or the age of glory; and the third, that of Pericles, or the age of luxury and the arts.

The Athenians after the battle of Chaeronea never recovered their importance. During the contentions of Alexander's successors, they followed the fortunes of different claimants, but chiefly adhered to the side of Demetrius and his descendants, who established themselves on the throne of Macedon. When the intrigues of the second Philip with the renowned Hannibal provoked the Romans to invade Greece, the Athenians joined the invaders, and Athens became the dependent ally of the conquerors. In the Mithridatic war, Athens having been conquered by the Asiatic monarch, was besieged by Sylla (B.C. 87), who took and plundered their city, demolished its walls and fortifications, butchered its inhabitants, and reduced it to a state of defoliation. When this horrid subfide, Athens enjoyed profound tranquillity till the civil war broke out between Caesar and Pompey, when it took part with the latter, and was reduced to great miseries by Calenus, the lieutenant of Caesar. Disappointed in their hopes of being relieved by Pompey, the Athenians surrendered at discretion, and were more kindly treated than they expected; for Caesar not only pardoned them, but took them under his protection, alleging that he feared the living for the sake of the dead. But averse from ferititude, they no sooner heard of Cæsar's death than they openly declared for his murderers; and bringing Brutus and Cassius into their city, and even erecting statues to them, which were placed next to those of Harmodius and Aristogiton. After the defeat of Brutus and Cassius, they attached themselves to Antony, who restored them to their former privileges, and enlarged their dominions, by subjecting to Athens the islands of Céa, Sicæthus, Paparathus, and Aegina. Of this island, however, they were deprived by Augustus, and forbidden to sell the freedom of their city, as a punishment which he inflicted upon them for their ingratitude to Julius Cæsar. Towards the latter end of the reign of Augustus, they revolted, but were soon reduced to their former obedience. Germanicus, the adopted son of Tiberius, honoured them with the privilege of having a Flaminus, which was considered as a mark of sovereign power. This grant was confirmed by him to Cæsar and his successors, under whose protection they maintained their ancient form of government till the reign of Vespasian, who reduced Attica, with the rest of Greece, to a Roman province, saying, "that the Greeks knew not how to enjoy their liberty." But the emperor Adrian, who had been prætor of Athens before his accession to the imperial dignity, restored to them the full enjoyment of their former privileges. He repaired the two ports of the Piræus and Munchia, and added a whole district of new buildings to the old city. This quarter was called Adrianopolis, from Adrian, whom the Athenians styled the second founds. of their city. The privileges granted by Adrian were confirmed and extended by his successors M. Antonius Pius and M. Antoninus the philosopher. Severus abridged them of many privileges in revenge for an affront which he received at Athens, while he sojourned in that city. They were favoured by Valerian; but the city was taken and plundered by the Goths in the reign of Gallicanus, or of Claudius (A.D. 267 or 268); but the invaders were soon obliged, by a precipitate flight, to abandon their new conquest. Contantine the Great was a peculiar patron and benefactor of the Athenians. He honoured their chief magistrates with the title of grand duke, an office at first annual, but afterwards hereditary; and granted them many privileges, which were confirmed and enlarged by Constan- tinus, who also put them in possession of several islands in the Archipelago. In the time of Theodosius I. 380 years after Christ, the Goths laid waste Thessaly and Epirus; but Theodore, general of the Acharans, preferred the cities of Greece from pillage; and a number of mable was erected to him at Athens by order of the city. During the reigns of Aurelius and Honorius, the Athenians were cruelly harried and assaulted by the Goths under Attilic (A.D. 366), who reduced all their flattery and magnificent structures into heaps of ruins, and removed the invaluable treasures of antiquity. Synclus, a writer of that age, says, that Athens resembled the bleeding and empty skin of a slaughtered victim. After Athens became only part of a Roman province, it still remained the central point in the republic of letters, and continued to be frequented by all who desired to acquire that attainm which so highly valued by the ancients, and that standard which enabled them to estimate, with peculiar accuracy, the real beauties of every work of genius and art. Here too, and here only, were to be learned the true principles of eloquence. All, therefore, who applied themselves to public speaking, and

dread pounds; ferling. After the death of Marcus, these liberal donations, and the privileges attached to the thrones of science, were abolished and revived, diminished and enlarged: but some vestige of royal bounty may be found under the successors of Constantine: and their arbitrary choice of an unworthy candidate might tempt the philosophers of Athens to regret the days of independence and poverty. It is remarkable, that the impartial favour of the Antonines was bestowed on the four adverse facts of philosophy, which they considered as equally useful, or at least as equally innocent. Secrates had formerly been the glory and the reproach of his country; and the first illusion of Epicurus so strangely banalized the poems of the Athenians, that by his exile, and that of his oracle, they fenced all vain disputes concerning the nature of the gods. But in the ensuing year they called the halcyon decree, restored the liberty of the schools, and were convinced by the experience of ages, that the moral character of philosophers is not affected by the diversity of their theoretical speculations.

But the schools of Athens were suppressed by an edict of Julianus; an edict, which excited the grief and indignation of the few remaining notaries of Grecian science and superstition. Seven friends and philosophers, Diogenes and Hermas, Eulalius and Priscian, Damascius, Isidore, and Simplicius, who differed from the religion of their sovereign, resolved to seek in a foreign land the freedom of which they were deprived in their native country. Accordingly the seven fugitives sought an asylum in Persia, under the protection of Choeranes; but, dissatisfied and disappoitted, they hastily returned, and declared that they had rather die on the borders of the empire, than enjoy the wealth and favour of the barbarian. These associates ended their lives in peace and obscurity; and as they left no disciples, they terminate the long list of Grecian philosophers, who may be justly praised, notwithstanding their defects, as the wisest and most virtuous of their contemporaries.

From the time of Arcadius and Honorius, nothing memorable concerning the Athenian state has been recorded in history till the thirteenth century, when it was in the possession of Baldwin, as Nicaea informs us, and unsuccessfully besieged by Theodosius Lascaris, one of the generals of the Greek emperor. In the 252 years, from A.D. 1204 to A.D. 1456, that elapsed between the first and last conquest of Constantinople; the possession of Greece was disputed by a multitude of petty tyrants. However, in the partition of the empire, the principality of Athens and Thebes was assigned to Ortho de la Roche, a mountebank and buffoon of Burgundy, with the title of great duke. Ortho followed the standard of Boniface, the Marquis of Montferrat; and the ample plate which he acquired, was peaceably inherited by his son and two grandsons, till the family was changed by the marriage of an heiress into the elder branch of the house of Brienne. The son of that marriage, Walter de Brienne, succeeded to the duchy of Athens; but his family and nation were expelled by the Catalans, who seized possession of Attica and Boeotia. During fourteen years they were the terror of the Grecian states. Their factions drove them to acknowledge the sovereignty of the house of Aragon; and, during the remainder of the fourteenth century, Athens, as a government or an appendage, was successively belauded by the kings of Sicily. After the French and Catalans, the third dynasty was that of the Accioli; a family, plebeian at Florence, potent at Naples, and sovereign in Greece. Athens, which was embellished with new buildings, became the capital of a state, that extended over Thebes, Argos, Corinth, Delphi, and a part of Thessaly; and their reign was finally determined by Mahomet the second, about the year 1455, who starved the last duke, and educated his sons in the discipline and religion of the feraglio. This fatal catastrophe, which happened near 2000 years after the time of Phidias, brought Athens, together with the whole of Greece, under the despotic domination of the Turks. In 1462, the Venetians landed at the Piraeus, surprised the city, and carried off their plunder and captives to Venice. In 1487, it was taken, after a short siege, by the Venetians; and not many years after, retaken by the Turks, under whose yoke it has ever since continued. As to the present state of Athens, though no more than the shadow of its former self, it still contains about 8 or 10,000 inhabitants; of these, three fourths are Greeks in religion and language; and the Turks, who compose the remainder, have relaxed, in their intercourse with the citizens, somewhat of the pride and gravity of their national character. The olive-tree, the gift of Minerva, flourishes in Attica; nor has the honey of mount Hymettus lost any part of its exquisite flavour: but the legalized trade is monopolized by strangers: and the agriculture of a barren land is as advanced to the vagrant Walachians. The Athenians are still distinguished by the futility and acuteness of their understanding; but these qualities, unless emboldened by freedom and enlightened by study, will degenerate into a low and feline cunning; and it is a proverbial saying of the country, "From the Jews of Thebassonia, the Turks of Neapogrot, and the Greeks of Athens, good Lord deliver us!" This artful people has eluded the tyranny of the Turkish sultans, by an expedient which alleviates their servitude and aggravates their shame. About the middle of the last century (the 17th) the Athenians chose for their protector the Kilif Aga or chief black eunuch of the seraglio. This Egyptian slave, who possesses the sultan's ear, confederates the tribute of 30,000 crowns: his lieutenant, the Wayvode, whom he annually confirms, may reserve for his own account five or six thousand more; and such is the policy of the citizens, that they seldom fail to receive and punish an oppressive governor. Their private differences are decided by the archbishop, one of the richest prelates of the Greek church; since he possesses a revenue of 1000l. ferling; and by a tribunal of the eight generals or elders, chosen in the eighth quarters of the city: the noble families cannot trace their pedigree above 300 years; but their principal members are distinguished by a grave demeanor, a fair cap, and the lofty appellation of archon. By some, who delight in the contrast, the modern language of Athens is represented as the most corrupt and barbarous of the several dialects of the vulgar Greek; this picture is too darkly coloured; but it would not be easy, in the country of Plato and Democritus, to find a reader, or a copy of their works. The Athenians walk with feline indifference among the glorious ruins of antiquity; and such is the dejection of their character, that they are incapable of admiring the genius of their predecessors." Gibbon's Hist. vol. vi. p. 355. &c. For the modern account of Athens and the Athenians, see Spoon, Voyage on Greece, t. ii. p. 79—199; Wheeler's Travels into Greece, p. 337—414; Stuart and Rivett's Antiquities of Athens, vol. i. ii. and iii. passim; and Chatterer's Travels into Greece, p. 25—172. It is now called Athini, and Stintes; which see.

ATHENIANS, Character and Manners of the. These people were highly susceptible of lively and transient fancies, and, accordingly, they stand distinguished beyond all other nations for uniting the most discordant qualities, and such as were often prevented and made occasions of misleading them. History represents them to us (see the authorities
ties cited in the "Travels of Anacharsis," vol. ii. p. 262.), sometimes as an old dotard, who may be deceived with impurity; or as an infant who requires continual amendment; and sometimes as displaying the discourses and sentiments of elevated minds; as piously fond of pleasure and of liberty, of indulgence and of glory; or intoxicated with flattery, and yet receiving merited reproach with applause; as polluting penetrance to apprehend a word the plans proposed to them, but too impatient to listen to the particulars, or to foresee their consequences; as making their magistrates tremble before them, and at the same moment pardoning their most bitter enemies; as paining with the rapidity of lightning from rage to consolation, from dependence to independence, from injustice to repentance; as beyond conception sicken; and to frivolous, that in the most furious, and even the more desperate situation of their affairs, a single word spoken at random, a happy fallacy of pleading, the smallest object, the most trivial incident, provided it were unexpected, sufficed to dispel their fears, or to divert them from attention to their most important interests. As nothing was more easy than to excite and inflame the passions of such a people, it was equally easy to acquire, and also to lose, their confidence. A popular leader, whilf in favour with them, might without difficulty persuade them, by good or evil measures with an equal degree of ardour. When guided by wise and virtuous men, they bestowed public offices of trust or power on those, who united great abilities with eminent virtue: at other times, they made a choice at which they ought to have blushed; and they were thus frequently the sport of flattering orators and ambitious tyrants. Such, however, was their inherent detestation of tyranny, that they were extremely jealous, on many memorable occasions, of their privileges, and both zealous and active in defence of their liberty, whenever they thought it attacked and violated by men in power. Indeed, an ardent love of liberty was their predominant quality, and the main spring of their government. They left, without hesitation, their cities and their houses, to fight at sea or by land the common enemy, who threatened them with the danger of servitude. It was a glorious day for Athens, when, all her allies yielding to the advantageous offers of the king of Persia, the reply by Ariadne to the ambassadors of that monarch; "that it was impossible for all the gold in the world to tempt the republic of Athens, and to prevail with her to sell her liberty, and that of Greece." By such sentiments, and a conduct actuated by them, the Athenians not only became the bulwark of Greece, but likewise guarded the rest of Europe from a Persian invasion. The Athenians, however, notwithstanding their attachment to the rights of their country, and the jealousy with which they watched over them, were volatile, capricious, and inconstant; and this disposition betrayed them into errors, incompatible with true patriotism. Whilf the Athenians indulged views of conquest that were extensive and ambitious, they were, in private life, and in their domestic arrangements and expenditures, frugal, simple, and unostentatious; but when the honour of the state required it, sumptuous and magnificent. Their conquests, their riches, and their connections with the inhabitants of Asia Minor, never betrayed them into luxury, pomposity, and profusion. Xenophon observes, that a citizen was not distinguished from a slave by his drécs; and it is remarked with approbation by Demolhènes, that in the best times of the republic, the houses of Themistocles and Ariadne could not be distinguished from those of their neighbours. The wealthy citizen, and the most renowned general, were not ashamed to go themselves to market. In the form and disposition of the several articles of dregs, the men were expected to study decency, and the women to unite elegance with taste. The latter, whenever they went out, wore a veil over their heads; and they painted their eye-brows black, and applied to their faces a layer of cerule or white lead, with deep tinge of rouge. Their hair, which they crowned with flowers, was sprinkled over with a yellow-coloured powder. Shut up in their apartments, they never participated in the pleasures of the companies assembled by their husbands. In the day, the law permitted them to go out only on certain occasions, and never in the night time, but in a carriage, and with a flame to light them; but notwithstanding the restraint of this law, the women of the lower classes indulged themselves with greater liberty. In public festivals they were present at the spectacles as well as the ceremonies of the temple; but they were generally attended by youths, or female slaves. At an early period the Athenians were so jealous, that they would not permit their women to show themselves at the window; but this restraint was gradually relaxed, and several laws were introduced to guard against seduction and impiety. (See Adultery.) M. de Pauw, in his "Recherches Philosophiques sur les Grèces," on the authority of Athenæus and Plutarch, represents the Athenian matrons as addicted to drunkenness, and the most delightful festivity; he says that they were turbulent and impetuous, that they were fated to live and die, and that, notwithstanding the restraint of their husbands, domestic peace was very seldom found in their habitations. It is certain, that the feasts of Bacchus, and some other religious institutions which the women claimed a right to celebrate, could not tend to inspire either gentleness of manners or purity of morals. Courtezans were protected at Athens by the laws, but the public manners were contaminated by this licence. Females of this description, however, were not allowed to appear in the streets with rich trinkets or jewels, nor were men in office permitted to appear with them in public. The Athenians were naturally abstemious: their chief food consisted of salt meat and vegetables. The necessaries of the poor were supplied either from the public treasury, or other means. In Athens there were several societies, the members of which entered into a solemn engagement to affix each other in cases of judicial prosecution; and there was one society, whose only object was to observe and collect every species of ridiculous affluence, and to divert itself with pleasures and bon-mots. At Athens, a small number of citizens enriched themselves by commerce, and by silver mines which they possessed at Laurum. Others deemed themselves master of a decent fortune when they possessed clattes to the value of fifteen or twenty talents (the talent being equal to about 2251. sterling), and when they were able to give their daughters a marriage portion of 100 minas, or about 3751. sterling.

The taste of the Athenians for literature and science is well known. The inhabitants of Athens, says Cicero (De Orat. and Orat. pro Flacco), were the inventors of all learning; the men who invented and perfected eloquence, and from whom humanity, learning, religion, and laws were diffused through the whole world; nevertheless, he adds, "they only knew what was right, but would not do it." When the Athenians, says the ingenious Mr. Harris (Philosophical Inquiries, part. iii. c. 3.), had delivered themselves from the tyranny of Pisistratus, and after this had defeated the vast efforts of the Persians under Darius and Xerxes, they may be considered as at the summit of their national glory; and for more than half a century afterwards, they maintained, without control, the sovereignty of Greece. As their taste was naturally good, arts of every kind soon arose among them, and flourished.
Valour had given them reputation; reputation gave them an acendant; and that acendant produced a security, which left their minds at ease, and gave them leisure to cultivate every thing liberal or elegant. It was then that Pericles adorned the city with temples, theatres, and other beautiful public buildings. Phidias, the great sculptor, was employed as his architect, who, when he had erected edifices, adorned them himself, and added statues and baso-relievs, the admiration of every beholder. It was then that Polygnotus and Myro painted; that Sophocles and Euripides wrote; and not long after that they faw the divinity of Socrates. Although their military strength and political sovereignty were impaired by the Lacedaemonians, humiliated by the Thebans under Epaminondas, and wholly crushed by Philip the Macedonian; yet, happily for mankind, their love of literature and arts did not link along with it. Juft at the close of their golden days of empire, flourished Xenophon and Plato, the disciples of Socrates, and from Plato defended that race of philosophers called the "Old Academy," which was succeeded by the "New Academy." (See Academy.) With the study of philosophy was united that of rhetoric, upon which treatises were written by the ablest Greek philosophers. To this object they were incited by the intrinsic beauty of their language, as it was then spoken among the learned and polite. The fame love of elegance which made them attend to their syle, made them attend even to the places where their philosophy was taught. Such was the Academy of Plato; the Lyceum of Aristotle; the portico or colonnade of Zeno, the walls of which were decorated by various paintings of Polygnotus and Myro; and the gardens of Epicurus. These public institutions were called among the Greeks by the name of Gymnasia, in which were taught all those exercises, and all those arts, which tended to cultivate not only the body but the mind. Dr. Gillies, in his, "History of Greece," has dwelt with a degree of enthusiasm on the advantages, both natural and moral, resulting from the gymnastic exercises and public games; but M. de Pauw (ubi supra), differs in opinion, affirring that nothing could be more pernicious, or tend more to eneimate the human race, than these exercises. As to the moral advantages of these public games, it is not very easy to decide: but their physiological effect is much less questionable, and cannot be justly disputed.

Athenæ. Population of. From comparing the several accounts of the population of Attica in the time of Pericles, of Demosthenes, and of Demetrius Phalereus, M. de Pauw (ubi supra) conjectures, that the number of citizens was preferred nearly at the same level, in conféquence of the adoption of strangers, to repair the extraordinary devastations of war and deficiency, and of emigrations, when the number exceeded that which the rules of policy had established; this was 25,000 men; and he supposes that there was an equal number of women. In the time of Demetrius Phalereus, the strangers settled in Attica amounted to 10,000, and the slaves to 400,000; so that the whole number may be estimated at 450,000 to about eighty-six square leagues of territory, or above 5000 on an average to each square league. This, he observes, is a much greater population than that of France, which, according to M. Necker's calculations, contains not more than 900 inhabitants to a square league.

The people of Athens were comprehended under the classes of freemen or citizens, Ἱπατοί; sojourners, or Μελίανθις; and slaves, or Δραμαί. Cecropes distributed them into four φαναρία, or tribes, each tribe being subdivided into three parts, and each of these into thirty families. The names of the tribes were different at different times; and their number was increased by Clitihenes to ten; and they were afterwards augmented to twelve. These tribes had public feasts, at which they met to promote friendship and good neighbourhood. To each tribe belonged several little boroughs in Attica, called Δεαναί; of these there were 174, besides other boroughs that belonged to no particular tribes. It was enacted, that all strangers who intended to live at Athens, should be compelled, after a short residence, to enroll their names among the free citizens, and that none but persons of eminent meritorious character should be citizens. This privilege was conferred by the popular assembly. It was also enacted, that none should reside as free citizens at Athens, except those who were banished from their own country, or who voluntarily settled there with their whole families. They were admitted to their rights by certain ceremonies, and enrolled in a certain tribe. Solon decreed, that none should be accounted free but such as were Athenians both by father and mother: this regulation was revived, after difufs, by Pericles, and at his motion repealed; and after the expulsion of the thirty tyrants, Solon's law was restored. In the Cynoarges there was a court of judicature, to which causes of illegitimacy belonged; and great care was taken that none should be enrolled as citizens, whose title was not examined and proved.

The Μελίανθις, or sojourners, were those who came from foreign country and settled in Attica, being admitted by the council of Areopagus, and publicly registered. Of these, several services were required; and both men and women paid an annual tax. Those who failed to pay it were fined and exposed to sale by the officers of the public revenue: such, according to Diogenes, was the fate of Xenocrates the philosopher; but those who rendered any service to the public, were exempted from the payment of all imposts, except such as were demanded of free citizens. Such penitents as did not constantly reside at Athens, were called νομίζομενοι, or strangers.

The slaves were of two sorts: such as became so from poverty, the chance of war, or the peridy of those who trafficked in them, and who were at liberty to change their masters, and to release themselves from servitude; and such as were at the absolute disposal of their masters. Slaves were not allowed to imitate freemen in their dress and manners. They were forbidden to wear long hair, and what is more astonishing, Solon prohibited them to love boys, as if this practice where honourable: they were not permitted to plead for themselves, or to be witnesses in any cause; confiscation was extorted from them by torture; nor were they allowed to worship certain deities, to be called by honourable names, and to bear arms. They were reduced to obedience, and punished by corporal severities; they were sometimes marked on the forehead, or stigmatized in any other part of the body. Nevertheless they were allowed at Athens to take refuge in the temple of Theseus, when they were oppressed, and it was farcical to force them from it. They were allowed to bring an action against all their masters for ill treatment, and against those who injured them; and in various respects their condition was preferable to that of slaves in other places, as they might purchase their freedom, and were sometimes advanced to the dignity of citizens. In the first day of every month, the merchants called αριστοκράτοι, exposed them for sale in the slave-market. In the time of Adrian, masters were prohibited from putting their slaves to death.

Athenæ. Magistrates and Government of. By the law of Solon no man who had not a good estate, could bear the office of a magistrate; but by the law of Arilides, every man
Athenians was admitted to a share in the commonwealth; but before he was admitted, he was obliged to give an account of his past life before judges in that part of the forum called Scena. It was a capital crime for a person to enter on his office in debt. The magistrates of Athens were of three forts, viz. Xeraphes, who were elected by the people, and so called because chosen by holding up of hands; Kastex, who were promoted by lots drawn by the Thesmophorës, in the temple of Theseus; and Agora, who were extraordinary officers appointed by particular tribes, to superintend public affairs. The magistrates entered on their offices on the first day of the month Hebaton. The first and most important of these magistrates was that of the archons. (See Archon.) Among the inferior magistrates may be reckoned the Nomophylæces, Phylarchi, Phylarchæ, Phylarhochi, Demarchi, Lenarchi, Taxarchi, and Nomotheti, to whom were added the Rhetories, which see respectively. There were other magistrates who had the superintendence and regulation of the general assembly of the people called Ecclesia; such as the Epistates, Prytanes, and Prytaneum. (See also Senate, and Prytanæum.) The courts of justice, exclusive of the Areopagus, were ten in number, of which four had cognizance of criminal, and five of civil causes. These courts were painted with various colours, and on each was engraved one of the ten first letters of the Greek alphabet; and hence they were denominated Alpha, Beta, &c. The names of those who were to hear and determine causes, and the names also of their father and borough, inscribed upon tablets, were delivered to the Thesmophorës, who returned it with another tablet on which was inscribed the letter of one of the courts according to the lots. These tablets were carried to the crier of the several courts directed by the letters, who gave to every man a tablet inscribed with his own name and the name of the court in which he was to sit; and having received a sceptre, the usual ensign of judicial power, they were severally admitted into the court. When their respective caufes were determined, they returned the sceptre to the Prytaneum, from whom they received their due reward, sometimes one obolus, and sometimes three oboli. No man was allowed to fit in more than one court in a day; and if they were convicted of bribery, they were fined. The first criminal court after the Areopagus was that of the Ephes; the second was called Delphinium; the third, Prytaneum; and the last Phratæum; see the respective articles. Of the judiciaries courts for civil causes, the first was the Pyrgus; the second, the Cainoni; the third, Triagon; the fourth, the court of Lycaeus; the fifth, that of Mystichus; and the sixth, Helice. All the Athenians who were free citizens were allowed to sit in these courts as judges; but they were previously obliged to take a solemn oath, by Apollo Patrius, Ceres, and Jupiter the king, that they would pass a just sentence, according to the law, and to the best of their judgment. This oath was administered near the river Ilissus, in a place called "Ardettus" from a person of that name, who, in a public sedition, united the contending parties, and engaged them to confirm their treaties of peace by mutual oaths in this place; whence common swearers were called aridotæ. They were other courts of less consequence, where the deiætæ, or τετραπονοι, or other magistrates, took cognizance of causes belonging to their several offices. Such were the courts at Cynoarges, Odeum, the temple of Theseus, Bucolæum, &c. In the judicial procès, the plaintiff delivered to the magistrate the name of the person against whom he brought his action, with an account of his offence; this was followed by an inquiry on the part of the magistrate, whether it belonged to his cognizance, and whether it ought to be tried, called "Ammonis," the plaintiff then, with petition of the magistrate, summoned his adversary to appear; but if the latter refused to appear, he was dragged by force. When both plaintiff and defendant were before the magistrate, he inquired of the former whether the writers were all ready, which was the second "Ammonis," when no plea was urged on the part of either plaintiff or defendant for setting off the trial, an oath was administered to both parties. These oaths, with those of the witnesses, and other matters relating to the action, were written upon tablets, and deposited in a vessel, which was delivered to the judges. The judges, being appointed by lots, took their places at the aligned day in the tribunal. The magistrate then proposed the cause to them, and gave them authority to determine it. The public criæ read the indictment containing the grounds of the accusation which were noted down by the judges. If the defence did not appear, sentence was immediately passed against him; but if he presented himself within ten days, alleging reasons for his absence, the former sentence was reversed, and the trial was to be brought forward by the defendant within two months; but if it was not brought on, the former sentence was confirmed. Before trial, both parties deposited a sum of money in the hands of the magistrates, who introduced their cause into the court, who, if the money was not paid, carried their cause from the roll. The deposit, which was 3 drachmas for a cause of the value of 100 drachmas to 1000; and 80 for more than 1000 and less than 10,000; was divided among the judges; and the person who lost his cause, restored the money to his adversary, and paid the charges. The witnesses in the trial were to be free-born, and delivering of credit; and they were considered as infamious if they had forfeited their privileges by misconduct. The testimony was sometimes given aloud in open court, and sometimes in writing upon a tablet of wax. If the parties required it, they were allowed advocates, whose speeches were limited as to length of time, measured by a water-glass. When the parties had finished, the crier was commanded by the presiding magistrates, to order the judges to bring in their verdict; and where the law had provided penalties, a verdict of guilty or not guilty was sufficient; but when the laws were silent, another sentence was necessary, determining the punishment due to the offence. When the laws were silent, the judges might limit the punishment; sentence was at first given by black and white sea-shells called καιαυρος, or pebbles called βράτη; half of brats were afterwards used, and then beans; the white beans were whole, and used to acquit; the black were bored through, to condemn. The cause while pending was engraved on a tablet, and expounded to public view, and hung up at the statue of the heroes named Δρηπον. If the person convicted was guilty, he was delivered to the Δρηπον, to receive punishment; but if he was fined, the Τετραπος gave the fine paid; if unable to pay it, he was doomed to perpetual imprisonment. If the plaintiff had unjustly accused his adversary, he was sentenced to suffer that punishment which the law inflicted on the crime with which his adversary was accused. The plaintiff was called δρηπον, the cause itself δρηπον, and the accused δρηπον. Anew was the name of the indictment before conviction, and δρηπον after it. When the trial was closed the judges went to the temple of Lycaeus, returned their tablets, and received their money. The Athenian judgments were of two kinds: public, concerning those crimes that affected the state, called καθαρμια, and all persons were encouraged by law to avenge the public wrong, by bringing the criminal to punishment; and private, concerning all controversies between private persons.
A T H E N S.
called lass; and no one could prosecute an offender except he who was injured, or some of his family. The public judgments were murder, malicious wounding, a confabulation of the city, piracy, conspiracy against the life of another, forde, punished with death, impiety, treason, forgery; whereas, punishable by fine; sedition; refusing to serve in war, and commonwealth with infamy; defection of the fleet and of the army, punished by fine; defer- tion from their poll, as leaving the infantry for the cavalry; refusals in the fleet, or losing their shield, punished with infamy; charging men with debts already paid, punished by fine; an action for false arrest, for beating a free man or reducing him to slavery, assault or frivolous accusation, punished by a fine; receiving bribes for any public affair, or perverting justice, fined ten times the value of what they received, and punished with the greatest degree of in- "famy; for offering bribes for the perversion of justice, and particularly in cases relating to the freedom of the city; for erasing a name out of the public debt-book before the debt was discharged; digging a mine without the public knowledge, a twenty-fourth part of the metal belonging to the public; against magistrates who had neglected to surrender their accounts; for proposing a new law, and acting contrary to the established laws; against magistrates, ambassadors, and other public officers, who had misemployed the public money, or others offended; against ambassadors who had forfeited their trust; against defactious tumultuous persons; an action for debts due to the public, falsely charged upon those who had never paid the fines imposed upon them; for the diffor- vency of any secret injury; and against such as exported corn from Attica, appropriated the public money or land, or for misappropriating the property of orphans; against those who confected their crimes without standing a trial; against those who protected murderers; and against such as had been guilty of certain state-offences. Of private judgments, which were very numerous, the principal were against those who had done an injury punished with fine, an action of assault, a la- wfull generally for the recovery of an estate, a suit concerning relationship, an action of divorce, an action by a master or patron against his clients who were freed slaves, and who re- fused to perform the services incumbent upon them, an ac- tion against fojourners who neglected to chuse a patron, an action of ingratitude, against those who had violated the chastity of women, or injured the persons of men, an action concerning nuisance, against those who would not divide their property among just claimants, for demanding rent, against guardians who had defrauded their wards, of flander, by which the criminal was fined 500 drachmas, against those who had furnished false witnesses, against thieves, an action claiming an estate against those who refused to redote that with which they were entrusted, against those who would not fulfil their contracts, and a suit between debtors and creditors.

The criminal punishments of the Athenians were 18,0001., infamy or disgrace; 2000 drachmas, a deep pit into which condemned perons were cast headlong (See BARATHRUM); 2000 drachmas, or the ignominious punishment of hanging or dragging; 2000 drachmas, the punishment of fetters or imprisonment; death, by which a criminal was reduced to the condition of a slave; 300 drachmas, a peculiar fine laid upon the criminal, according to the nature of his offence; death inflicted for various offences; 2000 drachmas, a precipice from which the malefactor was thrown headlong; 300 drachmas, a collar usually made of wood; 2000 drachmas, laceration, a common punishment for adultery; 500 drachmas, with which the criminal was beheaded; fetters with five holes; 2000 drachmas, a round instrument to confine the hand; a crofs, confining of two beams laid across one another, to which the malefactor was nailed; 3000 drachmas, a pillar, on which the crimes of the offender were engraved; 2000 drachmas, marks impressed with a hot iron upon flaves; 2000 drachmas, or 2000 drachmas, clubs, with which malefactors were beaten to death; 1000 drachmas, small cords, by which criminals were strangled upon the rack; 2000 drachmas, poison, of which various sorts were used, but the most common was the juice of hemlock; 500 drachmas, or banishment, of which there were several sorts: the fetters, in which the legs were fastened; 1000 drachmas, a piece of wood to which the criminal was bound; 1000 drachmas, drowning in the sea; and 500 drachmas, or burning. Public honours and rewards were 5000 drachmas (see ATELLEIA), or an immunity from taxes and other public duties; 1000 drachmas, the honour of a statue erected in any public place; 500 drachmas, or the liberty of the first feasts at public entertainments; 500 drachmas, an entertainment at the public expense, given to those who had deserved well of their country; and 500 drachmas, crowns conferred by the vote of the people in their public assembly, by the senators in council, by the tribes to their own members, and by the demotic in their own deme, or borough.

As to the laws of the Athenians, it was a received opin- ion that they were taught the use of laws by Ceres; but it is certain that Theseus retained the privilege of making and preferring laws. Draco was the next law-giver, and his laws were called 500 drachmas; these were, all except those of murder, repealed by Solon, whose laws were distinguished by the term 500 drachmas. The theomithetes swore to the observance of them, on the penalty of dedicating a statue as large as life to the Delphian Apollo; and the people were bound to obey them for a hundred years. Pilitistratus afterwards allowed for himself, and left to his sons, the authority of a law-giver; but the laws of Solon were in some degree enforced by Chisthenes, who himself added new ones. These continued in force till the Peloponnesian war, when the go- vernment was altered by the four hundred, and afterwards by the thirty tyrants. The ancient laws were again restored by Eucleides, and others by the influence of Diocles, Ari- topphon, and afterwards by Demetrius Phalereus; and these, with Aeschylus and Thales, were the chief legislators of Athens. (Suidas.) The laws were annually revised; and a new law was to be propounded before an old one could be repealed. Solon, and other law-givers who succeeded him, committed their laws to writing. The laws of Solon were engraved on tablets of wood; and some affirm, that the original in his hand-writing were always kept in the citadel, and copies of them in the prytaneeum. The laws were all engraved on the wall in the 500 drachmas, or royal portico, for the inspection of the public. This was the custom after the expulsion of the thirty tyrants.

A T H E N I A N S, Commerce of the. The harbour of Piraeus was much frequented, not only by Grecian vessels, but also by those of the nations which the Greeks denominated Barbarians. But as the Athenians were actuated by the spirit of conquest, and aspired to the sovereignty of the seas, in order to obtain that of the land, they directed their attention to the navy with this view; and therefore their com- merce was restrained to the procuring from other countries the commodities and productions necessary to their subsistence. Nevertheless, the Athenians adopted a variety of regulations, and enacted many laws for extending commerce, and preventing as much as possible the litigations and obstacles which impeded its operations. They inflicted a fine of a thousand drachmas (about 35l. 10s.), and sometimes the punishment of imprisonment, on him who secured a merchant of any crime which he was unable to prove. As Attica produced but little corn, the exportation of it
ATHENS.

was prohibited; and those who fetched it from foreign countries were forbidden, under rigorous penalties, to carry it to any other market but that of Athens. A great quantity was brought from Egypt and Sicily; and a greater quantity from Panticapaeum and Theodolia, cities of the Chersonesus Taurica, because the sovereign of that country, the master of the Cimmerian Bosphorus, exempted the Athenian vessels from paying the duty which he levied on the exportation of that commodity. In consequence of this privilege, they traded in preference to the Cimmerian Bosphorus, from which Athens received annually 400,000 mediumri of corn. The Athenians also imported from Panticapaeum, and the different coasts of the Euxine sea, timber for building, flax, felt, wool, linen, and goat-skins; from Byzantium, and other parts of Thrace and Macedonia, falt-fish and wood; from Phrygia and Miletus, carpets, coverlets for beds, and the fine wool of which they made their cloths; from the islands of the Ægean sea, wines of the various kinds of fruits which they produce; and from Thrace, Thessaly, Phrygia, and many other countries, a great number of flax. Oil was the only commodity which Solon allowed them to exchange for foreign merchandise; the exportation of all other productions from Attica was prohibited; nor was it permitted to carry out of their country, without paying heavy duties, the timber of the fir, the cypresses, the plane, and other trees which grew in the environs of Athens. In their silver mines the Athenians found a great resource for their commerce. As several states debased their coin, the money of Athens, in greater estimation than that of other countries, procured for them an advantageous exchange. In general, they purchased wines in the islands of the Ægean sea, or on the coasts of Thrace; for it was principally by means of this commodity that they trafficked with the people who inhabited the borders of the Euxine sea. The taste conspicuous in the works of their artificers, rendered the productions of their skill and industry desirable; so that they exported to distant countries swords and arms of different kinds, cloths, beds, and various utensils. Books were with them also an article of trade. They maintained correspondents in almost all the places to which they were attracted by the hope of gain; and, on the other hand, many of the states of Greece appointed agents at Athens to superintend the interests of their trade. The Athenians for the most part employed their money in trade; but they were not allowed to lend it in the public markets of Athens. The lender had his fear or on the merchandise or goods of the borrower; and as the dangers of the sea were partly risked by the former, and the profit of the latter might be very considerable, the interest of money thus lent might rise as high as 30 per cent. more or less, according to the length and hazards of the voyage. The landed interest amounted to 12 per cent. per annum, sometimes to 16 per cent. monthly, and among the lower classes of the people, the quarter of the principal was exacted for daily interest. Commerce, by increasing the circulation of wealth, gave rise to the occupation of bankers, and thus its circulation was still more facilitated.

ATHENS, Money of, was of three sorts. Silver was first coined, afterwards gold, and lastly copper. The most common coins were those of silver, and they were of different value. Above the drachma (16d. English), containing of five oboli, was the dirachma, or double drachma, and the tetradrachma, or quadruple drachma; below it were the pieces of 4, 3, and 2 oboli; after which were the obolus and semidrachm (i.e. 6d. 4½d. 3d. 1½d. and 3d. English). The latter being found inconvenient for common use, copper money was coined about the beginning of the Peloponnesian war; and pieces of that metal were struck, which were not worth more than the eighth part of an obolus. The largest piece of gold weighed two drachmas, and was worth twenty silver drachmas (i.e. fifteen shillings English). Gold was very scarce in Greece; it was brought from Lydia and Macedonia, where the peasants collected the small pieces which the rains washed down from the neighbouring mountains. See Money.

ATHENS, Revenues of, sometimes amounted to the sum of 2000 talents or 450,000l. and these revenues were of two kinds; those which were raised in the country itself, and those that were drawn from the tributary cities and states. The first class comprehended the product of the houses, lands, and woods, appertaining to the republic, and farmed out for a certain sum; the twenty-fourth part referred from the silver mines, payable by individuals who had permission to work them; the annual tribute received from freedmen and the 10,000 foreigners settled in Attica; the fines and confiscations, the principal of which went into the treasurY of the state; the fifth, levied on corn and other merchandise imported, and also on several commodities that were exported from the Piraeus; which, during the Peloponnesian war, were farmed at thirty-six talents (8100l.); and a number of other taxes of less importance, yielded by commodities sold in the market, and levied on such as kept counts in their houses. Most of these duties were farmed; and the farmers remitted, before the ninth month of the year, the sum filiipulated to the receivers of the revenue. The second and principal branch of the revenues of the state, consisted in the tributes which were paid by a number of cities and islands dependent upon it. Its claims of this kind were founded on the abuse of power. After the battle of Platae, the conquerors having resolved to revenge on Peria the insults offered to Greece, the inhabitants of the islands who had entered into the league agreed to set apart every year a considerable sum to defray the expenses of the war. The Athenians collected in different places 460 talents (1053,500l.); and by degrees, as their power increased, they changed the gratuitous contributions of the allied cities, into an humiliating exaction, imposing on some the obligation to provide ships whenever they should be called upon, and demanding of others the annual tribute to which they had formerly subjected themselves. In the same manner they taxed their new conquests, and the sum total of the foreign contributions amounted, at the beginning of the Peloponnesian war, to 600 talents (135,000l.); and as the fame of Philip, to two hundred and thirteen hundred. The conquests of Philip reduced this sum to 400 talents, and the Athenians flattered themselves they should again be able to advance it to 1200 (270,000l.).

The 460 talents drawn annually from the states leagues against the Persians, and deposited by the Athenians in the citadel, at first amounted to the sum of 10,000 talents (2,250,000l) according to Iocrates (t. p. 392); or 9700 (2,182,500l.) according to Thucydides (l. ii. c. 12.). Pericles, during his administration, had laid up 8000; but having expended 3700, either in the embellishment of the city, or the expenses of the siege of Potidaea, the 9700 were reduced to 6000 (1,350,000l.) at the beginning of the Peloponnesian war. This war was suspended by a truce, which the Athenians entered into with the Lacedemonians, and the contributions which they had then received amounted to 12 or 1300 talents; and during the seven years of the truce, they placed 7000 talents (1,550,000l.) in the public treasury. These revenues, however considerable, were insufficient to defray the expenses of the state; and recourse was frequently had to free gifts and forced contributions. Of all the branches of public expenditure, the maintenance of the navy was the most heavy; when an armament was to
to be fitted out, each of the ten tribes levied in its district the same number of talents as there were galleys to be equipped, and demanded them from the same number of companies, composed sometimes of sixteen persons liable to contribute. Demosthenes made an amendment in the mode of assessing this tax. The decree proposed by him for this purpose was as follows: every citizen, whose fortune amounted to ten talents, was to furnish the state with one galley; if he poissessed twenty talents, with two; and however rich he might be, no more should be required of him than three galleys and a halllop. Tho whole substance was less than ten talents were to join in contributing a galley.

Atar. Religion of. From the earliest times the objects of religious worship multiplied among the Athenians. They received the twelve principal divinities from the Egyptians, and others from the Libyans and different nations; and they were so fearful of omitting religious worship, that they even erected altars to the unknown God. (Paulus, in Attic.) See Aths. In process of time a law was enacted, prohibiting, under pain of death, the introduction of any foreign worship, without a decree of the aereopagus. It was an ancient practice, to consecrate, by monuments and festivals, the memory of kings, and other distinguished persons, who had rendered essential service to their country, or to mankind. To this class the Athenians referred Thetis, Erectheus, such as desired to have their names approached to the ten tribes; and many others, as Hercules, &c. But the worship of the latter differed from that of the gods, in the ceremonies that accompanied it, as well as in the object to which it was directed. Before the deity they prostrated themselves, imporing his protection, thanking him for his bounties, and acknowledging their dependence. In honour of the heroes, and as a memorial of their illustrious deeds, they consecrated temples, idols, and groves, and celebrated festivals and games. Incense was burnt on their altars, and libations were poured over their tombs to procure repose to their manes. The religion of the common people entirely consisted in prayers, sacrifices, and purifications. Individuals presented their prayers to the gods at the commencement of any undertaking; and they offered up their addresses in the morning, the evening, at the rising and setting of the sun and moon. Sometimes they repaired to the temple with downcast eyes and dejected countenances; they kissed the ground, offered their prayers kneeling, on their knees, and prostrate, and held branches in their hands, which they lifted up towards heaven, or flung out towards the statue of the god, after applying it to their mouths. In addressing the infernal deities, they struck the earth with their feet or hands. Some pronounced their devout addresses in a low voice; but Pythagoras wished them always to be uttered aloud, that nothing might be asked which could excite a blush. At the feaons of worship, the space before the temple, and the porticoes that surrounded it, were full of people; so jollily has the apostle Paul characterized the Athenians, when he called them (Acts, xvii. 22.), "Melissae, "too superfluous," as the common translation renders it, or perhaps as it might be rendered less officiously and more conformably to the conciliatory address, which the apostle would have used on such an occasion, and also to the frequent use of the term, "very devout." See Lardner's Works, vol. i. p. 193. The priests were the principal ministers of religion; and they were next in precedence to the kings and chief magistrates. They obtained their office by inheritance, sometimes by lot, by the appointment of the prince, or by popular election; and they were required to be unimpeached in body, chaste and uncontaminated by the pleasures of the world in their disposition and character, and in their habits devoted to retire ment and piety. Of these priests there were several orders, and among them there was one, denominated Athenai, high priest, who had the superintendence of the rite. Some temples were served by priests only, particularly that of Bacchus in the quarter of the marines. The revenues assigned for the maintenance of the priests and temples were derived from different sources, as a certain part of the produce of penalties and confiscations, and of the spoils taken from the enemy, and the offerings of individuals. They formed, however, no separate and independent body; nor had the ministers of different temples any common interest; and in crimes which respected them personally, they were amenable to the ordinary tribunals. Functions of inferior facility, that related to the service of the temple, were intrusted to lay officers; some of whom were guardians of the treasury, and others appointed as witnesses and inspectors at solemn sacrifices. Next to the priests, were the lexicographers and interpreters of omens. The worship of the Athenians was originally performed in the open air, upon the tops of mountains; and on the lips of temples were afterwards erected, and dedicated to Jupiter, Apollo, and the other gods. Their altars were, also, constructed of various materials, and of different dimensions, according to the variety of gods to whom they were consecrated. Both temples and altars were places of refuge, or asylum, for malefactors and criminals, on all descriptions; and it was deemed an act of favor to force them from their sanctuary. See Asylum. Their sacrifices were also of various kinds, as to their object and design, the materials of which they consisted, and the places in which they were offered, and the ceremonies that attended them. (See Sacrifices.) As public worship was prescribed by one of the fundamental laws, and therefore closely connected with the constitution, it was impossible to attack religion, without endangering that constitution. It was consequently the duty of the magistrates to maintain it, and to oppose all innovations visibly tending to its destruction. Hence the poet Hesiodus was accused of having, in one of his tragedies, revealed the doctrine of the mysteries; Diogoras, under a similar charge, saved himself by flight; Protagoras was criminally prosecuted, and obliged to fly; Procles of Cees was condemned to drink poison; Anaxagoras was imprisoned, and his life was preferred by the interpolation and influence of Pericles; and the life of Alcibiades was endangered by a charge of his having been concerned in the mutilation of the statues of Mercury. See each of these biographical articles.

Athen, in Geography, a township of America, in Windham county, Vermont, thirty-two miles north-east from Bennington, and about six west from Connecticut river, having 450 inhabitants.

Athen, in the state of Ohio and county of Washington, lies on the great Ohio river, 46 miles by water from the Ohio, in the election district of Middletown. This settlement, which commenced in 1797, is in a healthy situation; and the town, which is seated on elevated ground of easy ascent, is abundantly supplied with springs of excellent water. The adjacent country is deemed superior to any in the state for pleasaunts and fertility. An act passed in 1801 for establishing an university in this town, which is called "The Ohio University," and endowed with two townships of land, amounting to 46,060 acres, within which the town of Athens is situated.

Atherdee. See Ardee.

Atherina, or Atherrine, in Ichthyology, one of the Linnaean genera of abdominal fishes; and distinguished by having the upper jaw rather flat, six rays in the gill-membrane, and a silvery stripe on each side of the body. Gmelin
ATHINNIODES, a species of Clupea, distinguished from the other fishes of the same genus by having a silvery lateral line. Gmelin observes, that this fish from its broad silvery line appears to belong to the genus Atherina; but having a compressed body, and small ventral fins, approaches nearer to the Clupea genus, in which he places it. This kind is a native of Surinam.

In the dorsal fin are twelve rays; fourteen in the pectoral fins; eight in the ventral fins; thirty-two in the anal fin; and eighteen in the tail.

ATHEROMA, in Surgery, is a soft, pulvaceous, uninflamed tumour, generally contained within a cyst, or membranous bag. The cure of this swelling consists in its removal with a scalpel. See Tumour, and Exstirpation.

ATHERTON, in Geography, a market town in the county of Warwick, situated upon the Watling Street way, confining principally of one long street, excepting two small avenues or streets on the north side leading to the marketplace and the chapel, the mother church being at Manecett, now a small village about a mile to the south, on the road leading to Coventry. The liberty is bounded on the north by the river Anker, which separates it from Leicestershire. The market is on Tuesday. The trade consists principally in the hat manufacture, wool-combers, ribbon-weavers, and the cotton trade has been likewise lately introduced. It contains about 2650 inhabitants. Distance from London 108 miles.

ATHESIN. See Adige.

ATHIAS, in Biography, a Jew, was a famous printer of Amsterdam, in the seventeenth century; and in 1661, and 1667, he printed two editions of the Hebrew Bible, in two volumes 8vo., for which he obtained of the States-general an honorary remuneration of a medal, and a chain of gold. He also printed the Bible in Spanish, German, and English. He died in 1700. D.It. Hist.

ATHIE, in Geography, a town of France, in the department of the Somme, and chief place of a canton in the district of Peronne, two leagues S.S.E. of Peronne.

ATHINI, or Setines, the modern Athens, is not inconsiderable, says Chandler (Travels in Greece), either in extent, or in the number of its inhabitants. It enjoys a fine temperature, and a serene sky; the air is clear and wholesome. The town stands beneath the acropolis or citadel, and does not encompass the rock as it formerly did, but spreads into the plain, chiefly on the west or north-west. The houses are mostly mean and straggling, with many large areas or courts before them. The water is conveyed to them in channels from mount Hymettus, and in the market-place is a large fountain. The Turks have several mosques, and public baths. The Greeks have convents for men and women, with many churches, in which service is regularly performed, and oratories, or chapels, frequented on the anniversaries of the saints to whom they are dedicated. Besides the more able antiquaries, of which some notice has been taken under Athens, there are many detached pieces that have been found in the town, near the fountain, and also in the streets, the walls, the houses, and the churches. Among these are fragments of sculpture, a marble chair or two, which probably belonged to the gymnasium or theatres, a fun-dial at the catholicon or cathedral, inscribed, as it is said, with the name of Euclid; and at the archiepiscopal house, a curious vessel of marble, used as a cistern for receiving water, but once, probably, serving as a public standard or measure. Many columns, mained statues, and pedestals, are scattered about; and also a fine mutilated Herma. The acropolis, or citadel, is now a fortress, with a thick irregular wall, standing on the brink of precipices, and including a large area, about twice as long as broad. Some portions of the ancient wall remain, and it is repaired with patches of pieces of columns, and with marbles taken from the ruins. The site contains of a few Turks, who reside there with their families, and are called by the Greeks "Cafrians," or followers of the cufle. Their houses overlook the city, plain, and gulf; but the situation is as pleasant as pleasant; the rock is lofty, abrupt, and inaccessible, except the front, which is towards the Piræus; and on that quarter is a mountainous ridge, within cannon shot. The acropolis furnished, says Chandler, an ample field to the ancient virtuosi. It was filled with monuments of ancient glory, and exhibited an amazing display of beauty, of opulence, and of art; each contending, as it were, for the superiority. Heliodorus, named Periegetes or the guide, employed in this place fifteen books. Poleno Periegetes, four volumes; and Strabo, in the Augustan age, affirms, that as many would be required in treating of other portions of Athens and of Attica. The number of statues, in particular, was prodigious. Tiberius Nero, who was fond of images, plundered the acropolis, as well as Delphi and Olympia; and yet Athens, and each of these places, had not fewer than 3000 remaining in the time of Pliny. This banquet of the fesves, continues this traveller, has long been withdrawn; and is now become like the tale of vifion. The spectator views with concern the marble ruins intermixed with mean flat-roofed cottages, and extent amid rubbish; the fad memorials of a nobler people. The antiquities of this city have been also described by Wheeler and Spou, who visited it in the time of Charles II.; and by Mr. le Roy and many others. Mr. Stuart, however, who resided there between three and four years, has amplified others in the accuracy and elegance of his plans and of his description. Spou, in speaking of Athens, says, that the road near Athens was pleasing, and the very peafants pafsible. Wheeler, his fellow-traveller, speaking of the civilization of the Athenians, obferves, that even the fepherdts bid them welcome, and withfoned them a good journey; and that their bad fortune had not been able to deprive them of that bjectivity of wiff which they poifefed by nature; and that, notwithstanding the barbarism that hath long prevailed, they feem to be much more poifefed in their manners and convefation than any others in those places. Stuart confirms, with regard to the prefent Athenians, the account given by Spou and Wheeler of their anceffors; as he found among them the fame addrefs, and the fame natural acumen, though feverely curbed by their defpotic masters. At their convivial meetings, it was a frequent custom for one of them to take a lyre, or a species of guitar, and after a short prelude on the instrument, to accompany the instrumental music with his voice; suddenly chanting some extempe verses, feldom exceeding two or three diflches; this performer delivered the lyre to his neighbour; who, after he has done, delivers it to another; and thus the instrument circulated, till it had passed round the table. He adds, that, notwithstanding the various fortune of Athens as a city, Attica was still famous for olives, and mount Hymettus for honey. Thus "human fulflations perib, but nature is permanent."

The prefent Athens, Athini, or Setines, is the capital of Lивadia, a province of European Turkey, the fee of an archbishop; and contains, as some fay, 15,000, or, according to others, 15 or 16,000 inhabitants, chiefly Greeks. The chief articles of trade are flax, wax, wool, and oil. It is a fea-port, and Situated on the north-east coast of the gulf of Engia in the archipelago, with a fado and large harbour, narrow at the entrance, and commanded by the citadel. N. lat. 38° 5'. E. long. 23° 57'.

ATHIS, a town of France, in the department of the

Orne,
Orne, and chief place of a canton in the district of Domfront; thirteen miles south-west of Falaise. The place contains 33,512, and the canton 15,877, inhabitants: the territory includes 185 kilometres and 20 communes.

Ath, in Ancient Geography, a town of Alba, situated on the western bank of the Euphrates, south-west of Nisopolis.

Athlet, E, in Antiquity, persons of strength and agility, disciplined to perform in the public games. The word is formed from ἀθλος, certamen, combat; whence also ἀθλος, the prize, or reward, adjudged to the victor.

Under athletes were comprehensive wrestlers, boxers, runners, leapers, throwers of the disk, and those practiced in other exercises exhibited in the Olympic, Pythian, and other solemn sports; for the conquerors in which there were established prizes.

From the five usual exercises, the athletes were also distinguished, by and the Latin quinturtiones; at least such as professed them all.

Those who were designed for this profession, frequented the gymnasia or palestra from their youth; and they were obliged to submit to the most strict discipline and abstemious regimen. Their fare was coarse and scanty; they were prohibited the use of wine, and enjoined continence; and thus Horace (Art. Post. v. 412.) describes them:

"Oui fluitat optatan curiu contingere metam, 
Multa tuit et fugitique puer; ludavit et alit; 
Abstinens evocatut est in vesta.

"The apostle Paul, in his first epistle to the Corinthians (ch. i. 25.) enforced temperance by an allusion to the athletes; and Tertullian encourages the martyrs by the same reference. But when the privilege of being supported at the public expense, was granted to such of the athletes as were victorious, they abandoned their habits of abstinence and exercise, and indulged themselves to a very shameful degree of indolence and of gluttony. Before their exercises, their bodies were rubbed with oils and various unguents, in order to render them supple and vigorous; and they practised a kind of noviciate in the gymnasia for several months, that by previous application and practice they might be fitted for the contests in which they engaged. At first they made use of a belt, with an apron annexed to it, for the sake of decency; but they afterwards laid aside this covering, and engaged in several of the combats naked.

To this insult on public decency, some of the belter writers of antiquity have attributed that infamous passion, to the indulgence of which the Greeks were notoriously addicted. The women, indeed, were prohibited from approaching the places where these public games were celebrated. Before they were admitted to the combat, they were examined as to their birth, for none but Greeks were admitted; as to their condition, which was required to be free; and as to their manners, which were to be irreproachable. The name and country of each champion were registered, and a herald, before the commencement of the contest, proclaimed their names. They solemnly vowed not to employ any unfair means, and to conform to the established regulations by which the games were conducted.

Athletic Habit denotes a strong build constitution of body, which was the object the athlete aimed at, and to which their diet corresponded.

Athletic Weight. See Weight.

Athlone, in Geography, the most considerable town of the county of Westmeath, in Ireland, situated on the river Shannon, over which it has a long bridge of many arches, so that it was formerly an important post into the western province. It is partly in the county of Roscommon, and is the most central town in the island. Notwithstanding its advantageous situation for trade and improvement, it is said to be in many parts a poor, ruinous, dirty looking place. The bridge, which was on the Roscommon side, called the Irind town, was built by king John, on a high raised round hill resembling a Danish rath or fort, so as to command the bridge and the adjacent country. This was long the residence of the lord-presidents of Connought, who held in it their courts of justice. In the time of the civil war, it was strongly fortified on both sides of the river; and the English under the lord-president stood a long siege in the castle, in 1641 and 1642. During the whole of this melancholy period, it was a place of great strength and importance, generally in the possession of the Irish or Catholic party; till, in 1651 it was taken by the Charles Coote, at the head of the parliamentary forces. After the defeat of James the Second at the Boyne, his adherents remained at Athlone, and having destroyed the English town which was east of the Shannon, and broken the bridge, resolved to maintain the Irish district on the west. For this purpose they strongly entrenched themselves; and in the following year, the general St. Ruth took his station with the main army behind the town. The English, under Ginkel, succeeded however in passing the river after many unsuccessful attempts, and by a surplusing effort of valour got possession of the town and castle, which was in great measure to be attributed to the carelessness and confidence of St. Ruth, the French general. General Ginkel received a title of the town, which is still enjoyed by his descendants.

Athlone, in Geography, the most northern dioclet of Perthshire, in Scotland; extending about 43 miles in length, and 30 in breadth, and bounded on the north by Baderoch, on the west by Lochaber, on the east and south-east by Mor and Gowrie, on the south by Strathearn and Perth proper, and on the south-west by Braithalane. It is mountainous, and contains part of the ancient Caledonian forest; but the mountains are interfaced with fruitful valleys. It has several villages, but no towns of any importance. The most famous places are Blair castle, seated on the river Tilt, near its influx into the Gurry, an agreeable stream that flows into the Tay, and belonging to the duke of Athol, whose title is derived from the district; and the pass of Gilcrosky, memorable on account of the battle fought here in the beginning of king William's reign, between his general M'Kay, and the highlanders who adhered to king James.

Athol, a township of America, in Worcestershire county, Massachusetts, comprising 16,000 acres of rocky land, and watered with streams and rivers, and containing 848 habitants; 35 miles N.W. from Worcester, and 72 from Boston.

Athos, in Mythology, the name of one of the most ancient deities of Egypt; signifying in the Coptic language, "night." By this name the priests did not originally mean to denote the obscurity which is occasioned...
flowed by the disappearance of the sun, but the darkness which overspread chaos previously to the creation, and from which the Almighty Creator called forth into an habitable world the material universe. This mysterious night was in their opinion the origin of things. Orpheus, initiated in the mysteries of the Egyptians, communicated them to the Greeks, and recommended them by the harmony of his verses. Paulusanas, when he visited Greece, saw at Megara "the oracle of the night," where every thing was taught that related to Athos. This sympathy of deity, by which the Egyptians characterized the principle of things, became, in the language of the Greek philosophers, the "Venus Celestis," or the mother of the world. Orpheus taught them this part of their theology in his hymn to the night, where he says, "I shall sing the night, mother of gods and men, the origin of the creation, whom we shall call Venus." The poets soon took possession of this metaphysical idea, and as they must have a deity for embellishing their poems, they made her spring from the froth of the sea, and represented her as animating the world, and giving life to every thing that breathed. See Ovid, Fastalia, i. iv. 91, and Lucan, De Filis, i. l. c. 21. The Egyptian priests, who had painted night as a divinity, appraised that the moon of the vulgar reposed in the hollow of the heart, and that the sun, having entered into the moon, the planet of the night, and the moon was represented by the cow, whose horns exhibited, as their imagination suggested, her first phases. The philosophers farther extended this doctrine; and they believed the name of night, Athor, and Venus, on the period during which the sun, having passed the equator, remains in the southern hemisphere, when the days are shortest and the nights longest. See Macrobius, l. i. c. 21. The following passage from Plutarch (De Irida, &c.) proves that this opinion originated in Egypt: "In the month of Athyr (the third month of the Egyptian year), the Egyptians say that Oiors (or the sun), is dead. Then the nights become longer, the darkness increases, and the force of the light is diminished. On this occasion, the priests perform mournful ceremonies. They expel to the people a gilded ox covered with a black veil, in token of the grief of the goddess Isis (or the moon); for in Egypt the ox is the symbol of Oiors, and of the earth." Athor had temples in Egypt. Herodotus mentions "Athor-Beki," the city of Athor, which Strabo (l. 17.) and Diodorus (l. 1.) render by the name of Aphrodopolis, the city of Venus. Aelian (De Anim. l. ii. c. 27.) speaking of Chufus, a town of the Hermopolitan nome, says, that in this town they worship Venus; and that a peculiar worship was also paid to the cow. He also informs us, that Isis, or the moon, was represented by the horns of the cow. Jablonowski, Pantheon, Ath. vol. 1. Savary's Letters, vol. ii. p. 354—360.

ATHOS, in Geography, a famous mountain of Greece, in the Chalilian region of Macedonia, seated on a peninsula, the coasts of which form the Sinus Strymonicus, or gulf of Cones, and the Sinus Singiticus, or gulf of Monte Sancy, and joined to the land by an island about twelve leagues broad. The circuit of this peninsula, and of the base of mount Athos, is commonly reckoned to contain about forty leagues. N. lat. 40° 10'. E. long. 24° 45'. This mountain consists of a chain of eminences or summits, seven or eight leagues long, and three or four broad, one of which attracts particular attention on account of its height and habitations, and is denominated Athos Agioforos or the holy mountain, and Monte Sancy. Of its elevation very extravagant and incredible accounts have been given by some ancient writers. Mela reports, that it is so high as to reach above the clouds. Martialis Capellus affirmed that it was six miles high; and it was believed that no rain fell upon it, as the ashes left on the altars erected near its summit remained dry and undiffiger. Plutarch and Pliny have asserted, that it projected its shadow, at the summer solstice, on the market-place of Myrina, the principal city of the island Lemnos. On this account, it is laid the inhabitants of the city erected a brazen cow at the termination of the shadow, on which was inscribed this verse:

"Athos habet montem, Lemnos opem festinans." "Half Lemnos calls Athos its shadow hide." According to Pliny, the distance between the foot of mount Athos and the island of Lemnos was 87000 paces; and according to Belon (Obser. l. c. 25.), eight leagues. The Greeks, struck with the singular situation and towering ascent of this mountain, erected upon it so many churches, monasteries, and hermitages, that it became almost wholly inhabited by devotees; and this circumstance gave occasion to its being denominated the holy mountain; which it still retains, though many of the consecrated buildings are decayed. Among modern travellers, there is a considerable difference of opinion about its height; some make it thirty miles in circumference, and two in perpendicular elevation; and add, that it may have been traversed in three days, and seen at the distance of ninety miles; others state the altitude of its conical summit at 3500 feet. The cold on its summit is extreme; nevertheless it abounds with many different kinds of plants and trees, particularly the pine and fir, and it supplies a multitude of springs and fountains. Its variety of monasteries and churches gives it a picturesque appearance. It is now inhabited by Calyons, a sort of Greek monks, of the order of St. Basil, who never marry, and fare hardly, as they abstain from flesh, and fulfill chiefly on olives picked when they are ripe. Their number is reckoned about 6000, and they inhabit several parts of the mountain, on which are twenty-four monasteries, raised to the height of five or six stories, and surrounded with high walls, flanked with towers, and guarded with artillery against the assaults of banditti and robbers. They are much respected by the Turks, and receive alms from them. They have the character of being very indulgent, and they clothe themselves like hermits. They had formerly several valuable Greek manuscripts, and employed themselves in writing copies of the Greek Testament (see Alexandrian Manuscripts), but they are now become so illiterate, that they can scarcely read or write. As the sea on this coast is very tempestuous, and the Perian fleet had suffered shipwreck in doubling this promontory, Xerxes is said, for preventing a similar disaster, to have cut a passage through the mountain of sufficient width to admit two galleys, with three banks of oars each, to pass in front of, by these means he lowered from the continent the cities of Dion, Olympius, Acrathos, Thyssus, and Cleone. Before he began his works, he is said to have written a letter, addressed to the mountain, in the following terms: "Athos, thou proud and aspiring mountain, that liftest up thy head to the skies, I advise thee not to be too audacious, as to put rocks and stones in the way of my workmen; if thou thus opposest me, I will cut thee entirely down, and throw thee headlong into the sea." Modern travellers inform us, that they perceive no traces of this work: and many of them are of Juvenal's opinion: "Perforatus Athos, et quicquid Graecia mendax
Audet in historia." Dinocrates, an architect in the suit of Alexander, proposed to his conqueror to perpetuate his memory by forming
A THY, in Geography, a town of the county of Kildare, near the borders of the Queen's county, 32 miles from Dublin, at which the affize are held alternately with Naas. It is situated on the River Barrow, which is navigable hence to the sea, and which a branch of the grand canal from Dublin to the Shannon meets at this town. It was founded in the twelfth century, on account of a ford over the river; and became of importance as a place, and sometimes as a frontier town of the English pale, in the difficulties which harassed the country for many centuries, whilst the old towns of Ardree and Ardfeull in its neighbourhood gradually decayed; and the position of either can now only be ascertained from a Danish rath, and some ruins. It was early granted the immunities of a merchant or market town, being mentioned as such in a statute of Henry VI.; and it was made a borough by James I. in 1615, in consequence of which two members were returned to parliament. It is six miles long and five miles broad, and contains 2729 houses, of which 160 were slated and built of lime and stone, and 500 thatched cabins; the population of which might be estimated at about 3500. There were at that time no manufactories which deferred the name, notwithstanding the advantages derived from the canal; and the unhappy state of that part of the country since gives too much reason to suppose that no improvement has yet taken place. The exports from the neighbouring country to Dublin, by the canal, consisted of coals, corn, flour, butter, and potatoes, to the amount of above 20,000 pounds per annum. N. lat. 52° 59'. W. long. 7° 1'. Anthology, Hibern. vol. i. Dr. Beamont's Map and Memoir.

ATHYNA, a small town of Hungary, in Scronia province; sixty miles from Poders, beyond the Drave.

ATH, or AT, a small canto of Africa, in Guinea, upon the Golden Coast, north of Taffin, and to the call of Abrahame.

ATII, See Odogo, or A TII.

ATIBAR, a name given by the inhabitants of the kingdom of Gago, in Africa, to gold-duff; from which word the Europeans, and specially the French, have compos'd the word tiber, which also signifies gold-duff among those who trade in that commodity.

ATICHY, in Geography, a town of France, in the department of the Orne, on the right bank of the river Caston, in the district of Norty, eight miles easterly of Compiegna.

ATICK-GOM-ASHISH, in Ornithology, the name by which the species of Locusta hudsonicus is known in Hudson's bay. Latham, Sowerby, in his "Additions à l'Histoire Naturelle de Buffon," adopts the first part of this long denomination, Atick, as the name of this species. See Hudsonica LOCUSTA.

ATIENCA, in Geography, a town of Spain, in Old Castile, at a small distance from the mountains called "Sierra de Atienza," between Siguenza and Berga d'Oliana.

ATIMIA, infamy or disgrace, in Antiquity, a punishment among the Athenians, inflicted for various crimes. A person suffered this punishment, when, retaining his property, he was deprived of some privilege, enjoyed in common with other citizens: and also, when he suffered a temporary deprivation of the privilege of free citizens, and his goods were confiscated. Those who were indicted to the public treasury, till their debts were paid, incurred this penalty. Also, when the criminal and his posterity were deprived of every right of a free citizen. This was incurred by those that were guilty of theft or perjury, or other similar offences. Infamous persons were not allowed to give evidence.

ATINGA, in Ichthyology, a species of Diodon, of an oblong form, and becket with rounded spines. Gmelin, Ac. in Nat. Ad. Fr. It is described as 'oration diodon corpore spinis unique armato; and in Ameon, Ac. 'oration conico-oblongus, sculpis unique longis retortiformibus, in primis in lateribus. It is called Maregravia guamajacu atinga, and is Poutingus, or paif u crom of French writers. In England it is known by the name of percussion fish.

This species lives in the American seas, and about the cape of Good Hope; and keeps the shores for the sake of its food, which consists of crabs and theacoccus verna or shell-fish. The length rather exceeds twelve inches; the body is compressed at the sides, and blunt; the back rather broad, round, and dusky; belly broad, long, white, and spotted all over with black. The head is hard, broad above, and rather compressed on the sides; eyes large, iris yellow; mouth small and straight; tail long, yellow, rather longer, and angular in the middle; fin yellow, spotted with black; margin brownish, and the rays rampant. This creature has the power of dilating its body, and erecting its spines at pleasure. It is usually taken in nets, but will also take bait, which is commonly the tail of a crab, fastened on the hook. The flesh is edible; but if the relation of Pifo may be depended upon, it should be prepared for the table with the utmost caution; he tells us that the gall is very poisonous, and that should the flesh become impregnated with it (which must be the case if the gall-bladder burst in gutting of the fish), the most dangerous consequences might ensue to those who eat of it; the feaces of the afflicted persons fail, their limbs become languid, and their tongue trembles, cold fits succeed, and in this state they die, unless some speedy remedy be applied.

Gmelin deems diodon holocanthus scalaei capitis colloquie longioribus of Lin. Syph. Nat. and his description of Willoughby, to be a variety of the preceding species; it is distinguished by having the spines of the head and neck longer than in the other.

ATINGACU CAMUCU, in Ornithology, the name affirmed by Maregrava in "The history of Brail," Rays, Willoughby,
ATHINKS, in Geography, the defendant of a good family at Thirleigh, in Gloucestershire, finished his education at Balliol college in Oxford. From thence he removed to Lincoln’s Inn and, after a short interval, during which he travelled into France, he became an accomplished lawyer. In the civil war, he joined the king’s party, and was a considerable sufferer. After the restoration, he was appointed one of the deputy benovent of the county of Gloucester. But being imprisoned in the Marshalsea gaol of Southwark for debt, he died there in 1677. He was the author of several pieces; and particularly of a treatise

"Of the original and growth of Printing," in which he gives an extract from an old MS. chronicle, said to be preserved in the palace of the archbishop at Lambeth, containing an historical account of the invention of this valuable art in this country. The authority of this chronicle has been much disputed by Mr. Palmer, in his "General History of Printing," and also by Dr. Middleton; and vindicated by Mr. Bowyer, in the notes to his abridgment of Dr. Middleton’s "Dissertations upon the origin of printing in England." See Printing.

ATKINSON, in Geography, a township of America, in Rockingham county, New Hampshire, incorporated in 1767, and containing, in the year 1790, 479 inhabitants. It is distant from Portsmouth thirty miles, and has an academy, founded in 1789 by the hon. N. Peabody, and endowed with 1000 acres of land.

ATKYNES, Sir Robert, in Biography, an eminent and patriotic English lawyer, descended of an ancient family in Gloucestershire, and born in 1621, was the son of Sir Edward Atkyns, one of the barons of the exchequer. Having finished his academical course of education at Balliol college, Oxford, and entered for the study of law at Lincoln’s Inn, he afterwards became eminent in his profession. Distinguished by his professional reputation and his loyalty, he was soon after the restoration created a knight of the bath, and in 1672 appointed one of the judges of the court of common pleas. In 1679, defeated by the arbitrary measures of the exiling government, he resigned his poht and retired into the country. On occasion of the trial of Lord William Russell, he gave his advice, and afterwards wrote free remarks on this subject. He then avowed the maxim, "that there neither is, nor ought to be, constructive treason; it defeats the very scope and design of the statute 25 Edw. III. which is to make a plain declaration what shall be adjudged treason by the ordinary courts of justice." His argument in favofir William Williams, speaker of the commons’ house of parliament, who was prosecuted by the crown for signing an order for the printing of Dangerfield’s narrative concerning the papish plot, was afterward quoted under the title of "The power, jurisdiction, and privilege of parliament, and the antiquity of the house of commons affected." In the reign of James II. his attachment to the constitution was manifested by an argument on the case of Sir Edward Hales, which was printed under the title of "An Inquiry into the Power of dispensing with Peal Statutes." The doctrine of dispensations was further diffused in his "Dissertation concerning the ecclesiastical jurisdiction in the realm of England." After the accession of King William III. this friend to the revolution was appointed, in 1689, lord chief baron of the exchequer. He then wrote two pieces in defence of the memory of Lord Russell, whose attainder was reverted by parliament. In 1689, he was advanced to the office of speaker of the house of lords, and retained it till the year 1693. The last public act of his life was his memorable speech addresed to Sir William Amhurst, lord mayor of London, on occasion of his being sworn into his office, in October 1693. This speech, referring to the alarming projects of Louis XIV. and the designs of Charles II., and to establish absolute power, and to introduce popery, was very favourably received; it passed through several editions, and was thought to have been eminently serviceable to the government. In 1695, he resigned his offices, and retired to his seat in Gloucestershire, where he died in 1709, at the age of 88 years. He was a man of great probity, as well as of great skill in his profession; and a warm friend to the constitution, which he was ready to maintain against all opponents. "In whatever view we consider him," says his biographer, "in his private, or in his public station; as a gentleman, or as a judge; as an eminent lawyer, or a distinguished patriot; as a flatelman, or an author; we shall find nothing but what is great and valuable, worthy of love and esteem, and of that veneration which is due to virtuous men from posterity." Besides his valuable "Tracts," which were collected and published in one volume, he is said to have been the author of a treatise against the exorbitant power of the court of chancery.

Biog. Brit.

His only son, Sir Robert Atkyns, who was born in 1646, and died in 1711, differed from his father in his opinions, but inherited his prudence and probity, and was equally esteemed and beloved by men of all parties. As he preferred the character of a country gentleman, he is chiefly known as the author of a topographical work, intituled "The ancient and present State of Gloucestershire," which was published after his death respect of the general manuscript work was delivered by a friend in the printer’s warehouse, so that those which remained became scarce and dear.

Biog. Brit.

ATLANTA, in Ancient Geography, a town of Greece, in the country of the Locrians, destroyed by an earthquake before the birth of Plato.

ATLANTES, a people of ancient Libya, of whom no record now remains but the name.

ATLANTIC Ocean, in Geography, a name given to the sea which separates Europe and Africa on the east from America to the west. Mr. Kirwan, conceiving that at the time of the deluge the water of the great southern ocean below the equator, rushed on the northern hemisphere, describes...
ATLANTIDES, in Astronomia, a denomination given to the Pleiades, or seven stars, sometimes also called virgins. They are thus called, as being supposed by the poets to have been the daughters either of Atlas, or his brother Hesperus, who were translated into heaven. See 

ATLANTIS, in Antiquity, an island spoken of by Plato, and many other writers, under some extraordinary circumstances; and rendered famous by a controversy among the moderns, concerning its place and existence. The Atlantis took its name from Atlas, Neptune's eldest son, who, they tell us, succeeded his father in the government of it. The most distinct account of this celebrated country is given us in Plato's Timaeus and Critias; which amounts, in a few words, to what follows. "The Atlantis was a large island in the Western ocean, situate before, or opposite to, the straits of Gades. Out of this island there was an easy passage into some others, which lay near a large continent, exceeding all Libya and Asia. Neptune settled in this island, which he distributed among his ten sons; to the youngest fell the extremity of the island called Gadira, which in the language of the country signifies fertile, or abundant in fish. The descendants of Neptune reigned here from father to son, for a great number of generations, in the order of primogeniture, during the space of 9000 years. They also possessed several other islands, and passing into Europe and Africa, subdued all Libya as far as Egypt, and all Europe to Asia Minor. At length the island sunk under water; and, for a long time afterwards, the sea throughout was full of flats and shelves." This island was 30,000 stadia in length, and 2000 in breadth; it was in a very high degree fertile and productive, abounding with pasture and arable, and in metals and trees. The northern part of it had various mountains, which were stoned with villages and magnificent habitations. The inhabitants were numerous and powerful, and distinguished both by arts and arms. It was governed by ten archons, who, in their respective districts, adhered to established customs, and were invested with the power of life and death over their subjects. This federal republic was established, according to Plato, in a dialogue of which only a fragment remains, by a law derived from Neptune himself, its first founder, engraved upon a column and placed in a temple. Assemblies were held alternately every five years, in which all public affairs were the subjects of deliberation. The offences of citizens were examined by the archons and punished according to the degree of their aggravation. Plato in this dialogue has recited several ceremonies which were observed by the archons in the exercise of their legislative and judicial offices.

The actual existence and local situation of the Atlantic island has given occasion to many different opinions. The reality of Plato's Atlantis has had many advocates. Buffon (Nat. Hist. by Smellie, vol. i. p. 507), after citing the paillage relating to it from Plato's Timaeus, adds; "this ancient tradition is not devoid of probability. The lands swallowed up by the waters, were, perhaps, those which united Ireland to the Azores, and the Azores to the coast of America, for in Ireland there are the same fossils, the same shells, and the same sea-bodies, as appear in America, and some of them are found in no other part of Europe." M. Bailly, in his "Lettres sur l'Atlantide de Platon, etc." published at Paris, in 1759, 8vo., maintains the existence of the Atlantides, and their island Atlantis, by the authorities of Homer, Sanchoniathon, and Diodorus Siculus, in addition to that of Plato. In proof of the opinion that Plato's account of the Atlantic island is not a fiction of his own devising, a late writer (see Taylor's translation of the Cratylus, Phædo, Parmenides, and Timaeus of Plato, 1793) alleges the following relation of one Marcellus who wrote an history of Ethiopia, referring to Proclus in Tim. p. 55: "That such and so great an island once existed is evinced by those who have composed histories of things relative to the external sea; for they relate that in their times there were seven islands in the Atlantic sea sacred to Persephone; and besides these, three others of an immense magnitude, one of which was sacred to Pluto, another to Ammon, and another, which is the middle of these, and is of a thousand stadia, to Neptune. And besides this, that the inhabitants of this last island preferred the memory of the prodigious magnitude of the Atlantic island, as related by their ancestors, and of its governing for many periods all the islands in the Atlantic sea; and such is the relation of Marcellus in his Ethic history." The learned Rudbeck, professor in the university of Upsal, in an express treatise, intituled, "Atlantica, sive Manheim," maintains, very strenuously, that Plato's Atlantis is Sweden and Norway; and attributes to his country whatever the ancients have laid claim of their Atlantis or Atlantic island. M. Bailly (ubi supra, letter 24.), after citing many ancient testimonies which concur in placing this famous life in the north, quotes that of Plutarch, who confirms these testimonies by a circumstantial description of the life of Ogygus, or the Atlantis, which he represents as situated in the north of Europe, and as having near it three islands more, in one of which the inhabitants of the country say, that Saturn is kept prisoner by Jupiter. The four islands may, as M. Bailly conjectures, be Iceland, Greenland, Spitzbergen, and Nova Zembla, or some others near the Pole. He controverts the opinion of Rudbeck as not conformable with the account of Plato, who represents the Atlantis as an island, which Sweden is not. Adhering still to his system, M. Bailly, perusing by a variety of plausible circumstances, which he has ingeniously combined, places that famous island among those of the Frozen Ocean. In this he is strongly seconded by Plutarch, who tells us that the Atlantis is in a region where "the sun during a whole summer month is scarcely an hour below the horizon, and where that short night had its darkness diminished by a twilight." This, it may be said, is a palpable indication of a northern climate; but how is this situation reconcilable with the fertility of the soil, the mildness of the air, particularly the fruit called the columns of Hercules, which Plutarch and Plato mention among the circumstances pertaining to the abode
abode of the Atlantis? how is it also possible to conceive astronomy cultivated in a frozen and cloudy region, where the observations of the heavenly bodies must have been inconvenient and impracticable? These difficulties, lays out fanciful author, cannot be removed without supposing a change of air and climate in those regions by the gradual cooling of the earth, and its progressive motion towards universal congelation. Such is the "fairy tale" of this learned and ingenious author. Sir W. Jones, the learned president of the Asiatic Society, in his elaborate account of the Periplus (Asiatic Researches, vol. ii. p. 44.), suggerst that one may consider "Irun" as the noldit island, for to the Greeks and Arabs would have called it, or at least as the nothed peninus-fula in this habitable globe; and he adds, "if M. Bailly had fixed on it as the Atlantis of Plato, he might have supported this opinion with stronger arguments than any that he has adduced in favour of Nova Zembla. If the account indeed, of the Atlantees," says this writer, "be not surely an Egyptian or an Utopian fable, I should be more inclined to place them in Irun than in any region with which I am acquainted."

Others will have America to be the Atlantis; and hence infer that the new world was not unknown to the ancients; but what Plato says, does by no means support this supposition. America should rather seem to be the vast continent beyond the Atlantis, and the other islands mentioned by Plato.

Kircher, in his Mundus Subterraneus; and Beckman, in his History of Islands, chap. v. advance the most probable opinion, if the reality of this island be admitted. The Atlantis, according to them, was a large island which extended from the Canaries to the Azores; and those islands are the remains thereof not swallowed up by the sea.

Atlantis, New, is the name of a fictitious, philosophically commonwealth, of which a description has been given by lord Bacon.

The new Atlantis is supposed to be an island in the South-sea, to which the author was driven in a voyage from Peru to Japan. The composition is an ingenious fable, formed after the manner of the Utopia of Sir Thomas More, or Campanella's City of the Sun. Its chief design is to exhibit a model or description of a college, instituted for the interpretation of nature, and the production of great and marvellous works, for the benefit of men, under the name of Solomon's house, or the college of the six days work. Thus much, at least, is finished; and with great beauty and magnificence. The author also propouses a frame of laws, or of the belt flate or mould of a commonwealth: but this part is not executed. Enc. Works, tom. ii. p. 235.

ATLAS, in Biography and Mythology, an ancient king of Mauritia, the son of Uranus and brother of Prometheus, who is said to have lived about the time of Moses, or about 1582 years B.C. He is represented as having been an excellent astronomer, as an observer of the stars, and as the inventor of the sphere. The poets have exhibited him as bearing the heavens on his shoulders, and thus he is seen in the famous statue at the Faun's palace in Rome; and one of them represents him as groaning under the burden, on account of the multitude of gods whom superstition had placed in this elevated mansion. He was metamorphosed into a mountain for his hospitality to Perseus. His daughters, it is said, were transformed into flares, in complement to his astronomical talents and observations; some of them forming the Pleiades, and the other seven the Hyades.

Atlas, in Geography, a celebrated mountain or rather chain of mountains, in Africa, which is so high, that it seems to bear the heavens. Hence the fable, in which Atlas, the king of this country, is said to bear the heavens on his shoulders.

The ancients, however, ascribed to this mountain a magnitude and an elevation to which it has no claim; as it can no where stand in competition with the Alps or the Apennines. They seem to have considered it as one high mountain, not as a ridge. Thus Pliny (l. v. c. 1.), describes it as a detached mountain, rising from the sands to a great height on the shores of the ocean to which it gave its name; and yet, in the same chapter, he represents it as a range passed by Suetonius Paulinus on his progress to the Niger. Strabo (l. xiv.) mentions its being called Dyros, or Aspis, by the ancients, and as being beyond the pillars of Hercules, on turning to the left or fourth. Dr. Shaw (Trav. p. 5.) represents it as a remarkable chain of eminences, which sometimes borders upon the Sahara, and sometimes lies within the Tell. He adds, "that if we conceive, in an easy ascent, a number of hills, usually of the perpendicular height of 4, 5, or 600 yards, with a succession of several groves, and ranges of fruit and forest trees, growing one behind another, upon them; and if to this prospect we sometimes add a rocky precipice of superior eminence, and more difficult access, and place upon the side, or summit of it, a mud-walled Dahkhrah of the Kabyles, we shall then have a just and lively picture of mount Atlas, without giving the least credit to the nocturnal flames, the melodious sounds, or Inebrious reins of such imaginary beings, as Pliny, Solinus, and others, have in a peculiar manner attributed to it." According to some modern accounts, this ridge divides the kingdom of Algeria from Zaaf and Biskulunz, or its direction is south-west and north-east; and therefore it may be considered as extending from Cape Geer in a north-east direction, and giving source to many rivers flowing north and south, till it terminates in the kingdom of Tunis. This main ridge in some places may present a double chain, and in others diverge its branches. Its structure towards the western extremity is granite and primitive. M. Lepriore, in his journey to Morocco, seems to have clearly ascertained the range of Atlas. The town of Santa Cruz islands near its western extremity; while Tarant, on which he passed through an open plain, lies on the south of the Atlas. Hence it appears, that Cape Geer is its termination, or the great Atlas of Ptolomy, while the smaller Atlas is a branch extending towards Saffa or Cape Castan; and another branch, now called the Left or Atlas, reaches to Tangier. According to Cheyney (Prefis State of Morocco, vol. i. p. 12.), Mount Atlas is the eastern boundary of all the western provinces of Morocco. He represents it as formed by an endless chain of lofty eminences, divided into different countries, inhabited by a multitude of tribes, whose ferocity permits no stranger to approach. He professes to be unable to describe these mountains accurately; but adds, that nothing would be more interesting to the curiosity of the philosopher, or conducing more to the improvement of our knowledge in Natural History, than a journey over mount Atlas. The climate, though extremely cold in winter, is very healthy and pleasant; the valleys are well cultivated, abound in fruits; and are diversified with forests and plentiful springs, the streams of which, uniting at a little distance, form great rivers and lakes themselves in the ocean. According to the reports of the Moors, there are many quarries of marble, granite, and other valuable stone, in these mountains; and it is probable, there are also mines, but the inhabitants have no idea of
of these riches: they consider their liberty, which their situation enables them to defend, as the most inexplicable of all treasures.

As the province of Morocco lies to the west of mount Atlas, part of the ancient Numida, call'd the kingdom of Tafdet, situated in a sandy plain, lies to the east: and from Morocco to this province there is no way but by crossing one of the extremities of the Atlas, either by the side of the province of Sus, or by that of Fez: the latter road, being less fruitful than the other, is most frequented.

Atlas, in Anatomy, the name of the first vertebra of the neck, which supports the head. See Vertebræ, and Skeleton.

Atlas, in Commerce, a silk fabric manufactured in the East Indies. It must be owned that the manufacture of these silks is wonderful, especially of the flowered silks; in which the gold and silk are wrought together in such a manner, as no workman in Europe can imitate: yet they are far from having that fine gloss and luster, which the French know how to give their silks.

In the Chinese manufactures of this sort, they gold paper on one side with gold leaf, then cut it into long slips, and wound them into their silks; which makes them with very little cost look very rich and fine. The same long slips are twisted or turned about silk threads for artificially, as to look finer than gold thread, though it be of no great value.

Atlas, in Entomology, a species of Phalæna, belonging to the Bombyx tribe. The wings are falcated or hooked, yellow-brown and varied; a transparent spot in the middle of each wing, with a smaller one next that on the anterior pair. Linnaeus, Fabric. &c.

Phalæna Atlas is the largest insect of the moth tribe hitherto discovered, and is indeed a gigantic creature. The species is common in China, but is not peculiar to that country, being found in other parts of Asia, and in America. The influence of climate may be easily traced on the varieties from different countries; that from Surinam is the largest, and of the deepest colours. The Chinese kind is the next in size; the colours incline to orange, and the anterior wings are more falcated or hooked at the ends; there are two other Asiatic varieties known, that are still smaller, and have the wings extremely falcated.

The larva of Phalæna Atlas is figured by M. Merian in his Insecta Surinamensia, Plate 52: it is about four inches in length, green, with a yellow stripe disposed longitudinally. Upon each segment are four distinct round tubercles, of a coral-like orange colour, which are surrounded with very delicate hairs. The pupa is large, and is inclosed in a web of an ochraceous colour. The silk of this web is of a flaxen texture, and it has been imagined, if woven, would be superior in durability to that of the common silk-worm. Seba has also represented the larva. (f. i. pl. 57., vol. 4.), in his Thefaurus Naturæ. It is figured by him nearly six inches in length, and bulky in proportion; the Phalæna or Moth is also larger than that figured by Merian, which is a small specimen of the Surinamese kind. According to Merian, there are three broods of this insect in a year; they are very common, and feed on the orange trees. Linnaeus says, that they adhere to tenaciously to the leaves, that they can fearlessly be taken off. An opinion has been long prevalent, that the web of this insect might easily be manufactured into a very durable silk; and it certainly admits of doubt whether the Chinese do not actually rear the moth for this purpose. Silk is an important article in China, and other Eastern countries, where the use of linen is little known; the Japanese mimicaries mention several sorts in use among the Chinese, some of which is admired for its beauty, and others for durability; these kinds are probably the produce of different insects, and Phalæna Atlas may be of that number. Lefèvre and Lyonnet, in their "Théologie des Insectes," say, that at this day there are to be found in China, in the province of Canton, silk worms in a wild state, which, without any care being taken of them, make in the woods a kind of silk, which the inhabitants, after work from the trees; it is grey, without luster, and is used to make a very thick and strong cloth, termed there Kim Télon; and by some European naturalists it is imagined to be the product of this very species." Vide Donov. Inf. China (Atlas). We shall again return to this subject under the articles Phalæna, Silk-Works, &c, in treating of these analogous creatures which produce a silk of such strength or beauty as to be useful, or promise to become so, in the concerns of man; a subject this that highly merits consideration; and which we shall endeavor to elucidate as copiously and accurately, as the magnitude and importance of the article demand.

Atlas, a species of Scarabæus, found in South America. The thorax is armed with three knobs, the middle one of which is very short; holy on the head recurved. Linneus, Fabric. Linn. Ent. Syll. Atlas Amблиnæus (Capilla sp.) a name given by some Entomologists to the Linnæan Papilio Parnassus. Muf. petrop. 644, &c.

Atlas is also a title given to books of universal geography, containing maps of the known parts of the world; as if they were viewed from the top of that celebrated mountain, which the ancients esteemed the highest in the world; or rather on account of their holding the whole world like Atlas. The same name is given to maps of the stars.

ATLENBURG, or ATTTLNURGH, in Geography, a town of Germany, in the circle of Lower Saxony, and duchy of Lauenburg, on the Elbe; four miles west of Lauenburg.

ATLITA, in Entomology, a species of Papilio found in the East Indies. This butterfly is indented, brown, glistened with blue; beneath fulvous, with undulated glaucous flanks, and five blind-eye shaped spots. Fabricius and Donov. Inf. India. Gmelin has overlooked this species in his Syll. Nat.

ATLITES, a name under which the species of Papilio Laodæma was at first described in Amoen. Acad. 6. p. 407. 72.

ATMOSPHERE, formed of aëræ, vapour, and ætheræ, a sphere, an appendage of our earth; consisting of a thin, fluid, elastic substance, called air, which surrounds the terrestrial globe to a considerable height, gravitates towards its centre, on its surface, is carried along with it round the sun, and partakes of all its motions both annual and diurnal.

By atmosphere is understood the whole mass, or appendage of ambient air; though among some of the more accurate writers, the atmosphere is restrained to that part of the air next the earth, which receives vapours and exhalations, and refracts the rays of light.

The farther or higher spaces, though perhaps not wholly delimit of air, are supposed to be modified by a finer sub-stantial called ether, and are hence called etherial regions.

For the nature, constitution, properties, and different states and uses of the atmosphere, see Air, the sequel of this article, Eurometer, and Eudiometry; where this subject will be treated of at large as its importance requires.

A late eminent author considers the atmosphere as a large chemical
CHEMICAL VELVET, wherein the matter of all the kinds of sublunary bodies is copiously floating; and thus exposed to the continual action of that immense furnace the sun; whence proceed innumerable operations, sublimations, separations, compositions, digestions, fermentations, patrimonial farts, &c.

Now let a large apparatus of instruments, contrived for indicating and measuring the state and alterations of the atmosphere, be assembled—such as anemometers, barometers, hydrometers, barographs, manometers, thermometers, &c.

Atmosphere, Electricity of the. Define those large quantities of the electric matter, with which the clouds are charged in a thunder-storm, it has been observed first by M. Mounier in 1752, and afterwards repeatedly and with particular attention by others, particularly by the abbe Mazery in 1753, and Mr. Kemanley, that the atmosphere is never wholly destitute of the electric fluid. A particular electrified matter may satisfy himself of this, by extending his arm in the open air, and prefending a long hollow needle with its point upwards; for the electric matter collected from the remoter air will appear luminous, as it converges to the point of the needle. Mr. Canton's balls are likewise an excellent contrivance for the same purpose, and may be made use of, not only for determining the electricity of the atmosphere in general, but the positive or negative quality of it. According to this ingenious philosopher, electrified atmospheric air, when heated, becomes negatively electric; and when cooled, the electricity is of the positive kind, even when the air is not permitted to expand or contract; and the expansion or contraction of atmospheric air occasions changes in its electrical state. But no electricity, in the earlier stage of this science, conducted his observations in this way with greater accuracy and farther pursued them, than M. Bonnet. (See *Beccaria's Essay on Atmospheric Electricity, annexed to the English translation of his Artificial Electricity," p. 421.) From him, we learn, that the atmosphere discovers no signs of electricity in windy and clear weather, nor in moist weather without rain, nor when the sky is covered with distinct and black clouds with a slow motion; but he always observed a moderate, though interrupted electricity, for the most part of the positive kind, in a clear sky, when the weather was calm; and in rainy weather without lightning, a little before the rain fell, and during the continuance of it, till the rain was almost over. The electricity of the atmosphere, according to Beccaria, was always positive, during the day and in dry weather, but always negative, when a bright or clear atmosphere succeeded dark and moist weather. The quantity of atmospheric electricity was found to increase after the rising of the sun, and during his progress; and its augmentation was the more considerable, as the moisture of the air was diminished; but it decreased in the evening. In days equally dry, the degree of electricity at noon was proportional to the degree of heat; and in a serene atmosphere, with little wind, a considerable quantity of the electric matter commonly arose after fun-fest, during the precipitation of dew. Thick fogs were observed, during their ascent into dry air, to carry with them a considerable quantity of the electric matter. And the electricity was stronger, as his rods were higher, and the things, which were extended and insulated in the open air, were longer. Mr. Cavalli (Complete Treatise on Electricity, vol. ii. p. 12, ed. 4.) deduces the following conclusions from his experiments and observations on this subject; viz. that there is in the atmosphere at all times a quantity of electric matter—that the electricity of the atmosphere, and of fogs, is always positive—that, in general, the stronger electricity is observable in thick fogs, and also in frothy weather; and the weaker, when it is cloudy and warm, and rain approaches—that it does not seem to be left by night than in the day—and that the electricity is stronger in places more elevated than those that are lower; and therefore, according to this rule, if it may be extended to any distance from the earth, the electricity in the higher regions of the atmosphere must be exceedingly strong. Mr. Read, in his "Summary View of the Spontaneous Electricity of the Earth and Atmosphere," observes that the electricity of the atmosphere in moderate weather, was always found to be positive; in storms and disturbed states of the air, frequently negative; and suddenly and repeatedly changing from one state to the other. Warm small rain was found to be very slightly electric; large drops, strongly; hail flowers, the most intensely of all. In an easterly wind of long continuance, and reckoned unhealthy, the electricity was so faint, as to require the needle of all known tools for discovering its existence. The vapour of water, as soon as it had attained the height of five or six inches of elevation in the air, was found to be permanently and positively electrified; and the surface from which it evaporated, negatively. Vapour has a greater capacity for electricity, or affords and requires more of this fluid, than water in its dense state; and therefore rarefaction much diminish, and condensation increase, the sensible electric charge of the vapour. Hence, in serene weather, the atmosphere is subject to a regular fluctuation, or increase and diminution of electricity, twice in every twenty-four hours, depending on the action of the sun, and the consequent evaporation and state of the vapours. This diligent observer and judicious reasoner further observes, that a limited portion of the earth's surface is often feebly electrified; over it, there is always a proportionate quantity of the contrary electricity in the atmosphere; and when a electrified cloud is carried forward by wind, an equal and opposite electric charge keeps pace with it on the earth, till the two charges, becoming more augmented, or approaching nearer to one another, or meeting with some conducting medium, rush together, and produce an explosion.

The subject of atmospheric electricity has engaged the particular attention of M. Saffier; and few persons have had more favourable opportunities for observing the phenomena that attend it, or possessed a more extensive acquaintance with meteorology in general, for enabling him to illustrate these phenomena by apposite observations, than this author. He confirms the fact noticed by others, and previously known, that aerial electricity varies according to the situation, being generally strongest in elevated and insolated situations, and not observable under trees, in forests, hedges, or enclosed places. But it is not so much the height, as the situation of the places, which determines the degree of electricity; for the projecting angle of a high hill will often exhibit a stronger electricity than the plain at the top of the hill, as there are fewer points in the former to deprive the air of its electricity. The intensity of the atmospheric electricity is subject to a great variety of changes, of which some depend on obvious circumstances and others are altogether inexplicable. These changes, according to M. Saffier, were sometimes so rapid in their succession, that he had not time to note them down. When rain falls without a thunder, these changes are not so sudden; but with respect to the intensity of the electric force, they are very irregular; whilst the quality of it is more constant. Rain or snow almost always gives positive electricity. In cloudy weather, without rains or storms, the electricity generally follows the same laws as in serene weather. Its intensity
\textbf{Atmosphere.}

Intensity is generally diminished by strong winds, which blend the different \textit{flora} of the atmosphere, cause them to fade towards the ground, and thus distribute the electricity uniformly between the earth and the air. M. Saffure has observed a strong electricity, with a strong north wind. In foggy weather, the electricity is the strongest, unless the fog is about to be diffused into rain. The various modifications of electricity in the atmosphere are observed with the greatest advantage in serene weather. M. Saffure found, in winter and in such weather, that the electricity was generally weakest in the evening, when the dew had fallen, and so continued till the rise; afterwards its intensity augmented by degrees, sometimes sooner and sometimes later; but usually before noon it attained a certain maximum, from which it again declined till the fall of the dew, when it would be sometimes stronger than it had been during the whole day; after which it would again gradually decrease during the whole night; but it was never quite destroyed in weather perfectly serene. Hence it may be inferred, that atmospheric electricity, like the water of the ocean, is subject to a flux and reflux, which produce an increase and diminution twice in twenty-four hours. The moments of its greatest force are some hours after the rising and setting of the sun; and those in which it is weakest precede its rising and setting. Of this periodical flux, M. Saffure has given a remarkable instance, deduced from his observations in an extraordinary degree of cold, and at an elevation of sixty feet above the level of the lake of Geneva. From the return of eighteen of these observations, made during three successive days, when the sky was quite serene, we learn, that the electricity was pretty strong at nine in the morning; that from this time it gradually decreased till about fix in the evening, which was its first maximum: after which it increased again till eight, its second maximum; it then gradually declined till fix in the morning, which was the period of its second maximum; after which, it again increased till ten in the morning, which was the first maximum of the following day: but as this day was cloudy, its periods were less regular. The electricity of serene weather is left easily observed in summer than in winter. In summer, if the ground has been dry for some days, and the air is also dry, the electricity increases from the rising of the sun, till three or four in the afternoon, when it is strongest; it then decreases till the dew begins to fall, when it again increases: but after this it declines and is always subject to nothing but chance. During the serene days that succeed rainy weather in summer generally exhibit the same diurnal periods or states of electricity, with those that are observable in winter. The electricity of the air is invariably positive in serene weather, both in winter and summer, in the day and in the night, in the sun and in the dew. Hence it should seem, that the electricity of the air is essentially positive; and that whenever it appears to be negative, as in particular rains or storms, this state is produced by some clouds which have been exposed to the preflure of the electric fluid contained in the upper part of the atmosphere, or to more elevated clouds that have discharged a part of their fluid upon the earth, or upon other clouds. M. Saffure, having collected these and similar phenomena, as the result of numerous and repeated observations, instituted a set of experiments on evaporation, in order to investigate and ascertain their cause. These our limits will not allow us to detail; but the general result was, that evaporation, which seems to be the vehicle that conveys electric matter into the atmosphere, from China and silver always produces negative electricity; and from iron and copper, generally positive electricity; and hence it may be inferred, that electricity is positive with those bodies that are capable of decomposing water, or of being decomposed themselves by their contact with the water; and negative, with all those which are not at all decomposed or altered. 

As to the producing causes or sources of atmospheric electricity, we may observe in general, that they may be reduced to four, viz. friction, evaporation, heat and cold, and condensation and expansion: and with respect to the changes and modifications to which the atmospheric electricity is continually subject, they may be attributed to the operation of the various causes that produce it, and to the chemical processes that are constantly carried on by means of the various ingredients that compose the atmosphere. M. Volta (Phil. Trans. vol. lxxi. p. 32), in reference to this subject observes, that as the vapours on their condensing lose part of their latent heat, on account of their capacity being diminished they part with some electric fluid. Hence (he says) originates the positive electricity which is always more or less predominant in the atmosphere, when the sky is clear, viz. at that height where the vapours begin to be condensed. Accordingly the atmospheric electricity is stronger in fogs, in which case the vapours are more condensed, so as to be almost reduced to drops, and is still stronger when thick fogs become clouds. In accounting for clouds, negatively electrified, he supposes that when a cloud, positively electrified, has been once formed, its sphere of action is extended a great way round, so that if another cloud comes within that sphere, its electric fluid, according to the well known laws of electric atmospheres, must retire to the parts of it which are most remote from the first cloud: and from thence the electric fluid may be communicated to other clouds, or vapours, or terrestrial prominences; thus, a cloud may be electrified negatively, which cloud may, after the same manner, occasion a positive electricity in another cloud, &c. This explains not only the positive electricity, which is often obtained from the atmosphere in cloudy weather; and the frequent changes from positive to negative electricity, and contrarywise, in stormy weather; but also the waving motion observed in the clouds, and the hanging down of them, so as nearly to touch the earth. For an account of the instruments that are used for discovering and eliminating the electricity of the atmosphere, see \textit{Collector, Condenser, Conductors, and Electrometer: and for further observations on this subject, see also Electricity, Evaporation, Lighting, Rain, Vapour, &c.}

The atmosphere envelops all parts of the surface of our globe; if therefore both the one and the other contained at rest, and were not endowed with a diurnal motion round their axis, then the atmosphere would be exactly spherical, according to all the laws of gravity; for all the parts of the surface of a fluid in a state of rest, must be equally removed from its centre. But the earth and the ambient atmosphere are invested with a diurnal motion, which carries both the one and the other round their axis: and the different parts of both having a centrifugal force, the tendency of which is more considerable and that of the centripetal less, as the parts are more remote from the axis; the figure of the atmosphere must become an oblate spheroid, because the parts that correspond to the equator are farther removed from the axis, than the parts which correspond to the poles. Besides, the figure of the atmosphere must represent such a spheroid, because the sun strikes more directly on the air which encompasses the equator, and is comprehended between the two tropics, than on that which pertains to the polar regions. Whence it follows, that the mass of air, or part of the atmosphere, adjoining to the poles, being less heated, cannot expand so much, nor reach so high. Nevertheless,
clearly understood, nor, indeed, is its existence positively ascertained. But whatever it be, it is such as to counteract the weight of the atmosphere. However, if any considerable preeasure be superadded to that of the air, say, by descending into deep water, it is always felt in a greater or less degree (see Diving), more especially when the change is sudden; and on the other hand, if the preeasure of the atmosphere be taken off from any part of the human body, as by the hand placed over the exhausted receiver of an air-pump, the weight of the superincumbent atmosphere is felt, and the feel of the hand is shrunk down, as it were by fiction, into the flat. We might add, that the heat of our bodies renders the air warm upon its surfaces, and therefore a living animal does not yield an equal atmospheric preeasure with that of immoveable and cold substances. Moreover, as the earth's surface contains, in round numbers, 200,000,000 square miles, and every square mile 27,878,400 square feet, there must be 5,573,680,000,000,000 square feet on the earth's surface; which, multiplied by 1256.4 pounds, will give 12,122,756,000,000,000,000 pounds for the preeasure or weight of the whole atmosphere.

Mr. Cotes (Hydrostatical and Pneumatical Lect. p. 112.) mentions the result of a computation which he made of the weight of all the air, which presses upon the whole surface of the earth; and he observes, that it is equal to the preeasure of a globe of lead, nearly 60 miles in diameter. The computation proceeds upon these principles; that the weight of a column of air, reaching to the top of the atmosphere, is most commonly equal to a column of water, having the same base, and the altitude of 34 feet; that the diameter of the earth is equal to 209465 feet; and that the specific gravity of water is that of lead as 100 to 11125.

The difference of the weight of the atmosphere, and of its consequent preeasure, at different times, and in different situations, is a circumstance that deferves our particular notice. This difference in the same situation arises from changes in the state of the atmosphere; and it chiefly occurs in places at some distance from the equator. It is indicated, and of course easily estimated, by the different height to which the mercury is raised in the barometer. As the greatest variation of the height of the mercury occupies a range of about 3 inches, or from 28 to 31 inches, being 4/24 of the whole range, a column of air of any affilable base, equal to the weight of a cylinder of mercury of the same base, and of the altitude of 3 inches, will be taken off from the preeasure upon a body of an equal base, at such times as the mercury is three inches lower in the barometer; and therefore every square inch of the surface of our bodies is preeased upon at one time more than another, by a weight of air equal to that of three cubical inches of mercury. As this is about 4/24 of the whole quantity, the difference of the preeasure, which the human body preeases at one time more than another, amounts to about 1½ ton. The reason why we are not sensible of this preeasure is explained in the following manner by Borellus, de Mot. nat. a grav. fac. prop. 29, &c. After saying that food, perfectly rammed in a hard veiifel, is not capable, by any means, of being penetrated or parted, not even by a wedge; and likewise that water, contained in a bladder composed equally on all sides, cannot yield or give way in any part, he proceeds: 'In like manner, within the skin of an animal is contained a diversity of parts, some hard, as bones; others soft, as muscles, nerves, membranes, &c.; others fluid, asblood, fat, &c. Now it is not possible the bones should be broke or displaced in the body, unless the weight lay heavy on one part than on another, as we
sometimes see in potters. If the pressure be subdivided, so that it be equally all around, upwards, downwards, and sideways, and no part of the skin be exempt therefrom, it is impossible any fracture or luxation should follow. The same may be observed of the muscles and nerves; which though felt, yet being composed of solid fibres, do naturally sustain each other, and resist the common weight. The same holds of blood and other humours; and as water does not admit any manifest conclusion, to the animal humours contained in their vessels may suffer an attrition from an impulse made in one or more particular places, but can never be forced out of their vessels by an universal compression. It follows, that as some of the parts undergo either separation, luxation, contusion, or any other change of situation; it is impossible any sense of pain should ensue, which can only be the effect of a solution of continuity. This is confirmed by what we see in divers, &c. See Diving.

The fame is farther confirmed by Mr. Boyle, who, including a young frog in a vessel half full of water, and introducing so much air that the water might sustain eight times the weight it otherwise would; yet the animal, notwithstanding the great tenderness of its skin, did not seem at all affected thereby.

Besides, it ought to be considered that the pressure of the atmosphere is uniform and equal on all parts of the body; and that we have been accustomed to it by long experience. It should also be recollected, that when the ordinary weight of the atmosphere is augmented, the weather is commonly dry and serene; the blood is driven to the internal parts; a more abundant secretion of the juices takes place; and the tonic tenion of the solid parts is increased; and these circumstances combined produce an additional flow of spirits, and render us more lively and active. The same beneficial effect is observable even in brute animals. On the contrary, when the weight of the air is diminished, the weather is usually moist and foggy, and the animal frame becomes sensible of oppression, littleness, and inactivity. These changes in the state of the atmosphere, which are felt more or less by persons of all descents, and of which valetudinarians frequently complain, would be more sensibly experienced, if they occurred by very sudden transitions; for to this circumstance the sensation of uneasiness and indisposition is chiefly to be attributed; and accordingly great and sudden changes in the state of the barometer and atmosphere, are generally accompanied with a corresponding alteration in the corporeal frame and animal spirits. But when a change of this kind occurs gradually, and when the same state of the atmosphere continues for some time, its effect is less sensibly perceived; as the body possesses a power of accommodating itself to such change. The spring of that elastic fluid, to which we have already referred, serves as a counterpoise to the pressure of the atmosphere, and when this is diminished it becomes more relaxed, so that the equilibrium between the one and the other is maintained. Hence it happens, that in moist foggy weather, when the pressure of the atmosphere is less considerable, our veins never swell, nor are we sensible of any internal expansion of our bodies; but, on the contrary, the vessels are more dilated, the circulation becomes more languid, and we seem to be oppressed with a weight. Upon the whole, we may observe, that the pressure of the atmosphere resembles a kind of bandage, which being drawn tighter, as in the case of increased pressure, constrains the vessels of the body, and accelerates the circulation; and which being more relaxed, as in the diminished pressure, occasions a diffusion of the vessels, and is attended by a more slow and languid circulation. But this is a subject, in the elucidation of which physiologists are not agreed. As variations of the atmospheric pressure in the same place produce effects that are sensibly felt, particularly by persons of delicate and tender constitution, whatever explication may be given of these effects, and to whatever intermediate causes they may be ascribed; the changes of pressure are also perceived in different situations, as they are more elevated or depressed. Indeed, if the ascent from lower to higher stations, and vice versa, be gradual, the body adapts itself to the changes that attend them, and they are scarcely, if at all, perceptible; but in the case of a more rapid ascent or descent, or when the difference of height is very considerable, the effects are more sensible and apparent. Many facts and observations to this purpose have been furnished by those who have ascended in balloons, or defended in diving-bells. (See Aërostation, and Diving.) The accounts given by persons who have ascended considerable eminences above the level of the sea, have been very various; nor is it certain that the effects they have perceived have been owing wholly or merely to the variation of the atmospheric pressure. Some have complained of a total suffocation, which they have ascribed to the dilatation of the corporeal vessels, of obstructions to the actions of the respiratory organs, of violent renderings and vomittings of blood, and, in some cases, the extrusion of blood through the fine coats of the lungs, and an enflaving hemoptysis. M. Sauvage, in his ascent to the top of Mount Blanc, felt great uneasiness, as he advanced upwards. He informs us, that his respiration was much oppressed, the circulation of blood accelerated, and the pulse quickened, that he was seized with other symptoms of a fever; and that his strength was also very much exhausted. These symptoms of oppression and debility; however, did not begin to appear till he had ascended to the perpendicular height of 23 miles above the level of the sea, and upon an additional ascent of ½ of a mile, he found the symptoms above recited. To some other concurring causes, besides the rarity of the atmosphere, it is natural to ascribe some of these symptoms; and, indeed, he himself says, that the atmosphere at the top of the mountain was much more impregnated with carbonic acid, which is known to be pernicious to animals, and to be productive of some of the above-mentioned effects. In other cases, persons in elevated situations have experienced no effects like those which M. Sauvage has related, and which the mechanical theory of diminished pressure would lead us to expect. Mr. Brydone and M. Bowell mention no inconvenience of this kind to which they were subject on the top of Mount Etna; nor do the French mathematicians, who were for some time on the summit of a very high eminence of the Andes, make any other complaint besides that of the difficulty of respiration. (See Aësdes.) But Dr. Heberden, who ascended to the top of Teneriffe, a mountain higher than Etna, makes no mention even of this circumstance. It has also been alleged, that no inconvenience has been experienced by a gradual descent in the diving-bell to considerable depths in the sea, as long as the persons who have descended have remained in the air in the bell; though they have found a very material difference on exposing themselves to the pressure of the water. See Diving. It is not easy to assign the true cause of the variations of the atmospheric weight and pressure that occur in the same situation. In places within the tropics, where these variations are not very considerable, the chief cause seems to be the heat of the sun; and its effects are regular and uniform, as the mercury in the barometer subides about half an inch in the day, and rises again to its former height in the night. But in the temperate zones the range is much greater, extending...
tending from 28 to 31 inches, and flowing, by its various altitudes, corresponding variations in the weather. The caules that influence the variations of the one, produce also a familiar effect on the other; and if the former were known, the latter might be ascertained. The immediate causes may probably be reduced to the two following: viz., an emission of latent heat from the vapours of the atmosphere, or of electric fluid from these or from the earth. Both these caules are observed to produce the same effect with the polar sea in the tropical climates, which is that of rarefying the air by blending with it, or setting loose a lighter fluid, which did not previously act with such power in any particular place. For a more particular account of different theories on this subject, see Barometer, Hall, Meteorology, Rain, Snow, Weather, and Wind. Of the importance and utility of this property of the atmosphere, many instances occur in the animal economy, chemical processes, and mechanical operations. See Cuffing, Respiration, Colour, Convection, Vapour, Pump, and Syphon.

With the gravity and pressure of the air are nearly connected its other properties of density and elasticity. The density of the atmosphere must principally depend on its gravity and, in general, increase and decrease in the same proportion. In the lower and intermediate strata of the atmospheric air, this ratio obtains: but it is not uniform and constant in all elevations. In the higher regions of the atmosphere, where the electric fluid abounds, this fluid may diminish the gravity of the atmosphere, without affecting its density. Besides, the density of the atmosphere in the torrid zone will not decrease so fast in proportion to the height of the column, as in the temperate and frigid zones; because the column is larger, and because a greater portion of atmospheric air occupies the higher parts of this column. Consequentlv, the density of the atmosphere at the equator, which is less at the surface of the earth, and at a certain height equal, and at a greater height exceed, the density of the atmosphere in the temperate zones and at the poles. As a current of atmospheric air is continually ascending at the equator, and part of it occupies the higher regions of the atmosphere, and as its fluidity will prevent its accumulation at the equator, it will of course descend towards the poles; and during our winter a greater portion of the equatorial column will flow to the northern than to the southern hemisphere; but a less portion will pursue this course during the summer. The mercurial column, therefore, will be always highest with us in winter, and the corresponding range of the barometer more considerable than in summer; and vice versâ. The density of the atmosphere will be materially affected by the caloric or matter of heat which it contains, and of course it will depend in a great measure on the degree of cold which prevails. Where the cold is greatest, the density of the atmosphere will also be greatest, and its height will be diminished. In those countries which abound with high mountains that are generally covered with snow, the cold will be more intense than in others less elevated, though situated in the same latitude; and of course the height of the atmospheric columns will be proportionally lower. Hence the superior air in its passage to the poles will be retarded, and accumulate over them. Such accumulations will take place over the north-western parts of Asia, and over North America; and on this account the barometer usually stands higher, and its range is more uniform than in Europe. Similar accumulations are also formed in the southern parts of the old continent; for instance, over the mountainous tract of Thibet, Tartary, Turkey in Europe, Africa, and even in some degree on the Pyrenees and Alps.

When these accumulations have for any time prevailed, the density of the atmosphere becomes too considerable to be balanced by the surrounding medium; and of course it will descend towards the regions of the atmosphere that lie over the adjacent countries, and produce cold winds, that will raise the mercury in the barometer. Thus the north-east winds in Europe are occasionally accompanied by a rise of the barometer, because they proceed from accumulations of the atmosphere in the north-western parts of Asia, or about the poles; and hence it is, that the north-west wind from the mountains of Thibet raises the barometer at Calcutta.

As the mean heat of our hemisphere is not perpetual, the density of the atmosphere, and consequently the quantity of equatorial air which flows towards the poles, must be subject to corresponding variations. The accumulations of atmospheric air on the mountains parts of the south of Europe and Asia, occasionally exceed their usual limit, which is partly owing to earlier falls of snow, or to the exclusion of the polar rays by fogs of long continuance. In this case the atmosphere in the polar regions will contain a corresponding diminution of density. In the torrid zone and equatorial regions the heat is uniform; and the density of the atmosphere, modified by it, as well as the height of the atmosphere, will not be subject to much variation. Kirwan, Irish Trans. for 1785, p. 66. See Density. See also Barometer, under which article the cause of the variations in the weight and pressure of the atmosphere is particularly discussed. For the effects of the removal of the pressure of the atmosphere, see Air Pump, and Vacuum. For the elasticity of the atmosphere, see Air and Elasticity of the air.

Atmosphere, Height of the. The height of the atmosphere has been a subject of particular investigation; more especially since it was discovered by the Torricellian tube, that air is charged with weight and pressure. And, indeed, if the air possessed no elastic power, but were everywhere of the same density, from the surface of the earth to the extreme limit of the atmosphere, like water, which is equally dense at all depths, the whole height of the atmosphere might be ascertained without difficulty. It has already been observed, that the weight of a column of air, reaching to the top of the atmosphere, is equal to the weight of the mercury contained in the barometer, and counterbalancing it; and the proportion of weight likewise being known between equal bulks of air and mercury; it will be easy to find the height of such a column, and consequently that of the atmosphere itself. — For a column of air, one inch high, being to an equal column of mercury as 1 to 1356.4; it is evident that 1156.4 such columns of air, that is, a column 9.67 feet high, would be equal in weight to one inch of mercury; and consequently the 30 inches of mercury sustained in the barometer, require a column of air 2840 feet high; whence the height of the atmosphere would only be 2840 feet, or little more than five English miles and a quarter high.

But the air, by its elastic property, expands and contracts; and it being found by repeated experiments in England, France, and Italy, that the spaces it takes up, when compressed by different weights, are reciprocally proportional to those weights themselves; or, that the air takes up the less space, the more it is pressed; it follows, that the air in the upper regions of the atmosphere, where the weight is so much less, must be much rarer than near the surface of the earth; and, consequently, that the height of the atmosphere must be much greater than is above ascertained.

Mr. Cotes, in his Hydrostatical Lectures, lect. ix. has
demonstrated, in a very familiar and intelligible manner, that if any number of distances from the surface of the earth be taken in an arithmetical progression, the denities of the air at those distances will be in a geometrical progression. Let $a = x$, (Plate IX. Pneumatics, Fig. 72.) represent a vessel reaching from the surface of the earth $a$ to the top of the atmosphere $xx$; and let the side $xx$ be divided into inches $ab$, $bc$, $cd$, &c. and let the lines $bl$, $el$, $dm$, &c. be drawn parallel to $xx$. It is evident that the air contained between these parallel lines becomes rarer as we ascend, because every ascending parallel successively is prefalled by a less column of superincumbent air than the next below it. Suppose then that the air $ab$ is everywhere uniform, but denser than the air $bl$, and so upwards. Let the air $bl$ be reduced into a less space $bl$, so as to become of equal density with the air $ab$, by making the space $bl$ less than $bl$, in the proportion that the air $bl$ is less dense than the air $ab$. And let a similar construction be continued, so as to reduce every inch breadth of air to the same density with the air $ab$. The spaces $ab$, $bg$, $cr$, &c. will evidently be as the densities of the several inches of the air, $ab$, $bl$, $cm$, &c. and the quantity or weight of the superincumbent air belonging to each of these spaces, and reaching to the top of the atmosphere, will always be as the sum of all the spaces situated above any space proposed; the quantity or weight being, by the construction of the figure, as the space which it possesses. Since then the density of the air is as the force which compresses it, and this force is the quantity of superincumbent air, the densities of the air between $ab$ and $bl$, $bl$ and $el$, $el$ and $dm$, &c. are to each other as the quantities of air above $ab$, $bg$, $cr$, &c. up to the extremity of the atmosphere. But these densities, by what we have already shown, are as the spaces $ab$, $bg$, $cr$, &c. and the quantities of superincumbent air are as the spaces $abc$, $bcg$, $crg$, &c.; therefore the spaces $ab$, $bg$, $cr$, &c. are to each other respectively as the spaces $abc$, $bcg$, $crg$, &c. Now the former spaces $ab$, $bg$, $cr$, being the differences of the latter, and mutually proportional, are, by a well known theorem in proportion, in a geometrical progression; as the distances $ab$, $ac$, $ad$, are in an arithmetical progression. And thus the densities of the air belonging to every one of the inches, continued to the extremity of the atmosphere, decrease in the same geometrical progression; and every least variation of altitude will cause the same proportionable variation of density in the air. As the rarity of the air is reciprocally as its density, we may conclude that if the distances from the earth increase in an arithmetical progression, the different degrees of rarity of the air increase in a geometrical progression. Whence it is obvious, since an arithmetical series, adapted to a geometrical one, is analogous to the logarithms of the said geometrical one, that the dilatations are every where proportional to the logarithms of the corresponding rarities. It is also plain, that, as the distances or altitudes are proportional to the logarithms of the densities or weights of the air, any height taken from the earth's surface, which is the difference of two altitudes to the top of the atmosphere, is proportional to the difference of the logarithms of the two densities there, or to the logarithm of the ratio of those densities, and their corresponding compressing forces, as measured by the two heights of the barometer there.

This law was first observed and demonstrated by Dr. Halley, from the nature of the hyperbola; and afterwards by Dr. Gregory, by means of the logarithmic line. See Phil. Trans. No 181, or Abr. ibid. vol. 11, p. 13, and Greg. Astron. lib. iv, prop. 3. See the further illustration and proof of it under the article Atmospheric Logarithmic.

From this proposition, having made two or three arithmetical observations of the rarity or density of the air at two or three different known heights, it is easy to deduce a general rule for determining its rarity or density at any other height, or the height corresponding to any rarity or density; and consequently the altitude of the whole atmosphere, supposing the utmost degree of rarity known, beyond which the air cannot go.

But it is to be observed, that these computations of the rarity of the atmosphere, at different heights, are founded on this principle, that the density of the air is everywhere proportionable to the superincumbent weight. And this rule holds true only upon the supposition that the heat is uniform at different distances from the earth; for if the air be hotter in one part than in another, the air will be more rarified in the hotter part than it will be in the cooler, although prefalled by the same weight, or at the same altitude above the earth's surface.

It must not be here omitted, that some observations made by Cassini, and his associate, seem to render this method precarious. In continuing the meridian line of the observatory at Paris, they measured the altitudes of several mountains with great accuracy; noting the height of the barometer at the top of each; and found that the rarefactions of the air, as you ascend from the level of the earth, are much greater than they ought to be, according to this proportion. Suspecting therefore the justice of the experiments, the Royal Academy made divers others, under great dilatations of air, far exceeding the rarities found on the tops of the mountains; the result whereof was, that they all exactly answered the proportion of the incumbent weights. Whence it should follow, that the higher air about the tops of mountains is of a different nature, and oberves a different law from that near the earth.

This may be owing to the great quantity of grave vapours and exhalations here, more than there; which vapours being less elastic, and not capable of so much rarefaction as the pure air above, the rarefactions of the pure air increase in a greater ratio than the weights diminish. M. Fontenelle, however, from the experiments made by M. de la Hire, accounts for the phenomenon in a different manner; alleging, that the elastic power of air is increased by the admixture of humidity therewith; and consequently that the air near the tops of mountains, being moister than that below, becomes thereby more elastic, and rarefies in a greater ratio than naturally and in a drier state it would. But Dr. Jurin shows, that the experiments produced to support this fiction are by no means conclusive.Append. ad Varen. Geograph.

M. Bouguer likewise, in the Memoirs of the Royal Academy of Sciences at Paris for the year 1753, intimated his opinion, that the condensations of the atmosphere did not observe the same law at different heights: and endeavoured to account for the variation, by supposing that particles of air at different heights are prefalled of unequal degrees of elasticity. If this were the case it would be impossible to apply the barometer to the menuration of heights with any degree of certainty. But M. de Luc has shown, by his more accurate experiments, that this pretended inequality of spring in the particles of air does not subsist; and that its condensations and dilatations follow the same law uniformly at all heights and in all climates, excepting only the differences that are caused by heat, and other local circumstances. Admitting therefore the principles above stated, as applicable to all altitudes within our reach, or as far as the summits of the highest mountains on earth, when a correction is made merely for the difference of heat or temperature,
Atmosphere.

ture; he determined the altitudes of hills both by the barometer and also by geometrical measurement; and showing how to allow for the difference of temperature, he has given a rule for the measurement of heights by the barometer, deduced from a greater number of experiments, and much more accurate than any before published. See his " Recherches sur les Modifications de l'Atmosphère," vol. ii. Similar rules have also been deduced from accurate experiments by Sir George Shuckburgh and general Roy, both concurring to show that such a rule for the altitudes and densities holds true for all heights that are accessible to us, when the elasticity of the air is corrected on account of its density; and the result of their experiments showed, that the difference of the logarithms of the heights of the mercury in the barometer at two stations, multiplied by 10,000, is equal to the altitude in English fathoms of the one place above the other; that is, when the temperature of the air is about 31 or 32 degrees of Fahrenheit's thermometer; and a certain quantity more or less, according as the actual temperature is different from that degree. See the principles and application of these rules, detailed more at large, under the article Barometer. But it may be shown, that the same rule may be deduced independently of a train of experiments merely by means of the density of the air at the surface of the earth. Thus, let $D$ denote the density of the air at one place, and $d$ the density at the other; both measured by the column of mercury in the barometer; then the difference of altitude between the two places will be proportional to the log. of $D$ — the log. of $d$, or to the log. of $\frac{D}{d}$. But as this formula expresses only the relation between different altitudes, with respect to their densities, recourse must be had to some experiment in order to obtain the real altitude which corresponds to any given density, or the density which corresponds to a given altitude. The first and most natural is that which results from the known specific gravity of air, with respect to the whole pressure of the atmosphere on the surface of the earth.

Now, as the altitude is always as the log. of $\frac{D}{d}$, assume $b$, so that $a = b \times \log. \frac{D}{d}$, where $b$ will be of one constant value for all altitudes; and to determine that value, suppose a cafe in which we know the altitude $a$ corresponding to a known density $d$; as, e. g. take $a = 1$ foot or 1 inch, or some such small altitude; and because the density $D$ may be measured by the pressure of the whole atmosphere, or the uniform column of 27,600, when the temperature is 55°, 27,600 feet will therefore denote the density $D$ at the lower places, and 27,599 the density $d$ at one foot above it; consequently, we have this equation, viz. $a = b \times \log. \frac{27,600}{27,599}$, which by the nature of logarithms is nearly $b \times \frac{4342948}{27000} = \frac{b}{63551}$ nearly; and hence $b = 63551$ feet, which gives this formula for any altitude in general; viz. $a = 63551 \times \log. \frac{D}{d}$, or $a = 63551 \times \log. \frac{M}{m}$ feet, or dividing by 6, the number of feet in a fathom, $10,592 \times \log. \frac{M}{m}$ fathoms, where $M$ denotes the column of mercury which is equal to the pressure of the atmosphere at the bottom, and $m$ that at the top of the altitude $a$; and where $M$ and $m$ may be taken in any measure, either feet or inches, &c. This formula is adapted to the mean temperature of the air 55°; but it has been found by the experiments of Sir George Shuckburgh and general Roy, that for every degree of temperature, indicated by the thermometer, different from 55°, in the medium between the temperature at the top and bottom of the altitude $a$, the altitude $a$ will vary by its 435th part, which must be added when the medium exceeds 55°, and otherwise subtracted. It should also be observed, that a column of 30 inches of mercury varies its length by about the 9260th part of an inch for every degree of heat, or rather the 9600th part of the whole volume. This formula may be rendered much more convenient for use by reducing the factor 10,592 to 10,000 by changing the temperature proportionally from 55°; thus, as the difference 592 is the 18th part of the whole factor 10,592, and as 18 is the 24th part of 435; therefore the change of temperature, corresponding to the change of the factor $b$, is 24°, which reduces the 55° to 31°. Consequently, the formula becomes $a = 10,000 \times \log. \frac{M}{m}$ fathoms, when the temperature is 31°, or nearly the freezing point; and for every degree above that, the result must be increased by $\frac{m}{1000}$ times its 435th part, and proportionally diminished below it.

This formula may be comprised under the following principles: 1. Observe the height of the barometer at the bottom of any height or depth proposed to be measured, together with the temperature of the mercury by means of the thermometer attached to the barometer, and also the temperature of the air in the shade by another thermometer which is detached from the barometer. 2. Let the same thing be done also at the top of the said height or depth, and as nearly as possible at the same time; reduce these altitudes of the mercury to the same temperature, if it be thought necessary, by correcting either the one or the other, viz. augmenting the height of the mercury in the colder temperature, or diminishing that in the warmer, by its 9600th part for every degree of difference between the two, and the altitudes of the mercury so corrected are those denoted by $M$ and $m$ in the above formula. 3. Take out the common logarithms of the two heights of mercury so corrected, and subtract the less from the greater, cutting off from the right hand side of the remainder three places for decimals, and then those in the left hand will be fathoms in whole numbers, the tables of logarithms being supposed to comprehend seven places of decimals. 4. Correct the number last found for the difference of the temperature of the air, in the following manner; viz. take half the sum of the two temperatures of the air, shown by the detached thermometers, for the mean one; and for every degree by which this differs from the standard temperature of 31°, take so many times the 435th part of the fathoms above found, and add them if the mean temperature be more than 31°, but subtract them if it be below 31°, and the sum or difference will be the true altitude in fathoms, or being multiplied by 6, it will give the true altitude in English feet.

Example I. To find the altitude, when the rate of the barometers and thermometers is as follows, viz.

AS
It might easily be shown by pursuing the calculation in this table, that a cubic inch of the air we breathe would be so much rarified at the altitude of 500 miles, that it would fill a sphere equal in diameter to the orbit of Saturn. Hence it appears that the atmosphere, however indefinitely it may be expanded, becomes at a comparatively small distance, so rare and light, as to be utterly imperceptible in its effects as a refracting medium; and if the atmospheres of the planets resemble that of the earth, they must be so attenuated at the distances of the planets from one another, as to give no sensible resistance to their motions round the sun for many ages.

M. de la Hire, after Kepler, recurred to the more ancient method of ascertaining the height of the atmosphere, viz. from the consideration of the crepusculum. It appears, from the observations of astronomers, of the duration of twilight, and of the magnitude of the terrestrial shadow in lunar eclipses, that the effect of the atmosphere to reflect and intercept the light of the sun, is sensible to the altitude of between 40 and 50 miles. So far then we may be certain that the atmosphere reaches; and at that altitude we may collect, from what has been already said, that the air is above 10,000 times rarer than at the surface of the earth. How much farther the atmosphere may extend, we are altogether ignorant. Cotes's Hydrot. Lect. p. 123. and 125.

It is allowed by astronomers, that when the centre of the sun is 18° or 27° below the horizon, the twilight begins or ends: now the ray which we fee can be no other than a horizontal line, or a tangent to the earth in the place where the observer is; but this ray cannot come directly from the sun, which is under the horizon; and must therefore be a ray reflected to us by the hollow inner and concave surface of the atmosphere. We are to suppose that the sun when 18° or 27° below the horizon, emits a ray which is a tangent to the earth, and strikes upon the lower surface of the atmosphere, and is thence reflected to our eye, being still a tangent, and horizontal. If there were no atmosphere, there would be no crepusculum; and consequently, if the atmosphere were not so high as it is, the crepusculum would begin and end when the sun is at the distance of the sun at 18° or 27°, and consequently. Hence we infer, that the extent of the arc by which the sun is depressed, when the crepusculum begins or ends, determines the height of the atmosphere. We are to note, however, that 33° must be subtracted from the arc of 18° for the refraction which raises the sun so much higher than he would be; and 16° more for the height of the upper limb of the sun, which is supposed to be its highest above his centre, so that the arc which determines the height of the atmosphere is only 15° 17'. Two rays, one direct and the other reflected, but both tangents to the earth, must necessarily meet in the atmosphere at the point of reflection, and comprehend an arc between them of 17° 11', of which they are tangents. Hence it follows, from the nature of the circle, that a line drawn from the centre of the earth, and cutting the arc in two, will go to the point of concurrence of those two rays; and as it is easy to find the excess of this line above the semi-diameter of the earth, which is known, it is easy to find the height of the atmosphere, which is only that excess. See CREPUSCULUM.

On this principle, M. de la Hire discovered the height of the atmosphere to be 37233 fathoms, or near 17 French leagues. The same method was also made use of by Kepler, who only rejected it, because it gave the height of the atmosphere twenty times greater than he otherwise allowed.
The nature of the curve, which is described by a ray of light in passing through the atmosphere, has been the subject of tedious investigation. M. de la Hire took great pains to demonstrate, that, supposing the density of the atmosphere proportional to its weight, this curve is a cycloid; and he says, that if the ray be a tangent to the atmosphere, the diameter of its generating circle will be the height of the atmosphere; and that this diameter increases, till at last, when the rays are perpendicular, it becomes infinite, or the circle degenerates into a right line. This reasoning supposes that the surface of the atmosphere is a plane; but since it is a curve, he observes that these cycloids become in fact epicycloids. Hermanns, in his "Phoronomia," has detected the error of M. de la Hire; and shown that this curve is infinitely extended, and has an asymptote; and Dr. Brook Taylor observes, "Method. Inern." p. 168, that it is one of the most intricate and perplexed that can well be proposed. This ingenious author computes the refractive power of the air, to be 100,000,000 to 1.

The extreme rarity of the atmosphere at considerable altitudes, such as those of forty or fifty miles, bounding the production of twilight, has perplexed philosophers in accounting for meteors, which, whatever be their origin, whether electrical or otherwise, are observed at a much greater elevation than that to which the refractive power of the atmospheric air extends. A very remarkable one of this kind was observed by Dr. Halley in the month of March 1719; the altitude of which he computed to have been between 69 and 73° English miles; its diameter being 2800 yards or more than a mile and a half, and its velocity about 350 miles in a minute. Others of a similar kind, but of a greater altitude and velocity, have been observed by others; and particularly one seen in August 1783, whose height above the earth could not be less than ninety miles, and its diameter was not less than the former, whilst its velocity was certainly not less than 1000 miles in a minute. From analogy and reasoning it is very probable, that such meteors are not essentially different from those that are seen near the surface of the earth. Nevertheless in the high regions where they are observed, the atmosphere, according to our computation, ought not to have density sufficient to support flame and to propagate sound; and yet such meteors are commonly succeeded by one or more explosions, and are accompanied, as it has been reported, with a hissing noise as they pass over our heads. The meteor of 1719 was not only very bright, so that for some time it changed the night into day, but was attended with an explosion that was heard over all the island of Britain, occasioning a violent confusion of the atmosphere and seeming to shake the earth itself. And yet, in the regions in which this meteor moved, the air ought to have been 300,000 times rarer than the air we breathe, or 10,000 times rarer than the vacuum commonly made by a good air-pump. Dr. Halley conjectures, that the immense magnitude of such bodies may compensate for the rarity of the medium in which they move. Allowing them to be electrical phenomena, difficulties occur in explaining several circumstances attending them; and particularly the splendor of their appearance, which requires a circumambient fluid capable of condensing and conducting the electric matter of which they are composed. From late experiments, it has been inferred, that the electric fluid cannot pervade a perfect vacuum. See Meteor.

The atmosphere constants. Refraction and Reflection of the. That the atmosphere has a refractive power, which is the cause of many phenomena, is unquestionable. This power is ascertained by the production of twilight above notice, and by many other facts and experiments. Alhazen the Arabian, who lived about A. D. 1000, seems to have been more inquisitive into the nature of refraction than the preceding writers. But neither Alhazen, nor his follower Vitello, knew any thing of its just quantity, which was not known to any tolerable degree of exactness, till Tycho Brahe, with incredible diligence, settled it. But neither Tycho, nor Kepler, discovered in what manner the rays of light were refracted by the atmosphere. Tycho thought the refraction was chiefly caused by dense vapours, very near the earth's surface. Kepler placed the cause wholly in the higher regions of the atmosphere, which he took to be uniformly dense; and thence he determined its altitude to be little more than that of the highest mountains. But the true constitution of the atmosphere, deduced afterwards from the Torricellian experiment, afforded a fuller idea of these refractions, especially after it appeared by a repetition of Mr. Lowthorp's experiment, that the air's refractive power is proportionable to its density. By this variation of the air's density, a ray of light, in passing through the atmosphere, is continually refracted at every point, and thereby describes a curve, and not a straight line, as it would have done were there no atmosphere, or were its density uniform. See Refraction.

The atmosphere, or air, has also a reflexive power; and this power is the cause that enlightens objects so uniformly on all sides. The absence of this power would occasion a strange alteration in the appearance of things; their shadows would be so very dark, and their sides enlightened by the sun so very bright, that probably we could see no more of them than their bright halve; and that, for a view of the other halve, we must turn them half round, or, if immovable, must wait till the sun could come round upon them. Such a pellucid inefflusive atmosphere would indeed have been very commodious for astronomical observations upon the course of the sun and planets among the fixed stars, visible by day as well as by night; but then such a sudden transition from darkness to light, and from light to darkness immediately, upon the rising and setting of the sun, without any twilight, and even upon turning from or to the sun at noon day, would have been very inconvenient and offensive to our eyes.

However, though the atmosphere is greatly afflissant to the illumination of objects, yet it must also be observed that it stops a great deal of light. By M. Bouguer's experiments, it seems that the light of the moon is frequently 2000 times weaker in the horizon, than at the altitude of 66 degrees; and that the proportion of her light at the altitudes of 66 and 19 degrees, is about 3 to 2. The lights of the sun must bear the same proportion to each other at those heights, which M. Bouguer made choice of.
as being the meridian heights of the sun, at the summer and winter solstices, in the latitude of Croûte in France.

Smith's Optics, Rem. 95. See LIGHT, and REFLECTION.

ATMOSPHERE. Salubrity of the. See EPIIDEMIOLOGY.

ATMOSPHERE. Temperature of the. The variable temperature of the atmosphere, at different seasons and different situations, has been the subject of elaborate investigation; and many speculations and theories have been proposed in order to account for the changes which it undergoes. That the presence of the sun is the principal source of heat as well as of light, and its absence of cold, is too obvious to have been ever doubted; and the effect produced by the greater or lesser obliquity of its rays has been long and universally observed and acknowledged. From this fact, however, the ancient philosophers of Greece and Rome too haughtily inferred, that the torrid zone, under a vertical sun, and the frigid zone, where its rays fall very obliquely, were uninhabitable. Time corrected this mistake; and presented new phenomena which it has been found difficult to explain.

The hottest days are frequently felt in the coldest climates, and the greatest cold, as well as perpetual snow, are found in countries bordering on, or even immediately under, the equator. In the same latitudes, very different temperatures have been observed, not only in different, but even in the same hemisphere. The temperature of the eastern coast of North America differs widely from that of the western opposite coast of Europe, but agrees nearly with that of the eastern coast of Asia lying between the same parallels. Mem. Philad. vol. i. Thence, and similar circumstances, have made it necessary for meteorologists to recur to other causes of varying temperature, besides the immediate agency or absence of the solar rays. Dr. Halley has, indeed, proved, that, abstracting from the intervention of fogs, mists, and mountains of ice, the hottest weather might, in summer, take place even under the poles, the duration of the sun's light more than compensating for the obliquity of its direction (see HEAT); but as many physical causes obstruct the activity of the solar rays in these and other regions, it was necessary to recur to some other cause.

At length M. de Mainan (Mem. Acad. Par. 1734 and 1757) discovered, that the rigour of the cold of winter is tempered by the heat imparted to the atmosphere by the earth itself; which heat, probably poofed from its origin, is preserved and renewed by the incessant influences of the fun, to which one-half of its surface is constantly exposed. Admitting this fact, the temperature of the atmosphere must depend on the capacity of the earth for receiving and retaining heat, and for communicating it to the surrounding medium. But as the earth is composed of land and water, it should be considered that the capacities of these constituent parts for receiving both heat and cold are very different. Land, particularly when dry, receives heat from the sun's rays very readily, but transmits it through its own substance to great depths very slowly; and, on the other hand, water, by reason of its transparency, receives heat very slowly, but diffuses what it receives more readily. Dr. Hales found, that in the month of August, 1724, when the air, and the surface of the earth, were both at 88°, a thermometer, placed only two inches under the surface, stood at 85°; another, 16 inches under the surface, indicated 76°, and a third, 24 inches deep, stood at 68°. The two last thermometers preferred the same temperature both day and night, till the end of the month, and then fell to 63° or 61°; the earth obstinately retaining its heat, at that depth, though the temperature of the air frequently varied.

On the 26th of October, a thermometer, exposed to the air, stood at 35.5°; but one sunk two inches in the earth was heated to 42.8°; another at the depth of 16 inches, stood at 48.8°; and another, 24 inches deep, showed 52°; and from the 15th to the 18th of November, when the temperature of the external air was 27°, a thermometer placed at the depth of 24 inches, stood at 23.8°; but from the month of March to that of September in the following year, the external air was constantly warmer than the earth at the depth of 16 inches or 2 feet: the season, however, was very rainy, and the evaporation, thus occasioned, prevented the earth from being warmed so much as it otherwise might have been. Hales Veget. Statics, vol. i. p. 61, &c. From these experiments it may be inferred, that the surface of the earth is much heated during the summer, but that the heat descends very slowly, a great part of it being communicated to the air; that during the winter, the earth gives out to the air the heat which it had received during the summer; and that wet summers must be succeeded by cold winters. The experiments of Dr. Hales furnish nearly the same results with those of Mariotte (Sur le Froid et le Chaud, p. 189.) who found, that the earth is gradually heated during the summer, and as gradually cooled during the winter months; and that, at the distance of a few feet under the surface, it is constantly warmer than the external air; and the excess was found to remain till April, when the surface is again heated by the sun's rays, and slowly transmits its heat downwards. Hence it appears, that at the distance of about 80 or 90 feet below the surface, provided that there be a communication with the external air, or at a less depth if there be no such communication, the temperature of the earth admits of very slight variation, and generally approaches to the mean annual heat. Then the temperature of rising is nearly the same as the annual temperature, and varies very little. M. Van Swinden has observed, that the greatest cold, and even that which exceeds O of Fahrenheit's scale, if it falls more than a few days, penetrates no deeper than 20 inches when the earth is covered with snow, and not above 10 inches if no snow lies on the surface; and this fact evinces the important and useful purpoes answered by this covering in high northern latitudes. Such facts tend to prove, that the heat of the earth does not increase as we descend into it; but at the greatest depths it is nearly the same as the mean annual temperature of the latitude. It has been observed, that land is capable of receiving much more heat or cold than water. To this purpose, Dr. Raymond found, in the neighbourhood of Marfeilles, land frequently heated to 160°; but he never found the sea hotter than 77°; and in winter he frequently observed the earth cooled down to 14° or 15°, but the sea never lower than 44° or 45°. (Mem. de la Société de Med. de Paris, an. 1778, p. 70.) From these facts it is an obvious inference, that the atmosphere which lies over the sea should maintain a more uniform temperature than that over the land; and this is found to be the fact; nor is it difficult to give a satisfactory explanation of it. During summer, the temperature of the sea on its surface is constantly diminished by the proceeds of evaporation; and in the winter, when the superficial water is cooled, it descends by its augmented gravity to the bottom, and its place is occupied by water of a higher temperature. This alternate change of this heavier and lighter air proceeds, and the winter chalques before the atmosphere has diminished the temperature of the water below a certain degree. Between the mean annual temperature of the atmosphere over the ocean, and that of countries situated at a considerable distance from it, there is a very perceptible difference. As the sea is never heated to the same degree as the land,
the mean temperature of summer over the sea may be considered as lower than that over the land. In winter, when the force of the sun's rays is weakened, the sea absorbs its heat to the atmosphere much more readily than the earth. The mean temperature on the sea, is, therefore, at this season higher than on land, and in cold countries this difference in the evolution of heat is so very considerable, that it more than counterbalances the difference which takes place in summer, so much that in high latitudes, the mean annual temperature at sea ought to exceed that on the land. Mr. Kirwan observes, that in order to find the temperatures in any place latitude between the latitudes 50° and 55°, the standard temperature for the same latitude should be lowered 1° of a degree for every 50 miles of distance; since in winter the cold always increases in proportion to the distance from the standard. At a sea distance than 50 miles the atmosphere on the ocean and land are so blended together by the agency of sea and land winds, that little difference is perceptible in the annual mean temperature. In lower latitudes than 30°, the solar rays even in winter act with no considerable force, the surface of the earth also retains a pretty considerable degree of heat, and consequently the mean annual temperature of the sea and land preserve a greater equality. In proportion as we approach to the equator, the force of the sun's rays in winter is increased with additional energy, and the mean temperature of the land atmosphere at this season approximates nearer and nearer to that of the sea, till at the equator they become equal.

In latitudes distant from the equator, islands are warmer than continents, because they participate more of the temperature of the sea. Countries that lie southward of any sea, are warmer than those that have the same sea to the south of them, at least in our hemisphere, because the winds that should cool them in winter are tempered, by passing to them from that sea; and those that are northward of the sea are cooled in summer by the breezes that arise from it; but a northern or southern bearing of the sea renders a country warmer, than if it lay either to the east or west. Tracts of land which are covered with trees and luxuriant vegetation, are much colder than those which have less surface of vegetable matter; for though living vegetables alter their temperature slowly, and with difficulty, yet the evaporation from their numerous surfaces is much greater than from the same space of land uncovered with vegetables; and besides, when they are tall and close, as forests, they exclude the sun's rays, and shelter the winter snows from the wind and sun. From some experiments of Mr. Williams (Philad. Trans. vol. ii. p. 150.) it appears, that forests discharge one-third more vapour into the atmosphere, than the same space of ground would do if actually covered with water. From this reasoning it appears, that woody countries are much colder than those that are open and cultivated; and it will enable us to account for the amelioration of climate that attends agricultural cultivation. See Climate.

Another principal source of heat, besides the sun's rays and earth, which may be regarded as a repository of heat, is the condensation of vapour. It is well known, that vapour contains a quantity of the matter of heat, which produces no other effect but that of making it assume an aerial expanded state, until the vapour is condensed into a liquid; but during this condensation a quantity of sensible heat is let loose, which warms the surrounding atmosphere. This condensation is frequently occasioned by the attraction of an electrical cloud; and hence we proceed the fulminets which we often experience before rain.

Vol. III.
ATMOSPHERE.

the equator is \(9^\circ\), and that of the pole \(91^\circ\). Upon these principles the following table was calculated.

TABLE of the Mean Annual Temperature of the Standard Situation in every Latitude.

</table>

In forming this table, Mr. Kirwan fought for a standard situation, with whole temperature, in every latitude, which we may compare and appreciate the temperature of all other situations in the same latitudes, on water only. Accordingly, he chose that situation for a standard, which is most free from any before the mull permanent causes of alteration, viz. that part of the Atlantic that lies between the 80th degree of northern, and the 45th degree of southern latitude, and extending westward as far as the Gulf stream, and to within a few degrees of the coast of America; and all that part of the Pacific ocean, reaching from N. lat. 45° to S. lat. 40° from the 25th to the 25th degree of longitude, call from London, which is by far the greater part of the surface of the globe. Within this space the mean annual temperature is as expressed in the table, and the author has added the temperature of latitudes beyond 80° in the northern hemisphere, though not strictly within the standard.

Mr. Kirwan has also attempted to ascertain the mean monthly temperature of the standard ocean. With this view he states, that in every latitude, the mean temperature of the month of April seems to approach very nearly to the mean annual heat of that latitude; and as far as heat depends on the action of the solar rays, the mean heat of every day is as the mean altitude of the sun, or rather, as the sine of the sun's mean altitude during that month. Hence to find the mean heat of May, say, as the sine of the sun's mean altitude in April is to the mean heat of April, so is the sine of the sun's mean altitude in May to the mean heat of May. By a similar process, the temperatures of June, July, August may be found; but this rule would give the temperatures of the succeeding months too low; because it does not comprehend the quantity of heat accruing to the atmosphere by communication of the internal heat of the globe, which in every latitude is nearly the same as the mean annual heat of that latitude. Hence the real temperature of those months must be regarded as an arithmetical mean between the astronomical and terrestrial heats. E. g.

In lat. 51°, the astronomical heat of the month of September is 44.06, and the mean annual heat is 52.3°; consequently the real heat of this month is

\[\frac{44.06 + 52.3}{2} = 48.4\]

which is more conformable to observation. Mr. Kirwan has with great labour formed a table, showing the monthly mean temperature of the standard ocean from lat. 80°, to lat. 10°. Hence he shows, that the coldest weather in all climates prevails in the month of January; and that July is the warmest month in all latitudes above 48°; but in lower latitudes, August is generally the warmest; that December and January, and also June and July, differ but little; that the differences between the hottest and coldest months, within 20° of the equator, are inconsiderable, and that they increase as we recede from the equator; that in the highest latitudes we often meet with a heat of 75° or 80 degrees; that every habitable latitude enjoys for two months a heat of 60 degrees at least, which seems to be necessary for the growth and maturity of corn; and that the quickness of vegetation in the higher latitudes proceeds from the duration of the sun’s above the horizon; that as the cold of the higher latitudes, and the heat of the lower, are moderated by the vicinity of seas and mountains, these, instead of being irregular and fortuitous, may be regarded as a wife and beneficial provision of nature, in this respect as well as in many others. Mr. Kirwan has also shown, that the greatest cold within the twenty-four hours generally happens half an hour before sun-rise, in all latitudes; the greatest heat in all latitudes between 60° and 45° is found about half past two o'clock in the afternoon; between lat. 45° and 35°, at two o'clock; between lat. 35° and 25°, at half past one; and between lat. 25° and the equator, at one o'clock. On sea, the difference between the heat of day and night is not so great as on land, particularly in low latitudes.

The first column of this table exhibits the differences of the annual temperature; the second, that of January; and the third that of July; that of London, as the standard, being
being estimated at 1000. The degree of cold is estimated in the second column, and the degree of heat in the first and third.

</tbody>
</table>

At the earth is the chief source of heat in the ambient atmosphere, distance from the earth is a source of cold; and the greatest cold must prevail in the highest regions of the atmosphere, more especially as clear unclouded air seems to receive no heat from the rays of the sun, whether direct or reflected. Thus, if the focus of the most powerful burning glass be directed on mere air, it does not produce the smallest degree of heat, because the air being transparent, a free passage is afforded to the sun's rays. At the level of the sea, the temperature corresponds to that of the standard ocean; but as we ascend above the level, the temperature is gradually diminished; but at a certain height we arrive at the region of perpetual congelation, called by M. Bouguer the "lower term of congelation." The height of this varies according to the latitude of the climate, and at that height it continually freezes at night in every season. At the equator it is at its highest elevation; and it descends towards the earth as we advance towards the poles. On the summit of Pinchincha, one of the Cordilleras, immediately under the line, M. Bouguer found the cold to extend from 7 to 9 degrees below the freezing point every morning before sun-rise. He fixes the height of "the lower term of congelation," between the tropics, at an elevation of 15,577 feet; but in lat. 28° he thinks that it should commence, in summer, at the height of 13,450 feet from the level of the sea. At still greater heights it never freezes, not because the cold decreases, but because vapours do not ascend to high; this height is called by M. Bouguer, "the upper term of congelation," and he fixes it under the equator at the height of 28,400 feet as mid. Mr. Kirwan thinks it of importance to add to the height of both these terms. To this purpose, he observes, that under the equator the height of this is nearly constant; but under other latitudes it is variable both in summer and winter, according to the degree of heat which prevails on the surface of the earth. But as there is a mean annual temperature peculiar to each latitude, so there is a mean height for each of these terms peculiar to each latitude. And if we take the differences between the mean temperatures of every latitude and the point of congelation, it is evident that whatever proportion the difference under the equator bears to the height of either of the above terms, the same proportion will the difference peculiar to every other latitude bear to the height of those terms. Thus, the mean heat of the equator being 84°, the difference of this and 32° is 52°; and the mean heat of lat. 28° being 72° 3', the difference between this and 32° is 40° 3'. Then as 32° = 15577 : 40° 3' = 12072. In this manner Mr. Kirwan calculated the following table.

<table>
<thead>
<tr>
<th>Least height of the Lower Term of Congelation</th>
<th>Mean height of the Upper Term of Congelation</th>
<th>Mean height of the Lower Term of Congelation</th>

In this manner, the height of both terms of congelation may be calculated in every latitude for every degree of heat observed at the surface of the earth, on which it evidently depends; for when that is at 32°, the lower line of congelation must be also on the surface. Hence if the height of the lower term of congelation in any latitude be known, and also the general temperature at the surface of the earth, the decrement of heat at any lower height may be found. The heat is observed to decrease in ascending into the atmosphere nearly in an arithmetical progression; and thus, having the first and last terms, if we make so many terms in the progression as there are hundreds of feet in the distance of the line of congelation, we shall be able to determine the decrement.
ment at each term. Let \( L \) = the entire decrement or difference between the heat at the surface and \( 32^\circ \); \( D \) = the distance of the lower line of congelation, in feet; \( n \) = the number of terms = \( D \times n \); \( d \) = the first decrement = \( L \times n \) and \( R \) = the rank of any given term, whose decrement is required.

Then the decrement at any given term is \( = R \times d \); and, substituting this for the heat at the surface, we have the heat at each given height. The temperature at the upper term of congelation may be investigated in the same manner, or that of any other height in the atmosphere, except over mountains; for the air over mountains is generally warmer than air of the same height over the sea or over plains.

Sometimes the temperature of the upper air is higher than that of the lower, particularly when a large mass of vapour is condensed by electrical agency. For no part of the heat given out by that cause being lost by communication with air much colder, that which surrounds the condensed vapour must be heated to a considerable degree. Air, rendered opaque by clouds, traumatizes left, and absorbs more light, and is therefore more heated than clear air. Sometimes winds, in opposite directions, and different temperatures, flow at different heights, the uppermost being often the warmest; all which circumstances, especially in cloudy weather, render all calculations of the height of the terms of congelation on any particular day precarious, though when they regard a particular month or season, they may be sufficiently exact.

With regard to the effect of elevation on the temperature of the atmosphere, we may observe, that as heat is propagated through the atmosphere, chiefly by contact and communication with the earth, lofty mountains of limited surface cannot warm it to any considerable degree, as they receive the sun's rays more obliquely, and communicating left with the common mass of the earth, are less heated than plains. Hence it happens that the steepest mountains are always the coldest. Indeed, the coldness of the atmosphere on the tops of mountains has been ascribed, by M. Lambert and M. De Luc, to the greater rarity of the igneous fluid, or elementary fire, in such elevated situations, than on the plains. M. Lambert is of opinion, that it is raised above by the action of the air, and that it is condensed below by its own weight. Without absolutely deciding the question, his friends inclined to admit the idea of the rarity of fire and light. M. De Luc compares elementary fire to a continuous fluid, whose parts are condened by being mutually compressed: and though he denies that fire and light are the same, yet he supposes that light puts into motion the igneous fluid contained in bodies, and that it acts with greater force near the earth than at a distance from its surface, by means of this fluid, which he calls an heavy and elastic one, by being more condensed there than at a greater height.

M. Bouger has demonstrated, by simple and obvious principles and facts, that in order to account for the diminution of heat on mountains, it is unnecessary to recur to dubious hypothesis. In his account of what was experienced on the mountains of Peru, he says, "it was proper, in order to explain this subject, to infall on the shorter duration of the sun's rays, which cannot alight the different sides of mountains but for a few hours, and even this not always. A horizontal plain, when the sun is clear, is exposed at mid-day to the perpendicular and uniminished action of these rays, while they fall but obliquely on a plain not much inclined, or on the sides of a high pile of steep rocks. But let us conceive for a moment an infalluted point, half the height of the atmosphere, at a distance from all mountains as well as from the clouds which float in the air. The more a medium is transparent, the less heat it ought to receive by the immediate action of the sun. The free passage which a very transparent body allows to the rays of light, shows that its small particles are hardly touched by them. Indeed what impression could they make on it, when they pass through almost without obstruction? Light, when it consists of parallel rays, does not, by falling through a foot of free atmospheric air, near the earth, lose an hundred thousandth part of its force. From this we may judge how few rays are weakened, or can act on this fluid, in their passage through a stratum of the diameter, not of an inch or line, but of a particle.

Yet the subtlety and transparency are still greater at great heights, as was obvious on the Cordilleras, when we looked at distant objects. Lastly, the greater air is heated below by the contact or neighbourhood of bodies of greater density than itself, which work, and on which it rests; and the heat may be communicated by little and little to a certain distance. The interior parts of the atmosphere by this means contract daily a very considerable degree of heat, and may receive it in proportion to its density or bulk. But it is evident that the same thing cannot happen at the distance of a league and an half or two leagues above the surface of the earth, although the light there may be something more active. The air and the wind therefore must act very cold in the upper parts of the atmosphere, and the height must be extremely cold, and colder in proportion to the elevation."

This theory is adopted by Sauflure, who has superadded the following fact to prove, that the force of the sun's rays, considered abstrafedly and independently of any extrinsic source of cold, is not less powerful on mountains than in plains; viz. that the power of burning leaves and mirrors is the same at all heights. For ascertaining this fact, he procured a burning-glass, so weak in its effect, that at Geneva it would just set fire to tinder. This glass was carried to the summit of Mount Saleve, 3000 feet high, and it there produced the same effect, and even with greater ease. Hence he concluded, that the principal source of cold on the tops of mountains is their being perpetually surrounded by an atmosphere, which cannot be much heated by the rays of the sun, in account of its transparency, or by their reflection from the earth, by reason of its distance; but he wished also to know, whether the direct solar rays had the same power on the top of a high mountain as on the plain below, whilst the body on which they acted was placed in such a manner as to be unaffected by the surrounding air. With this view he instituted a fort of experiments, from which he deduced the following conclusions; viz. that a difference of 777 toises in height diminishes the heat which the rays of the sun are able to communicate to a body exposed to the external air, 14° of the thermometer; that it diminishes the heat of a body partially exposed, only 6°; and that it augments by 1° the heat of a third body completely defended from the air. Hence it appears, that the atmosphere counteracts the operation of the solar rays in producing heat, by a power which is exerted at all distances, from the surface to the higher regions. From the experiments of M. Picquet, to this purpose, it is inferred, that even in places exposed to the rays of the sun, the heat at five feet from the ground is greater only by \( 1° - 2° \) than at fifty feet above the surface, although the ground was at that time \( 15° \) or \( 20° \) warmer than the air immediately in contact with it. This difference, however, small as it is, does not obtain in higher regions; for if it did, the cold in the top of the mountain of Saleve, 3000 feet above the lake of Geneva, would be \( 60° \) greater than at the foot of it; whereas it really is only \( 10° \). In the night the case is reversed; for the flattened air, at
five feet from the ground, was found by M. Pitot to be
colder than that at 50°. Besides, different itarata are found
to poole very different and variable degrees of cold, without
any regard to the altitude or depression of their situation.
In 1780, Dr. Wilton of Glasgow (Phil. Trans. for 1780,
p. 467; and for 1781, p. 308.) found a remarkable cold close
to the surface of the ground; so that the thermometer, when
lain on the surface of the snow and hoar-frost, sunk many de-
ger lower than one suspended twenty-four feet above it.
Hence it has been concluded, that snow, falling from the
higher regions of the atmosphere, is generally colder than the
lower air.

With respect to the precise effect of elevation, Mr. Kirwan
found it to be nearly as follows: when the elevation is mo-
 moderate and gradual, such as that of the interior parts of
most countries very distant from the sea, its effects are
blended with those of distance from the standard ocean, that
the same allowance in the diminution of temperature is to
be made for both. By a gradual elevation, he means such
as rises at a rate per mile, by which the mean annual tem-
perature of the standard must be diminished in that lati-
tude, as follows:

If the elevation be at the rate of
6 feet per mile - - - - 4 of a degree.
7 feet - - - - 1
13 feet - - - - 1
15 feet, or upwards - - - - 1/2

For every 50 miles distant from the standard ocean, the
mean annual temperature in different latitudes must be de-
preficed or prefixed, nearly at the following rate:
From lat. 70° to lat. 35° cooled, 1/2 of a degree.
35° - - - - 2
30° - - - - 2
25° warmed - - - - 1
20° - - - - 1
10° - - - - 1

See on this subject Kirwan’s Estimate of the Temperature of
different Latitudes, 1787, p. 331.

It has been observed, that in clear weather, though the
surface of the earth be then most liable to be heated by the
sun, yet after sun-set, and during the night, the air is coldest
near the ground, and particularly in the vallies. The ex-
periments made on this subject for a whole year, by Mr. James
Six, may be seen in the seventy-eighth volume of the Phi-
thosophical Transactions, but our limits will not allow our re-
citing them. The conclusions deduced from them are thse
that a greater diminution of heat frequently takes place
near the earth in the night-time, than at any altitude in
the atmosphere within the limits of the writer’s inquiry;
that is, 220 feet from the ground; and that at six times the
greatest degrees of cold are always met with nearest the sur-
face of the earth. This is a constant operation of nature, un-
der certain circumstances of the atmosphere, and occurs at
all seasons of the year; and this difference never happens in
any considerable degree, except when the air is still, and the
sky perfectly unclouded. The refrigeration was not at all
impeded, but rather promoted, by the moist hot vapour, as
dews and fogs. In very severe frosts, when the air fre-
cquently departs a quantity of frozen vapour, it is commonly
found greates t; but the excefs of heat, which in the day was
found in the lowest altitude in summer, was diminished in
winter almost to nothing. The fact of the mercury’s sink-
ing in a thermometer, included in a receiver, when the air
begins to be rarefied, has been usually attributed, not to any
degree of cold thus produced, but to the sudden expansion of
the bulb of the thermometer, in consequence of the removal
of the atmospheric pressure; but from some experiments of
Dr. Darwin (see Philos. Trans. vol. 78, p. 45 &c.) it ap-
ppears, that the atmosphere always becomes warm by con-
traction, and cold by dilatation from a compressed state. This
ingenious author mentions a curious phenomenon observed in
the fountain of Hiero, contrived on a very large scale in
the Cheminons, mentioned by Longuet in Hungary. In this machine
the air, in a large vessel, is compressed by a column of water 260
feet high; a stop-cock is then opened; and as the air flites
out with great violence, and in consequence of its previous
condensation becomes immediately much expanded, the
moisture contained in it is not only precipitated, as in the ex-
hauled receiver, but falls down in a shower of snow, with i-
ches adhering to the noed of the cock. See Phi. Trans. for
1761, vol. 52. From this phenomenon, as well as from his ex-
periments, Dr. Darwin infers, that there is good reason for
concluding, that in all circumstances where air is mechani-
ically expanded, it becomes capable of attracting the fluid
matter of heat from other bodies in contact with it. (See Ca-
loric.) Now (says he,) as the vault region of air
which surrounds our globe is perpetually moving along its
surface, climbing up the fides of mountains, and descending
into the vallies; as it passes along, it must be perpetually ex-
duced, its degree of heath, according to the elevation of the
mountain it traverses for; in rising to the summits of moun-
tains, it becomes expanded, having so much of the pressure
of the superincumbent air taken away; and when thus
expanded, it attracts or absorbs heat from the mountains in
contiguity with it; and, when it descends into the vallies,
and is again compressed into its compact state, it again gives
out the heat it has acquired to the bodies it becomes in contact
with. The same thing must happen in respect to the higher
regions of the atmosphere, which are regions of perpetual frigid,
as has lately been discovered by the aereal navigators. When
large districts of air, from the lower parts of the atmosphere,
are raised two or three miles high, they become so much ex-
panded by the great diminution of the pressure over them,
and thence become so cold, that hail or snow is produced by
the precipitation of the vapour: and as there is, in these
high regions of the atmosphere, nothing else for the ex-
panded air to acquire heat from after it is actuated with its
vapour, the same degree of cold continues, till the air, on
descending to the earth, acquires its former state of con-
densation and of warmth.

The Andes, shrouded under the line, rest its base on burn-
ing sands; about its middle height is a moat pleasant
and temperate climate covering an extensive plain, on which is
built the city of Quito; while its forehead is encircled with
eternal snow, perhaps coeval with the mountain. Yet, ac-
cording to the accounts of Don Ulloa, these three dif-
cordant climates seldom encroach much on each other’s
territory. The hot winds below, if they ascend, become
cooled by their expansion; and hence they cannot affect the
snow upon the summit; and the cold winds, that sweep the
summit, become condensed as they descend, and of tempe-
rate warmth before they reach the fertile plains of

Quito. The temperature of the atmosphere, and the vicissitudes
of its heat and cold, are subject to a variety of irregularities,
which no theory that has yet been proposed is altogether
sufficient to explain. For other observations on this subject,
see the articles Clouds, Cold, Congelation, Evapora-
tion, Hail, Heat, Hygrometer, Meteorology, Rain, Snow,
Weather, Wind, &c.

Atmosphere, Uses of the. These are so numerous and
various, that it would require a very minute and extended
detail
detail to recite even the principal of them. Of its indis-
penible necessity to the existence of animal and vegetable 
life, instances frequently occur in the course of this work.
Animals and vegetables, in their immense variety, and from 
their state of eggs and seeds to their full growths, owe 
the commencement and continuance of their being to the 
atmosphere that surrounds them. How much it conduces 
to the fertility of the earth, by means of the parts that 
compose it, and to the convenience and comfort of man-
kind, by furnishing a fit repository for the vapours that 
defend in refreshing showers, and for the winds that form 
an intercours of society and commerce with distant nations, 
and by affording those reflections and refractions of light 
which shed lustre over surrounding objects, and which form 
pleasing transitions from darkness to day, and from day to 
night, by means of twilight, it is altogether needless to 
specify. The subject would afford scope for much declama-
tion; and we might derive from it arguments that would 
impress a thoughtful mind with just and honourable senti-
ments of the creator. How necessary it is to the various 
operations of arts and science, as well as to the common 
purposes of life, will amply appear under the several articles 
in which it would be almost superfluous to mention. See 
Air, and the several articles to which we have already 
referred.

Atmosphere. Method of navigating in the. See Aero-
station.

Atmosphere of the Sun, Moon, Planets, and Comets. See 
the several articles.

Atmosphere of solid or constrict Bodies, is a kind of 
sphere formed by the effluvia, or minute corpuscles emitted 
from them. Mr. Boyle endeavours to show that all bodies, 
even the hardest and most coherent, as gems, &c. have their 
atmospheres. See Gem.

Atmosphere, in Electricity, denotes that medium which 
was conceived to be diffused over the surface of electrified 
bodies, and to consist of effluvia issuing from them: where-
by other bodies immersed in it become endowed with an 
electricity contrary to that of the body to which the atmosphere 
belongs. This was first taken notice of at a very early period 
in the history of this science, by Otto Guericke, and after-
wards by the academicians del Cimento, who contrived to 
render the electric atmosphere visible, by means of smoke 
attracted by, and uniting itself to, a piece of amber, and 
gently raising it, and vanishing as the amber cooled.

But Dr. Franklin exhibited this electric atmosphere with 
great advantage, by dropping rain on hot iron plates held 
under bodies electrified, from which the smoke rose and 
encumbered the bodies, giving them a very beautiful ap-
pearance. He made other observations on these atmos-
pheres; he took notice that they and the air did not seem 
to exclude one another; that they were immovably re-
tained by the bodies from which they issued; and that the 
same body, in different circumstances of dilution and con-
traction, is capable of receiving or retaining more or less of 
the electric fluid on its surface. However, the theory 
of electrical atmospheres was not sufficiently explained and 
understood for a considerable time; and the investigation 
led to many very curious experiments and observations. 
Mr. Canton took the lead, and was followed by Dr. Frank-
lin; Meff. Wilcke and Epinus prosecuted the inquiry, and 
completed the discovery. The experiments of the two 
former gentlemen prepared the way for the conclusion 
that was afterwards drawn from them by the latter, though 
they retained the common opinion of electric atmospheres, 
and endeavoured to explain the phenomena by it. The 
conclusion was, that the electric fluid, when there is a re-
dundancy of it in any body, repels the electric fluid in any 
other body, when they are brought within the sphere of 
each others influence, and drives it into the remote parts of 
the body, or quite out of it, if there be any outlet for that 
propulsion.

But atmosphere, M. Epinus says, no more is to be un-
derstood than the sphere of action belonging to any body, 
or the neighbouring air electrified by it. Sir. Becaaria 
concurs in the same opinion, that electrified bodies have no 
other atmosphere than the electricity communicated to the 
neighbouring air, and which goes with the air, and not 
with the electrified bodies. And Mr. Canton likewise, 
having relinquished the opinion that electrical atmospheres 
were composed of effluvia from excited or electrified bodies, 
maintained that they only result from an alteration in the 
fute of the electric fluid contained in, or belonging to, 
the air surrounding these bodies to a certain distance; for in-
fance, that excited gases repels the electric fluid from it, 
and consequently beyond that distance makes it more dense; 
wheras excited wax attracts the electric fluid existing in 
the air nearer to it, making it rarer than it was before. 
In the course of experiments that were performed on this 
occasion, Meff. Wilcke and Epinus succeeded in charging 
a plate of air, by suspending large boards of wood covered 
tin, with the flat sides parallel to one another, and at 
some inches asunder; for they found, that, upon electrify-
ing one of the boards positively, the other was always 
negative; and a shock was produced by forming a com-
nunication between the upper and lower plates. Becaaria 
has largely considered the subject of electric atmospheres, 
in his Artificial Electricity, p. 179, &c. Eng. edit. Dr. 
Priddle's Hist. of Electricity, vol. ii. sect. 5. Cavallo's 
Electricity, vol. i. p. 241. vol. iii. p. 282. See Condenser, 
and Conductor, Luminous; and Experiments in Elec-
tricity.

Atmosphere, Magnetics, denotes the sphere within which 
the virtue of the magnet, &c, acts.

Atmospheral Logarithm. See Logarithm.

ATNAH, or Carrier Indians, in Geography, a tribe of 
Indians in the north-west continent of America, inhabiting 
the banks of the Columbia river, south of the Nagali-
Indians, about N. lat. 52, and W. long. 122. The 
Atnah language, of which Mr. Mackenzie obtained some 
facimens, has no affinity to any with which he was acquainted. 
Mackenzie's Journal of a Voyage through the N. W. Con-
tinent of America, p. 258.

ATOM, formed of the privative a, and τμος, I divide, in 
Philosophy, a part or particle of matter, so minute as to be 
indivisible.

Atoms are properly the minima nature, the last ultimate 
particles into which bodies are divisible; and are conceived 
as the first rudiments, or component parts of all physical 
magnitudes; or the pre-existing and incorruptible matter 
whereof bodies were formed.

The notion of atoms arises hence, that matter is not di-
visible in infinitum. And hence the Peripatetics are led to deny 
the reality of atoms, together with that of mathematical 
points: an atom, say they, either has parts, or it has none; 
if it hath none, it is a mere mathematical point; if it 
hath, then do these parts also confit of others, and so on 
infinity.

But this is to recede from the genuine character of atoms, 
which are not effaced indivisible, because of their want of 
dimensions, or parts (for all physical magnitude must have 
three dimensions, length, breadth, and thickness, and all ex-
tension is divisible); but they are indivisible on account of their si-
licity, hardness, and impenetrability, which preclude all di-

As atoms are the first matter, it is necessary they should be indivisible, in order to their being incorruptible. Sir Isaac Newton adds, that it is also required they be immutable, in order to the world's continuing in the same state, and bodies being of the same nature now as formerly. To this purpose he observes, at the close of his inquiry into the nature, laws, and constitution of matter, that God in the beginning created matter in solid, massy, hard, impenetrable, moveable particles, incomparably harder than any of the porous bodies composed of them; nor, so far as never to wear or break in pieces; no human power being able to divide what God made one at the creation, while these particles continue entire, they may compose bodies of one and the same texture in all ages; but if they should wear away or break in pieces, the nature of things depending upon them would be changed. See Divisibility, and Solidity.

Hence the ancients were also led to maintain atoms eternal: because what is immutable, must be eternal. They also added gravity; and, in consequence thereof, motion to their atoms: and further observing that atoms thus falling perpendicularly, could not join or unite together; they superadded a fortuitous or slide motion, and furnished them with certain hooked parts, in order to enable them to catch and hang the better together. —And from a casual and fortuitous jumble of these atoms, they supposèd the whole universe to be formed.

**ATOMARIA**, in Zoology, a species of Cypris, about half an inch in length. This shell is oblong, fowtry-white, dotted with brown, and at each end two dusky marks. Marius, Gmel. &c.

**ATOMARIA**, a genus of Conus (Myopa, Fabr.), found in Europe. It is greyish, with an ovate abdomen; wings brown, crowded with white dots. Gmelin.

**ATOMARIA**, a species of Phalæna found in Germany. The wings are pale-grey, with numerous black dots.

**ATOMARIA**, a species of Phalæna (Geminas) that inhabits Europe. The wings are entirely yellowish, streaked and speckled with brown. Gmelin, &c. This is Phalæna penna of Scopoli, and Phalæna artemisia of Thaus. Schmett., is supposed to be a variety of this species by Gmelin. The larva from which this moth is produced is smooth and greyish, with numerous fuggungous interrupted lines, and two evercles on the posterior part; feeds on centaurea scabiosa.

**ATOMARIA**, a species of Notonecæ, about the size of a louse, and inhabits the river Volchova in Russia. It is white; above and wing-cases pale-greyish; wings milky, Pallus, &c.

**ATOMARIA**, a species of Silphæ, (Sphæridium Fabr.) This insect is smooth and black; wing-cases marked with crenate frize; legs pale. Fabr. Gmel. &c. A native of Europe.

**ATOMARIA**, a species of Scarabæus (Melolontha) that inhabits the Cape of Good Hope. In size and appearance this insect resembles S. farniosus. It is powdered with white; thorax ciliated; and black wing-cases brown; abdomen white, with lateral black dots.

**ATOMARIA**, a species of Cerculo found in Europe. This insect is brown; wing-cases frilled, with the interlises smooth, finely punctated, and spiralled with specks of greyish brown hairs; shanks rufous. Muf. Lee., p. 18, n. 380. Lin. Another cerculo atomarum occurs in Linn. Muf. Lee., p. 19, 399, and which does not seem to differ specifically from the foregoing: C. atomarum fuscus, rhystris ferruginei; atoms grisei pilati.

**ATOMARIA**, a species of Carabus that inhabits Europe. It is paterapus, black, and glabrous; wing-cases rather smooth, with minute, scattered, confluent drops of a purple colour; margin purple. Muf. Lee.

**ATOMARIA**, a species of Cynex (Rotundulis, &c.), varied with griscous and brown; wings white, dotted with brown. Fabricius.

**ATOMELIA**, a species of Phalæna (Tineæ). The antennæ are of a moderate length; first wing yellowish, speckled with ferruginous; two ferruginosus dots in the disk, and a yellow marginal spot. Linun. &c. Inhabits Europe.

**ATOMICAL PHILOSOPHY**, denotes the doctrine of atoms; or a method of accounting for the origin and formation of all things, from the supposition of atoms, endowed with gravity and motion.

The atomic physiology, according to the account given of it by Dr. Cudworth (Intelligence System, b. i. vol. i. p. 7. Birch's ed.), supposes —that body is nothing else but absoluta systema, that is, extended bulk; and resolves therefore, that nothing is to be attributed to it, but what is included in the nature and idea of it, viz. more or less magnitude, with divisibility into parts, figure, and position, together with motion or rest, but so as that no part of body can ever move itself, but is always moved by something else. And consequently it supposes, that there is no need of any thing beside the simple elements of magnitude, figure, fite, and motion, which are all equally intelligible as different modes of extended substance, to solve the corporeal phenomena by; and therefore, not of any subfubstantial forms, distinct from the matter, nor of any other qualities really existing in the bodies without, besides the reffults or aggregates of those simple elements, and the disposition of the insensible parts of bodies in respect of figure, fite, and motion; nor of any intentional species or fheus, propagated from the objects to our fenses; nor bly, of any other kind of motion or action really distinct from local motion, such as generation and alteration, they being neither intelligible as modes of extended substance, nor any ways necessar'y. For a fform and qualities of bodies may well be conceived to be nothing but the reffult of those simple elements of magnitude, figure, fite, and motion, variously combined together, in the fame manner as fyllables and words, in great variety; reffult from the different combination of combinations of a few letters, or the simple elements of speech; and the corporeal part of fensation, and particularly that of vision, may be folved only by local motion of bodies, that is, either by corporeal effufion (called fumulation, membranes, and exuvia), breathing continually from the surface of the objects, or rather, as the latter and more refined anatomists conceived, by preffure made from the object to the eye, by means of light in the medium. So that we fee effusio to vim and by effusio to vim; the leaf taking cognizance of the object by the fubtle interposed medium, that is, signifies; and fhalte, (thrusting every way from it upon the optic nerves), deth by that as it were by a flaff touch it. Again, generation and corruption may be fufficiently explained by confequence and fection, or local motion, without fubfubstantial forms and quantities. And, bly, there are fimple ideas of light and colours, heat and cold, fweet and bitter, as they are diffent things from the figure, fite, and motion of the insensible parts of bodies, feem plainly to be nothing else but our own fancies, passions, and fensation, however they be vulgarly mistaken for qualities in the bodies without us."

As to the origin and history of this atomical philosophy, Dr. Cud-
Dr. Cudworth observes, that though adopted by Epicurus, it has been commonly ascribed to Democritus, who was prior both to Aristotle and Plato; but Laeritus represents Leucippus, who was somewhat senior to Democritus, as the first inventor of it. Aristotle, who often mentions this philosophy, commonly ascribes it to Leucippus and Democritus jointly. Plato refers its origin to Protagoras, who was an auditor of Democritus. "However," says the learned Cudworth (Hist. Phil. p. 12), "we are of opinion that neither Democritus, nor Protagoras, nor Leucippus, was the first inventor of this philosophy; and our reason is, because they were all three of them atheists (though Protagoras alone was banished for that crime by the Athenians); and we cannot think that any atheists could be the inventors of it; and much less that it was the genuine frame and bond of atheism itself, as some assert, because however their atheism adopted it for themselves, endeavouring to force their tunes of it, yet if rightly understood, it is the most effectual engine against atheism that can be." This learned writer also gives historical probability for the opinion that this philosophy was much more ancient than either Democritus or Leucippus. To this purpose he observes, that Posidonius, as we learn from Empiricus and Strabo, avowed it for an old tradition, that the first inventor of this atomical philosophy was one Mofheus, a Phcenician, who, according to Strabo, lived before the Trojan war, and who has been supposèd by some persons to have been the same with Moses the Jewish lawgiver. See Moses.

Dr. Cudworth further maintains, that Pythagoras, who is thought to have conversed at Sidon with the Jewish philosophers, priests, and poets, who were the succecors of Moses, to have borrowed many things from the Jews, and to have translated them into his philosophy, was not acquainted with the atomical philosophy, and he therefore concludes, that the philosophy of Democritus was Pythagorean; and the philosophy of Pythagoras, DemOCRITIC or atomical. Accordingly, he alleges the authority of Epicurus, a famous Pythagorean, and other testimonies, to prove that the Monads of Pythagoras were nothing else but corporeal atoms. In order to reconcile Aristotle with himself, and to preserve the credit of Laeritus, both of whom ascribe this philosophy to Democritus and Leucippus, as its first authors, Cudworth suggests, that though the atomical philosophy was in use long before Democritus and Leucippus, yet those two with their confederate atheists, of whom Protagoras seems to have been one, were under the influence of the first, that ever made this philosophy to be a complete and entire philosophy by itself, so as to derive the original of all things as the whole universe from senseless atoms, that had nothing but figure and motion, together with vacuum, and made up a syltem of it, as from which it would follow there could not be any God, not so much a corporeal one. The atomical philosophy, according to this learned writer, existed before and without atheism; and Democritus and Leucippus are to be regarded as the first inventors or founders of the atomical philosophy. "Atheized and adulterated." Consequently there have been two sorts of atomists in the world; the one atheistical, the other religious. The first and most ancient atomists, holding incorporeal substance, used that philosophy in a way of subordination to theology and metaphysics. The others, allowing no other substance but body, made senseless atoms and figures, without any mind and understanding, (i.e. without any God) to be the original of all things; which latter is that, which was vulgarly known by the name of atomical philosophy, of which Democritus and Leucippus were the fource. Dr. Cudworth has shown, by a variety of citations from ancient writers, that the atomists before Democritus did generally join theology and incorporealism with their atomical philosophy; and he has also proved by the most conclusive reasoning, that atheism, so far from being a natural and necessary appendage to atomism, is totally different from it; that there is, neither in reason nor in fact, any inconsistency between the atomical philosophy and theology; and that there is, on the contrary, a most natural cognition or alliance between them. Ubri supr., p. 27, sq. The atomic philosophy of Democritus and Leucippus was cultivated and improved by Epicurus, though he would not acknowledge that he had borrowed his hypothesis from any; and from him it obtained the denomination of the Epicurean philosophy. See the articles DEMOCRITUS, LEUCIPPUS, EPICURUS, AND EPICUREAN PHILOsOPHY. See also COSMOLOGY.

The opinion of Dr. Cudworth with respect to the antiquity of the atomic philosophy has been contested by some later writers. The learned bishop Warburton, in his "Divine Legation of Mofes," admits it as a settled point, that Democritus and Leucippus were the authors of this philosophy; and Brucker "Hist. Philos. de Anfil., vol. i. p. 63") thinks, that the single evidence of Porphyrion, the Roman, who lived so many ages after the time of Mofes, to whom Cicero allows little credit, and of whose authority Strabo and Sextus Empiricus, who refer to him, intimate some fulification, is too feeble to support the whole weight of this opinion. But the circumstance, says this writer, which most of all invalidates it, is, that the method of philosophizing by hypothesis or syltem, which was followed by the Greek philosophers, was inconsistent with the genius and character of the barbaric philosophy, which consisted in simple assertion, and relied entirely upon traditional authority. He adds, that the part of the history of Pythagoras which relates to this subject, has been involved in obscurity by the later Platonists; and that neither the doctrine of monads, nor any of those systems which are said to have been derived from Mofes, are the same with the atomic doctrine of Epicurus. He therefore concludes, that, whatever credit the corporeal syfltem may derive from other sources, it has no claim to be considered as the ancient doctrine of the Phcenicians. We decline however to admit the testimonies and arguments of Dr. Cudworth; and with the distinction which he has adopted between the atomic philosophy derived from tradition before the time of Democritus and Leucippus, and that syltem of materiaism and atheism connected with it by their speculations, and with this re-branch annexed to it transmitted to Epicurus and his followers, by whom it was again modified, it seems most probable, that the atomic philosophy was not first invented by their speculative philosophers, but derived by tradition from Phoenicia or Egypt. The atomic philosophy has been revived by some moderns, and particularly by Gassendi and others, who, rejecting the eternity of atoms and their fortuitous motion, have made it a very intelligible and rational syltem. It is now eloped and adhered to by a great part of the philosophical world, under the denomination of the CORPUSCULAR PHILOSOPHY; which see. It is the philosophy of Newton, Locke, and all their followers; and it claims regard, among other considerations, from its being the genuine philosophy of the first and most ancient atomists. The scholatic divines among the Mahometans, who are very orthodox as to the creation of the world by God, do also admit both atoms and a vacuum; but their atoms are different from those of Leucippus, for they have no magnitude and are all like one another: and they suppose, as that philosopher ought to have done, that every atom of a living body is alive, that every atom of a sensitive body is endowed
died with sense, and that the understanding resides in anatomy; though they differ as to the soul and knowledge, whether they consist in a 'spiritual atom,' or a collection of several Maimon, in More Neoechim, c. 73.

The atomic system, adopted by modern philosophers, and extended by Le Sage and De Lave to great subtilities, supposes that matter fills its space merely by its existence; that it is absolutely imperceptible; that its division can be carried to a certain length only, ending in atoms, which, though extended, are not further divisible; that there are empty interstices between the atoms; that the particles of elastic fluids, as air, vapours, caloric, &c. do not touch each other, and consequently they form different fluids, as they are called; and that the rarity or density of a body depends fully on the quantity of empty interstices, in a certain volume of space occupied by the matter constituting that body. In these respects, the ancient system is opposed to that denominated the dynamic system, illustrated by Kant in his 'Metaphysical Elements of Natural Philosophy.' See Dynamic System.

A late writer has distinguished between common, and philosophic atoms. Under the former appellation he comprehends those who think with the vulgar, not only that matter exists externally, but that it really pos sesses all those properties which attract the senses; such as cold, heat, colour, sound, &c. Under the general name of philosophic atoms, he comprehends all those philosophers, who admit the essential properties of matter, such as extension, imperceptibility, cohesion, and mobility, and who reject the real or external existence of those properties that are called sensible qualities. These latter atoms he further distinguishes into two classes: viz., simple and mixed: simple or pure atoms acknowledge extension and imperceptibility alone, and the attributes necessarily arising from these, viz. inertia and cohesion. According to them, matter is merely passive, endowed with no internal powers; and cohesion, though not necessarily contained in the idea of matter, is essential to the idea of extension; so that all changes are effected by powers foreign to matter: in nature, the power of God: in creatures, the powers of the soul. Mixed atoms, or Dynamists, place powers in matter itself, which in their opinion belong to it, and imbrue in it in such a manner that they are independent of spiritual influence, and are either formed in bodies, or superadded as attributes of material existences. Of this kind are gravity, cohesion, imperceptibility, attraction, repulsion, &c. These powers operate according to the organization of bodies. To atoms of such kinds this writer opposes the Idealists, who entertain the same opinions concerning the primary qualities of bodies, which are held by atoms concerning the secondary. As the latter maintain that no light can exist without being seen, or found without being heard, so the former affirm that neither imperceptibility nor extension can have place independently of our conceptions. This opinion, which seems to have been contemnated by Plato, is fully developed in the syllon of Berkeley. Malebranche is placed by this writer among the Idealists, as his mathematical points, constituent of extension, vanish into nothing when we attempt to analyze them. Locke, by supposing that matter may be made capable of thought, approaches to the Dynamists. Leibnitz and Wolf may be deemed Idealists, since, in reality, they allow of no material existence out of the mind; for although the notions are the occasion of our ideas, yet these ideas have nothing in common with the object. Kant, who derives no sensations from the attention of the soul to real existences, though he acknowledges that our ideas are in some other manner excited, by something existing out of the mind, is placed also under the class of Idealists; as, according to him, all our observations and determinations are founded on appearances. Of Dr. Priestly, this anonymous writer remarks, that, although he makes the soul material, he makes matter spiritual: and therefore he is ranked with the mixed atoms. See account of Prize Dissertations, by Tyrell's 'Theological Society,' vol. x. in Monthly Review Enlarged, vol. iii. p. 485, &c.

ATOMOS, in Entomology, a species of Canes, found in running water in Europe. It has four, head four, with a single flag: legs fourteen, with two oval valves on each side between the fourth and fifth pair.

ATOMUS, a species of Insecta, varied with pale and brown. This insect, Gymnophorus, inhabits Upland; is smaller than a mite, and scarcely to be distinguished except when it is in motion.

ATONEMENT, in Theology, is a term that has been variously explained and applied by divines of different opinions. However, there are three principal feades, in which, with subordinate modifications, the term has been usually understood. The first is, that which has been adopted by those who are commonly called Calvinists; and it supposes, that the death and sufferings of Jesus Christ, partaking of the divine and human nature in one person, being with respect to the former equal to the Father, were such, confirmed in their degree and value, as to be a propofe equivalent for the penalty annexed by the divine law to the transgression of those of the elect who are penitent and believing. Divine justice, it is said, required its victim, either in the fin or his finishes; Jesus became the finer; he paid the debt, and finished the demand. Others, who have not espoused the doctrine of the proper deity of Christ in the fin of the Trinitarians, or who have not contended for an absolute and exclusive equivalent to the demerit and consequent punishment of transgression, have expressed their notion of this doctrine in a manner somewhat different. Accordingly, Dr. Watts, in his 'Redeemer and Sanctifier' (see his Works, vol. iii. p. 742.), explains his sentiments in the following manner. 'By atonement for fin, I do not mean any such thing as shall in a proper and literal sense appease the wrath of God, the offended governor, which is supposed to be kindled against his sinful creatures, and shall incline his heart to mercy, which was before determined upon vengeance; for though this doctrine may be proper to the manner of men, yet this is an idea or fooposition in many respects inconsistent with the attributes and actions of the blessed God, and with the doctrine of the New Testament. In that book God represents himself as rich in mercy, and for this reason he pitied sinful creatures who had broken his law, and had deferved to die, before he had received any atonement; and therefore God himself provided and sent his own Son to become a sacrifice of atonement, and a ransom for them; he appointed him to be a sacrifice for us, the just for the unjust, ied to suffer death in the room and stead of sinners. By the words 'atonement,' or 'propitiation,' I mean therefore some total or painful thing done or suffered, or both, by Jesus Christ the Son of God, in the room and stead of sinful men, as a payment or punishment on account of their faults; and this by the wise and righteous appointment of God, the universal governor, shall excuse the penitent offender from the punishment that was due, and obtain his pardon, because it shall give a recompence to the authority of the divine lawgiver for the affront which was put upon him by the sins of men, and shall make some reparation of honour to his holy law which was broken. And this is not only intended to manifest the evil nature and the defect of sin, together with God's L I hatred
Atonement.

Instead of it; but it shall also answer the demand and design of the threatening by such actual pain or punishment, though it is hid on the face of it unless the offender has been punished. Such a pain, penance, or punishment, are the humiliation and sufferings of Jesus Christ, his labours and losses; and it is in this sense that the language of expiration or atonement, of punishment and atonement, is so often used. See Rom. iii. 24–25: 2 Cor. v. 21, Gal. iii. 10. "Now by these appointed sufferings of the Son of God, in the room and stead of these, there is a sufficient amendment made to the government of the world, forever to secure the lives, and a glorious means made of the greats of mercy in the pardon of the sinner, and this without any imputation of reflection upon the holiness of God's nature and conduct, or any infringement of the justice of his government, as if he would continue at this time as he discovery and declares, that in putting by the lives of his people in former ages, and in pardoning and justifying mortals who now believe in Christ, he will manifest his justice and righteousness by requiring such a sacrifice which is of course to be punished, though the sinner be punished. See Rom. iii. 24–25. To this purpose, Whitby in his notes, p. 53, observes, that Christ, after having reconciled our duty, was not by any means to be delivered from those sufferances upon which were the punishment of our sins: he being as our expiatory sacrifice, not only on the occasion of our sins, but in our stead, to bear the punishment of our iniquity. (See Satisfaction.) In the sense above expressed, the death and sufferings of Christ were properly Vicarious. The advocates for this opinion have sometimes argued, without reserve or qualification, that the necessity of an atonement arose from the immutable nature, and the indissoluble demands of divine justice: and that God could not, in confidence with his moral attributes, have pardoned sin without receiving a plenary satisfaction; that this satisfaction or atonement could not have been given by any other being but his own everlasting and equal Son; and that even he could not have effectual the great and ultimate object of his mediatorial office, unless his sons had been imputed to him in the same degree as his merits are imputed to us. (See Imputation.) On the other hand, those who have carried Calvinist to the extreme in other points, have nevertheless maintained, that punitive justice was not essential to the divine nature, and that God might have pardoned sin by virtue of his own absolute authority, independently of an atonement. Dr. Owen, however, has opposed this tenet in a Latin tract, intituled, "Distrae de justitiae divina." "Christ's death," says the learned biblical writer, Dr. Clarke (Sermons, vol. viii. p. 366.), "was truly and properly, in the strictest meaning of the word, an expiatory sacrifice. For if sinners, by having diminished the honour, and defiled the authority of God's laws, were become liable to the justice and vengeance of God; if the Son of God in our nature, by vindicating the honour of God's laws, hath discharged this obligation, and obtained remission for us: and if the obtaining this remission was by the shedding of his blood, which is called 'the price of our redemption' (1 Cor. vi. 20); it follows, that the wrath of God was appeased by the death of Christ, and that God was graciously pleaded to accept this vicarious sufferings of his Son, in the stead of the punishment that was due to the sinner in his own person; which is the express and most proper notion of an expiatory sacrifice." To the same purpose this excellent writer observes in another place (vol. v. p. 203.), that "Christ hath vindicated the honour of God's laws, by taking upon himself the punishment of their sins who repent, and embrace the terms of the gospel. He condescended to be made sin for us, i.e. to be made a sacrifice for our sins, that we through that expiation might become subjects capable of the mercy of God. He took upon him our nature, and was clothed in flesh, partly, indeed that he might preach the will of God to mankind in a nearer and more condescending conversation with them; but principally, that he who in the form of God could not suffer, might become capable of suffering by being made in the likeness to man. He led a most innocent and spotless life, that he might indeed set us an example, that we should follow his steps; but ch. 5:8, because, as it was required that the typical sacrifices under the law should be whole and without blemish, it was necessary, that he who was to be the real expiatory sacrifice for the sins of others, should have none that needed expiation of his own. He suffered a shameful and ignominious death upon the cross, that he might indeed give us an example of patience and readiness to suffer; but the principal design of it was, that he might put away sin by the sacrifice of himself, and obtain eternal redemption for us through faith in his blood. His resurrection was the demonstration of this fact, he being accepted by God and his ascension into heaven was in order to plead the merits of his sufferings before God, and intercede for those who, according to the terms of the gospel-covenant, should be capable of receiving the gracious benefits purchased by his death." Similar sentiments of the doctrine of atonement are largely illustrated in a treatise, by Mr. M. Tomkins, who was an avowed Arian with regard to the Trinity, intituled, "Jesus Christ, the Mediator between God and Man," of which a second edition was printed in London, in 1701. This writer, having produced several passages of scripture, that speak of Christ's death as a sacrifice, and which declare him to be constituted an high-priest, and having established, as he conceives, beyond all reasonable doubt, the literal sense of those scriptures, proceeds to consider what was the notion of expiatory sacrifices and of the priestly office, under the law of Moses. (See Sacrifice.) These sacrifices, he shows, were intended to make atonement for the person who offered them; i.e. according to his statement they were, by divine appointment, of avail to free him from the guilt he had contracted, and to prevent the punishments to which he was liable. See Numb. viii. 19. xvi. 46. These sacrifices he considers as a proper expiation, or a real propitiation; not that they were the cause of a merciful disposition in God, and in that sense rendered him propitious who was before implacable; but they were appointments for procuring pardon, and the priests by offering them obtained from the mercy of God those blemishes of which they otherwise must have been deprived. Hence he infers, that the effects attributed to the blood of Christ correspond with such effects of these legal sacrifices, and that his acting as our high-priest answers to the office of the high-priest under the law. See Heb. viii. ix. 8, 27, x. 1. He proceeds to show, that our pardon and acceptance with God, and our freedom from accut, are represented, in the New Testament, as the fruit of the sufferings of Christ not merely as an act of obedience, but as a sacrifice for sin, as a demonstration of God's displeasure against it, and of his regard to the righteous function of the original law, which denounced death to the transgressors of it. With this view, when God resolves to show mercy to sinners, he also determines that his only begotten Son, not indeed without his consent, shall suffer death, the penalty which the original law had denounced against transgressors. Thus Christ, by suffering death, prevented or warded off those effects or consequences of sin, which would otherwise have come upon mankind; and accordingly his death and
his mediation are very justly represented as the means of procuring for us the blessings of which we are made partakers. See Heb. ix. 12. 1 Cor. vi. 20. viii. 23. Rev. v. 9.

This representation of the matter gave rise to the term satisfaction, which has been generally used by writers in treating of this subject. (See Satisfaction.) This author having stated his notion of the death of Christ as an atonement for his sins, obviates the objections that have been urged against the opinion he has adopted. But we must refer for further particulars to the author's treatise, p. 155, &c. See also Chapman's Eusebius, vol. ii. ch. iv. v. vi.

The second explanation of the term atonement, which has sometimes been called the Armenian scheme, supposes that the sufferings of Jesus Christ were inconceivably better; and that the object of them was to exhibit the evil and demerit of sin, and the displeasure of God against it, who would not even forgive a sincere penitent, without thus manifesting his hatred of wickedness. This coincides, in a degree, with the illustration of this doctrine already given; it has been denounced the moderate doctrine, and has been adopted, with certain modifications, by many divines and others.

A third hypothesis relating to this subject is that of the learned Dr. John Taylor (see his "Scripture Doctrine of Atonement examined, &c. and also his "Key to the Apocryphal Writings," prefixed to his "Paraphrase," &c. on the Epistle to the Romans," ch. viii., who supposes, "that the scriptures represent the death of Christ as an act of obedience so acceptable to God, that, as the reward of it, he thought fit to grant unto mankind, corrupt and wicked, the forgiveness of sin (absolutely, in relation to antecedent bleedings; and upon condition of repentance, in relation to eternal life), and to erect a new diffusion furnished with all proper means to draw us from sin unto God, and to bring us to the possession of immortality. The blood of Christ, says this writer, or that by which he has bought or redeemed us, is his love and goodnea to men, and his obedience to God, exercised indeed through the whole of his life's humiliation in this world, but most eminently exhibited in his death. It is his complete and perfect righteousness, his humility, goodnea, and obedience unto death, which makes his blood precious in the blood and blessed name, and gives his crofs all its worth and efficacy. Obedience was the sacrifice which he offered unto God for us." "It was his righteousness, or right, kind, and benevolent action, his obedient death, or the sacrifice of his love and obedience, which made atonement for the sin of the world; so far, and in this sense, that God, on account of his goodnea and perfect obedience, so highly pleasing unto him, thought fit to grant unto mankind, whom he might in strict justice have destroyed for their general corruption and wickednesea (John iii. 17.), the forgiveness of sins, not imputing unto them their trespasses, (12 Cor. v. 19.) or those sins which were past, or which they had already committed (Rom. iii. 25.), and for which they deferred to fall under the dreadful effects of God's wrath. And not only did he forgive former trespasses to all the living and to all the penitent and obedient dead, but further he erected a glorious and perfect diffcnation of grace, exceeding any which had gone before it in means, promises, and prospects; at the head of which he set his Son, our Lord Jesus Christ, inviolate with univeral power in heaven and on earth, constituting him king and governor over the new body, which he designed to form, captain of our salvation, the high-priest of our profision, the mediator and surety of the new covenant, to judge and manage all affairs relating to our present instruction and sanctification, to raise all the dead out of their graves, and to put the obedient and faithful into possession of eternal life."—As in various instances, the writer observes, and prayers of good men were the reason of God's building pardon and making blessings upon others, how much more, according to this author, must the perfect righteousness, or obedience and goodness of the Son of God, be a reason for remitting the sins of mankind, so far as, in the nature of things, they are capable of remission, or of being atoned for. For the sins of the impenitent who finally neglect and refuse all means of reformation, cannot be atoned or forgiven.

Grace or favour, through the atonement of Christ, may be so far shown to the world, as to allow them space and means to repent; but none besides the penitent who duly improve the divine goodness and patience, can receive the benefit of eternal salvation through the atonement of Christ. The wisdom as well as the grace of this dispensation, are illustrated, when we consider, that pardon in the gospel is raised to a very high degree; and repentance is made available, not only to exempt from punishment, but also to gain a new and glorious state of being in eternal life, which is a grant of favour extended far beyond the natural value of repentance. Besides, the grant of remission of sin, and of other blessings of the gospel, through the blood of Christ, has a strong and direct tendency to promote our sanctification, and to render us penitent and obedient; and therefore this constitution must be acquiesced in as perfectly wise and beneficent." Dr. Taylor, in examining the notion of atonement above stated, and considered as the satisfying divine justice, by another's suffering the punishment due to the criminal's sin in his stead, addsuces a variety of passages pertaining to this subject, and those more especially in which the Hebrew word יָדָא, by which, or its derivatives, atonement is expreseed in the Old Testament: and though he discards the notions of the imputation of our sins to Christ, his suffering in our stead the punishment due to us, or his paying an equivalent to divine justice, yet he concludes his examination with inferring from it, that the sacrifice of Christ was, truly and properly, in the highest degree, and far beyond any other, pious and expiatory, to make atonement for, or to take away sin; not only to give us an example; not only to allure us of remission; or to procure our Lord a communion to publish the forgivenesses of sin; but moreover, to obtain that forgiveness by doing what God in his wisdom and goodness judged fit and expedient to be done in order to the forgiveness of sin; and without which he did not think it fit or expedient to forgive sin." The truly excellent bishop Butler, in delivering his sentiments on this subject (Analogy, &c. pt. ii. c. 8.), observes, "that some have endeavoured to explain the efficacy of what Christ has done and suffered for us beyond what the scripture has authorized; others, probably, because they could not explain it, have been for taking it away, and confining his office as redeemer of the world to his instruction, example, and government of the church. Whereas the doctrine of the gospel appears to be, not only that he taught the efficacy of repentance, but rendered it of the efficacy which it is by what he did and suffered for us; that he obtained for us the benefit of having our repentance accepted to eternal life, &c. How and in what way it had this particular efficacy, there are not wanting persons who have endeavoured to explain; but we do not find that the scriptures have explained it. It is our wisdom thankfully to accept the benefit, without disputing how it was procured." To the same purpose, Dr. Price, who formed his sentiments very much on the general plan of Butler's Analogy, lays, in his "Sermons on the Christian Doctrine," p. 85: that Christ fenced to this earth from a state of
pre-existent dignity; and that, after having passed through human life, enduring all its sorrows, he delivered himself up to death, and thus acquired the power of delivering us from death. By offering himself a sacrifice on the cross, he vindicated the honour of those laws which sinners had broken, and rendered the exercise of favour to them consistent with the holiness and wisdom of God’s government; and by his resurrection from the dead, he proved the efficacy and acceptableness of his sacrifice. In a word, Christ not only declared, but obtained the availability of repentance in pardoning and becoming, by his intercession, not only the sinner, but the author of the means of our future immortality:—

in such a sense that we owe them to him, as well as primarily to God.” This author has declined the use of the terms sublimation and satisfaction, because they do not occur in scripture; but others have alleged, that though the literal expressions do not occur, the phrasing of the faced writers warrants the use of them.

Among other writers who have totally rejected the doctrine of atonement according to either of the explanations above given of it, we may mention Dr. Prießley, who reckons it in the class of the corruptions of Christianity. See History of the Corruptions of Christianity, vol. iii. p. 152, &c. In all the books of scripture, says this writer, we no where find the principle, which the doctrine of atonement is founded on, which is a display on the part of God, of justice, and of his abhorrence of sin, so that God could not pardon it without an adequate satisfaction being made to his justice, and the honour of his laws and government. Admitting the popular doctrine of atonement, the whole of the Old Testament, as he conceives, is a most unaccountable book, and the religion it exhibits is defective in the most essential article. The Jews in our Saviour’s time, it is said, had certainly no idea of this doctrine; for if they had, they would have expected a suffering, and not a triumphant Messiah. And it is alleged, that our Lord and his apostles are silent with regard to it. This author undertakes to explain the sense in which Christ is represented as a sacrifice, and other figurative interpretations of it, independently of this doctrine. He proceeds to examine the sentiments of the Apocryphal fathers, and though he allows that single expressions occur in their writings which seem to favour the doctrine of atonement, the general strain shows, as he apprehends, that they had no proper idea of it. It is also argued that this doctrine is not enumerated as an article of Christian faith in any ancient summary of Christian doctrine. To the too literal interpretation of the figurative language of scripture, Dr. Prießley ascribes that advance towards the doctrine of atonement, which was observed in the third and fourth centuries. Grotius shows (Opera, vol. iv. p. 547) that this doctrine is maintained by Théodore Abucara, a Greek writer of the ninth century; but in the Latin church it does not seem to have been fixed in the eleventh century, although there are obvious and indelible references to it in the writings of Anselm, and also in Theophilius, a Greek writer cited by Grotius. Wickliffe evidently believed the absolute necessity of the death of Christ in order to the forgiveness of sin, and after the reformation by Luther, the doctrine of satisfaction, or atonement for sin, was reduced to a regular system grounded on certain principles, and pursu’d to its proper extent. It was unequivocally avowed in the confession of faith presented to Charles V. at Augsburg, in 1530; in the Helvetic confession of the year 1536; and at the synod of Dort, 1618. It is now the doctrine of the established churches of England and Scotland; and it is very generally retained, at least in some qualified sense, by divines and others, both Trinitarian and Aran. Socinus dialected it, and his followers have almost universally exploded it. We observe, that though the word atonement frequently occurs in the Old Testament, we meet with it but once in the New Testament, and in other places the same original word, expiatis, is rendered reconciliation. As for those who reject the generally received doctrine of the atonement, they maintain, that the great object of our Lord’s mission was to teach the doctrine of a resurrection to a future immortal life, and that hence arose the peculiar necessity and utility of his own death and resurrection as a proof of his doctrine. See Expiation, Illustration, Propitiation, Sacrifice, and Satisfaction.

Atonement, Day of. See Purl of Expiation.

ANTONIA, see in Medicine, a term which signifies a want of tone, firmness of strength, in the muscular fibre; in other words, a relaxation thereof; from a privative and voc. tend. id est, or extend. This condition takes place either partially or generally in most forms of chronic diffuse, and in the convulsive period of acute diseases. The remedies are the Peruvian bark, hitters, chalybeats, sulphuric acid, cold bathing, country air, and exercise, with a mild and nourishing diet.

ATONICS, in Grammar, denote words unaccented. See Accent.

ATOOL, or Attowai, in Geography, the most northern and the largest of the west group of the Sandwich islands, being about 300 miles in circumference; containing, according to the statement in the third volume of Captain Cook’s voyage, about 54,000 inhabitants. It has a good road and anchoring place on the south-west side of the island, called Wymon. It is observed in the account of Portlock’s and Dixon’s Voyage to the north-west coast of America, that the east side of the island lies gradually from the sea, till it terminates in high land, near the centre of the island. The height of the most elevated land or mountain, according to Marchand, (ubi infra, p. 15,) is 1216 toises. The hills are clothed to the summit with lofty trees, exhibiting a beautiful verdure. The land next the shore on the east side is uncultivated and desolate of inhabitants; but to the westward it is generally cultivated, and houses are scattered along the shore. The domestic animals on this island are hogs, dogs, and fowls. Its principal vegetable productions are yams, sweet potatoes, the sugar cane, and a sweet root called by the natives, tee. Some trees were found about fifteen feet high, with spreading branches, a smooth bark, and a nut resembling a walnut; others about nine feet high, with blossoms of a beautiful pink colour; and a variety with nuts, like our horse chestnut, which are used by the natives as habiliments for candles, and give an excellent light. The island affords a supply of fresh water. In Marchand’s Voyage (vol. ii. p. 80,) we have an account of two English sailors, who had been carried off from an English brig by the natives of this island, and who confirmed the report of Captain Cook concerning the natives of the Sandwich islands, that these islanders are cannibals, and eat their prisoners. The relation, however, is disputed, and it is suggested, that the natives of these islands cut in pieces the bodies of their dead enemies, burn their flesh, and preserve their bones as trophies for perpetuating the memory of their exploits. Thus, it is said, they dealt with the body of the unfortunate captain Cook. In the voyage of Vancouver, who visited this island in 1792, we are informed, that the prostitution of the women is here carried to the most wanton excess. Vol. i. p. 171. N. lat. 27° E. long. 200° 30’. See Sandwich Islands.

ATOTOTL, in Ornithology, a name under which Seba describes
describes the purple creeper, or *Ceratia purpurea* of Gmel.
axis virginiana phoenicea de Aotot dicta. Seis Muf. t. 72. See *Purpurea Certhia*.

ATOGGLA, in Geography, a small town of Portugal, in the province of Lissamuria, seated on an eminent near the sea, opposite to the rocks called Burghs, defended
by a castle, and containing about 1500 inhabitants; two
miles and an half call of Peniche.

ATUN, a large tribe of Arabs that possessed the
island of Suez, and from thence go up between the Red Sea
and the mountains that bound the east part of the valley
of Egypt. See *Hosmadat*.

ATOPYQUE, a deep and large river of America, in
Mexico.

ATR, in *Canto*, a species of *Patella*, described
by Schurt. The shell is black and flared; vertex pale;
bottom with a spatulate brownish spot, and surronded
with a horzioe-shaped band of white. About an inch and a
quarter in length. The country is unknown.

ATRA, a species of *Helix*, about two inches in length,
and confining of seven whors. The shell is tapering,
black, and minutely flared; whors rather convex: apertu-

ATRA, in *Entomology*, a species of *Conops* (*Mysop* Fabr.)
that inhabits Denmark and Germany. The abdomen is cy-
indrical and incurvated; body black. Gmel. The mouth
of this insect is white; antennae black, with a yellowish
band; legs black; palopter thighs yellow.

ATRA, a species of *Phaena* (*Bembyx*), entirely of a
fery-black colour, and without spots. This is *Bembyx
hieraticus* of Fabricius, and *Tinea graminella* of Wien Schmet-
tter. The larva is black and hairy, with a fagunious
coralline line; it secretes itself within a foldic composed
of dried leaves and twigs. The pupa is ferruginous brown.

ATRA, a species of *Cicada* (*Cercopis* Fabr.) of a large
size, that is found in South America. It is black, with a
marginal fagunious stripe on both sides of the wing-cases.
Fabricius &c.

ATRA, a species of *Ponura*, very common in Europe.
It is glose, brown, and shining; antennae long, and of

ATRA, a species of *Pimelia* (*Helops* Fabr.) of a black
colour, with flied wing-cases. Gmel. Fabr. &c. This is
*Pyroccorus (niger)* nitida corpore ovato, thorace convoco,
antennis pedibusque fusce, of Degeeyer. Inhabits Europe.

ATRA, a species of *Buprestis*, that inhabits Germany,
and in some parts resembles *Buprestis viridis*. The wing-
cases are entire, somewhat linear and punctuated; thora-
كس flexed; body black. Fabricius.

ATRA, a species of *Lampyris* (*Lyca* Fabr.) of a deep
black colour; thorax orbicular, and with the wing-cases red;
a impressed black spot on the back. This is a native of Europe.
Muf. Lebk. Linn.

ATRA, a species of *Cantharis*, the body of which is
entirely of black. Fabricius. A native of the north of
Europe.

ATRA, a species of *Necyposalis*, of a black colour with
all the thighs clubbed. Inhabits the south of Europe.
Fabricius. The thigh in one fex simple.

ATRA, a species of *Leptura*, the body of which is to-
tally black. Fabricius. The legs of this kind are some-
times ferruginous. Podas calls it *Leptura elegia*, and Geof-
froy, *Stenocorus tusque nigre*. Inhabits the south of Europe.

ATRA, a species of *Cerifico*, of an oblong form, and
black colour, with rufous antennae. A native of Europe
and supposted to be a variety of *C. chlorops*. Gmel. Fabr.
&c.

**ATRA**

**ATRA**, a species of *Hippos*, the body of which is
entirely deep black. Sch. der Beilt. &c. Gmel. Fabricius
describes it as having fulvous antennae; thorax and wing-
cases spiny; and body black. Geoffroy calls it *Cerifico*
atri spinis horrida. It inhabits the south of Europe
and the north of Asia, and feeds on the roots of grass.

**ATRA**, a species of *Clytia (Ala* Fabr.), found
in Germany. It is glossy or shining black, with the back of
the antennae, and foles of the feet pitch; black. Gmel.
Geoffroy, &c.

**ATRA**, a species of *Coccinella*, of a black colour,
with two yellow spots; margin of the thorax and tail
yellow. Thunberg. The body of this insect is very gillous
and glabrous.

**ATRA**, in *Ornithology*, a species of *Musicia*, called
in the Arctic Zoology the *Dryfly Fly-catcher*. It is of an oliv-
ean colour; breast cinereous; belly pale reddish-yellow;
head, tail, and quill feathers black; margin of the secondary
and exterior webs of the exterior tail feathers white.
Gmelin &c. This is a native of New York, where it ap-
pears in March, and departs in August; feeds on bees.
and lays five small white eggs; legs black.

**ATRA**, a species of *Tanagra* that inhabits Guiana.
The bird is cinereous; face, chin, and throat black in the
male, and brown in the female. Buffon calls it *Canal* or
Cravatte, and *Tanara a cravatte noire de Cayenne*. The
length of this bird is seven inches; the bill and legs black;
base of the upper mandible white.

**ATRA**, a species of *Tringa*, that inhabits the banks of
the Rhine. The head and neck are black; back and wings
brownish intermixed with black; breast and belly cinereous;
rump cinereous, undulated with black and white. Sander.

**ATRA**, a species of *Aedea*, entirely of a black colour,
with a smooth head and face, bare of feathers. Gmel. The
wings are glossed with blue. Bruft. calls it aedea nigre;
Buff. héron noir; and Latham the black heron. It inhab-
bits Silezia.

**ATRA**, in *Ancient Geography*, the capital of the
Carabins of Singaren; who formed a tribe, which possessed
an independent territory of Meopotamia. Trajan besieged this
place in the year 117, but by the resistance of the inha-
bants, and the heat of the season, he was obliged to aban-
don the enterprise. The town was seated on the top of a
high mountain in a dry and desert country, and encmp-
pilled by a strong wall. It retained its reputation under
Sutarius, but was ruined under the reign of the emperors
Jupiter.

**ATRABILARIE Capsula, in Anatomy. See Cap-
Sule.**

**ATRABILIS, Black Bile, in Medicine.** The ancients
(fays Dr. Percival), as appears from Galen, supposed the
bile to be derived either from the dregs of the blood, or
from yellow bile torrefied and highly concocted. A cele-
brated modern anatomist is of opinion that it is blood, which,
having lodged some time in the intestinal canal, has acquired
a blackness and putridity. But is it not (this elegant and
ingenious writer affirms) more probable, that in general it is
no other than gall become acid by stagnation in the vepra
felves, and rendered vifcid by the absorption of its solid
parts? When discharged into the duodenum in this state,
it occasions universal disturbance and disorder till evacuated
by either vomiting or purging. A young gentleman who
laboured under a marasmus produced by intemperance,
and which at first proved fatal, voided several times both
by stool and vomiting a considerable quantity of black,
tenacious, and most offensive bile. The symptoms which
preceded the discharge, and which ceased soon afterwards,
were a quick pulse, head-ach, delirium, hiccup, insatiable thirst, inward heat, and an uncommon fever in his breath. A lady aged thirty, unhappily addicted to habits which have a peculiarly pernicious effect upon the liver, after a contusion of the belly during six days, was seized with a violent and incessant vomiting of black and viscous bile. The influenza fever himostatin, warmed with the texture of Columbo, soon checked her retching, and operating by fluid, prevented the return of her vomiting. The matter discharged in both these cases bore not the least resemblance to purulent blood. Dr. Percival adds, that he has fever. I times observed the febrile symptoms in children, which are ascribed to denutrition, relieved by these pit-by-pit floods; and that he recollects three cases of the disease called acute afflux by Dr. Millar, in which the paroxysms seemed to be critically terminated by a similar evacuation. Whether, in these instances, the black bile was the cause or the effect of the disease, cannot (he observes) with certainty be determined; but the former appears to him to be the more probable opinion. Percival's Essays, Medical, Philosophical, and Experimental, vol. i. p. 344. 4th edit. This view of the subject is very satisfactory: but as an evacuant, peculiarly adapted to this disorder, we would suggest the employment of colome. Black bile was supplied by the ancients to constitute a peculiar temperament, which they termed the strabiliary or melancholic temperament. See Temperiments.

The disease termed Melona, or morbus riger, in which there is a dark-coloured bloody discharge, unaccompanied by griping pains and acute fever, seems to be a species of diarrhoea. (See Melona.) Before we close this article, we would observe, that black or pitchy floods may be occasioned either by discoloured bile, or by the effusion of venous blood into the intestinal can. An experienced practioner will seldom be at a loss to distinguish the difference; but if any doubt arise, recourse must be had to chemical analysis.

ATRACES, in Ancient Geography, a people of Europe, in that part of Greece called Etolia. Their country was watered by the river Atras, whence their name.

Species. 1. A. gummifera, gummy rooted stractylis. "Flowers flexible." From the root which is perennial, five many narrow deeply flufinated leaves, armed with spines on their edges. These lie close to the ground, and between them the flower is situated; it is white at the border, but yellow at the disk. A native of Italy. The root abounds with a gummy matter, which occasioned it to be chewed for the same purposes as mallow. 2. A. humilis, dwarf stractylis, Cavam. Hflp. 40. 1. 54. B. Bartr. rar. 1127.

1. 592. "Leaves tooth-fluted; flower radiated, fringed with an expanding involucre; stem herbaceous." Stems nearly a foot high; leaves indented, spinous at the edges; flowers purple, in heads on the branches; root biennial. A native of France and Spain, blooming in June. Cavannile's description of this plant differs from the above.

3. A. canalaeta, netted atractylis. "Involucres latticed, bellying, linear, toothed; calyxes ovate; flowers feathery." Annual, eight or nine inches high, producing two or three slender branches, each terminated by a head of flowers like those of the thistle, with an involucre composed of several narrow leaves, armed with spines on their sides, and curiously netted over, which keeps off the flies; florets purple. A native of the south of Europe. It was cultivated here in the time of Parkinson.

4. A. lancor; lance-leaved atractylis. "Involucres pineapple, leaves lanceolate, ciliate, smooth." Stem a foot high, flexuose, branching; leaves alternate, acute, fimbrie, erect; flowers on the branches terminal, solitary, subfide. It differs from the third in having smooth leaves, and a leafy stem.

5. A. ovata; ovate-leaved atractylis. "Involucres pineapple, leaves ovate, ciliate, smooth." Stem simple, flexuose, erectly a foot high; leaves alternate, petioled, acute, narrowed, pale underneath; petals with ciliate edges; flowers terminating, solitary. Both these have not natives of Japan.

6. A. opposita. opposit-leaved atractylis. "Leaves opposite." Leaves and calyxes tomentose underneath. Receptacle with hair-like chafts. In the ligulate flowers the authors are effete, and there is neither flower nor stigma. A native of the case of Good Hope. 7. A. purpurata; purple-flowered stractylis. Smith. i.c. med. 6. 15. "Leaves lanceolate, runcinate." Stem round, woolly; leaves crowded, a span in length, acute, irregularly toothed, veined, tomentose underneath; peduncles longer than the leaves, branched, angular, rugose, wooly, covered at top with linear acute leales; flowers large, erect, fimbrie, purple; receptacle naked. Found by Mutis in New Grenada. 8. A. Mexicana; Mexican atractylis. Smith. Icon. med. 66. "Leaves oblong, quite entire." Stem shrubby; branches simple, leafy, without sipes, covered with a downy subflanne; leaves alternate, lanceolate, acute, minutely veined, with dotted veins; beneath very white, tomentose; petals keeled, tomentose, flower terminating, nodding, purple, supported by two or three bracteate-leaved leaves; receptacle with very short chaffs. Found by Mutis in Mexico.

Propagation and Culture. "1, 2, 3, are propagated by seeds, which must be obtained from the countries in which they grow naturally: these should be sown on a border of light earth, in a warm situation, early in April, and when the plants come up, and are fit for transplanting, they should be thinned, and those which are drawn out may be transplanted, leaving the others two feet astride; after which, the only culture they require is, to keep them clear from weeds in summer, and in winter to cover the roots with some old tanner's bark to prevent the frost from penetrating the ground. The other species are yet strangers to European gardens; and whenever they are introduced, will require the proteciton of a green-house or frame." See Martyn's Miller's Diet.

ATRACYLIS. See CARTHAMUS.

ATRA Diet, in Antiquity, denotes a fatal day, whereon the Romans received some memorable defect. "The word literally imports a black day; a denomination taken from the colour, which is the emblem of death, and mourning. Whence the Thracians had a custom of marking all their happy days with white stones, or calculi, and their unhappy days with black ones, which they call, at the close of each day,
day, into an arm. At the person's death, the flowers were taken out, and from a comparison of the numbers of each complexion, a judgment was made of the fertility or infecility of his course of life.

The eae atre, or etre, were afterwards denominated etre, and end. Such, in particular, was the day when the tributes were defeated by the Gauls, at the river Allin, and fled the city; also that on which the battle of Caesar was fought; and several others marked in the Roman calendar, as atre, or omtre.

Species, 1. A. japonica. japonica argentea, Erect, leaves opposite, ternate; leaflets ovate, gauzy. Stem angular, broken, pubescent, villosa, two feet high; leaflets acute, toothed, very thinly villosa; petiole stem-leafing; flowers from the divisions of the stem, few, on elongated one-flowered filiform peduncles; petals more than twenty, purple within, white-tomentose without. Were it not for the number of its petals it would belong to theameron. A native of Japan. 2. A. alpina. Alpine atragene, Jacq. All. 3. 12. 164. Clematis Sibirea, Mill. fig. 1. 284. "Leaves doubly terebrate, ferrata, outer petals four-fold." Stems slender, weak, covered with brown thin bark; leaflets two inches long, of a deep green colour; peduncles naked, three or four inches long; one flowered; calyx yellowish white within. This plant is different from the described several botanists, and Jucquin affirms that the Aurivillia plant is specifically different from the Alpine. A native of the High Alps of Switzerland, &c. 3. A. capensis, Cape atragene. "Leaves terebrate; leaflets gauzy, toothed, outer petals five-fold." Scape simple, fix or seven inches long; involucre in the middle of the scape, composed of swelling, ovate, villose, foliaceous lippes; flowers wedge-shaped, tridid, acute, naked; petals about twenty, white, the fix lower ones broader, villose under, purpureus. A native of the cape of Good Hope. 4. A. tenacifolia, fire-leaved atragene. "Leaves doubly sinuate; pinnae linear, entire." Found at the Cape by Thunberg. 5. A. ceolonea, Ceylonese atragene. "Tendris two-leaved." Caulescent, scandent; leaves opposite, compounded, conjugate, leaflets ovate, entire, or sometimes with a single tooth, three-nerved, on very short footstalks; panicle terminal, composed of a twice trifid peduncle, bearing commonly nine flowers; petals twice the length of the calyx, purpureus. A native of Ceylon.

Propagation and Culture. The second species may be increased by cuttings or layers in the same manner as Clematis. In a strong soil, and trained against a wall, it will rise to the height of six or eight feet. The flowers appear early, and if the flower prove favourable, they make a handsome appearance; but as this plant is apt to put out leaves very early in the spring, it is frequently nipped by the frosts. The other species have not yet been cultivated in England. See Martyn's Miller's Dict.

ATRALIS, in Entomology, a species of Philaena (Genus), of a black color, with two white spots on each wing. Fabr. Doct. Ent. Inf. &c. This is a native of Europe; it is called Philaena baccaria by Mill. Zool. Philaena funebris, Act. nob. and philena guttata, Wett. Schmidt. &c.

A. SAMINENTIA. See Insects.

ATRAMPLEMENTATA, in Entomology, a species of Philaena (Genus) that inhabits Europe. The wings are white, sprinkled with black dots.

ATRAMITE, in Ancient Geography, a name given to the inhabitants of Hadramaut, or Hadramuth, a rich and flourishing country of Arabia Felix. See Hadramaut.

ATRAN, in Geography, a town of Naples, in the Principality Citer, limits between two cliffs, joined together by buildings. Along the valley a road winds up to Rivello and Scala, two episcopal cities, or rather struggling villages, on the mountain tops. It is not far from the city of Amalfi.

ATRAPHAXIS, in Entomology, a species of Cynthocephalus, about the size of C. quadricinctus. It is black, with their red spots; wing-cells tetrathecal, with three black spots; thanks nodes. Fabr. This is ebrincola atraphaxis of Pallas, and inhabits Siberia.

Species, 1. A. spina, prickly-branched atraphaxis. L'Herit. Stirp. Nov. 27. t. 4. "Branches spiny." It rises four or five feet high, leading out many weak lateral branches, armed with spines, and furnished with small spear-shaped smooth leaves, of an ahi-colour. Flowers at the ends of the shoots in clusters, each consisting of two white petals tinged with purple, included in a two-leaved calyx, of a white herbaceous colour. L'Heritier has described this plant very particularly, viid. l. c. It is a native of Armenia, Siberia, and Perlia, flowering in August. Cultivated by Miller in 1759. 2. A. undulata, waved-leaved atraphaxis. Dill. Ethr. 36. t. 32. e. 36. (called argenfeula africana, &c.) "Without Ispines." Stems about a foot long; leaves ovate, obtuse, waved at the edges, alternate, longer than the internodes. Flowers in oblong spikes, at the ends of the stem and branches, furnished with short bractes. Calyx yellow, involucr of the fruit. The flowers are commonly quadrifid, but sometimes they are fix-parted, with eight stamens. Several authors make this to be a species of polygonum, while others would unite the two genera.

Propagation and Culture. "The seeds of these plants not ripening in England, they are propagated by cuttings during any of the summer months. In winter they must be sheltered from hard frosts, which commonly destroy such as are planted in the open air." See Martyn's Miller's Dict.

ATRARIA, in Ichthyology, a species of Perca that inhabits Carolina, and is called by Garden, the black fish. The body is black, and the fins spotted with whiteness. Gmelin. The anterior gall-cover is denticulated, poisse.
A T R

A T R A T A, in Conchology, a species of Patella. This shell is rather convex, narrow, white, lined with red; outer lip spotted with black; umbilicus white; aperture at the vertex oblong, bordered with chaffy, sculptured. This shell is about three-quarters of an inch in length, with a created margin, and the vertical aperture surrounded with a reddish ring within.

A T R A T A, a species of NERITA, found in the Atlantic, American, and South seas. Shell deep, black, glabrous, very thinly fluted above; both lips white; exterior one very fluted, and somewhat toothed within; inner one convex, rugose, and tuberculated. Chemo-

A T R A T A, in Entomology, a species of SCOLA that inhabits America. It is hairy and black; wings ferrous, and black at the tip. Fabricius.

A T R A T A, a species of TIFULA. The wings are glau-

A T R A T A, a species of FORMICA, with four spines on the thorax; head depressed and margined, with two spines on each side. This is FORMICA quadrundis of Dagem, and Euph. of Marcgrave. It inhabits Italy. It is black, and without spots: wings hyaline, with a black marginal spot. Fabr. Gmel.

A T R A T A, a species of MUTILLA, which is found in Africa. It is black; thorax rufous above; abdomen black, with two white bands. Fabricius. This is mutilla atrata, abdomen fab-

A T R A T A, a species of TENTHRED, of a black colour; back with a yellow-green band, and three curves of the same colour. Inhabits England. Forster’s Nov. Ins.

A T R A T A, a species of PHYRYNAX, which inhabits Siberia. It is black; wings whitish, with many spots and two bands of black. Lepceba.

A T R A T A, a species of PHALANA (Gometra). The first wings whitish, and black at the base, with a broad black stripe; second pair brownish, with two white undu-

A T R A T A, a species of CICADA, found in China, and de-

A T R A T A, a species of TURBO, of a blackish colour, with double alternate black and cinereous mili-

A T R A T A, in Conchology, a species of MUREX, of a deep black; whorls transversely fluted with tubercles; pillar with a single plait; tail straight. Born. whorls of the spire ten in number; lip circumscribed.

A T R A T A, in Entomology, a species of TENEBRIO (Scal-

A T R A T A, a species of CURCUS, found at the cape of Good Hope. It is glabrous, shining-black; wing-cases flared.
Atratus, a species of Cryptoccephalus. (Cercoceps Fabr.). It inhabits the Order of Coleoptera, and is pale with wing cases entirely bordered with deep black. Gmel. &c.

Atratus, a species of Carabus (Florus Fabr.) which inhabits Ceylan. The thorax is bicoloured; each side; body black; antennae moderate; with ferrate spines in front. Gmel. &c.

Atratus, an European species of Carabus, of a black colour, with black abdominal thorax; pale wing-cases, varied with black; antennae and legs ferruginous-black. Mut. L. &c.

Atratus, a species of Hemorobius found in Africa. The wings are white; the body black. This is a large insect, and inhabits Africa; the thorax is hairy, and the abdomen cylindrical. Fabricius.

Atratus, a species of Lactabus. It is black, and abdomen ferrugineous, with the four front segments black; legs ferruginous; antennae ferruginous, annulated with brown, and tipped with black. A native of Europe. Mut. L. &c. Linn.

Atratus, a species of Cnemus, of an obovate form (Ollongue Sect.) and entirely of a deep black. Geoffroy.

Atratus, a species of Hemorobius found in Africa. The wings are white; the body black. This is a large insect, and inhabits Africa; the thorax is hairy, and the abdomen cylindrical. Fabricius.

Atratus, a species of Lactabus. It is black, and abdomen ferrugineous, with the four front segments black; legs ferruginous; antennae ferruginous, annulated with brown, and tipped with black. A native of Europe. Mut. L. &c. Linn.

Atratus, a species of Cnemus, of an obovate form (Ollongue Sect.) and entirely of a deep black. Geoffroy.

Atratus, a species of Hemorobius found in Africa. The wings are white; the body black. This is a large insect, and inhabits Africa; the thorax is hairy, and the abdomen cylindrical. Fabricius.

Atratus, a species of Lactabus. It is black, and abdomen ferrugineous, with the four front segments black; legs ferruginous; antennae ferruginous, annulated with brown, and tipped with black. A native of Europe. Mut. L. &c. Linn.

Atratus, a species of Echinus that inhabits India. It is hemispherical-oval, and rather depressed, with very short, obtuse, truncated spines; the marginal ones clubbed and depressed. Gmelin. This is tidors violacea aus Klein, and violetta eel-mander of Pelt. Zool. s. p. 30. The form of this kind is rather orbicular, conic, inclining to violet; spaces ten, very finely granulated, with a row of larger tubercles, in the larger ones disposed in a quincunx order, and a double row in the smaller ones; avenues brown, excavated, granulated, with four rows of pores; spines violet, some of them clubbed, some angulated at the tip, and some cylindrical.

Atrebati, or Atrebati, in Ancient Geography, a people of Britain, situated next to the Britons, in part of Berkshire and part of Oxfordshire. According to Camden they inhabited Berkshire; but Baxter says that their country was Oxfordshire. They occupied, as it is said, nearly the whole of the western parts of Berkshire, from the river Loddon on the south-east, the banks of the Thames on the north-west and west, and the hills of East Ilsley, Lamborn, and Albury on the south. The Atrebati were one of those Belgic colonies which had come out of Gaul into Britain, and there retained their ancient name; for they were a tribe of the Belgae, who inhabited the country which is now called Artois. They are mentioned by Caesar among the nations which composed the Belgic confederacy against him; and the quota of troops which they engaged to furnish on that occasion was 15,000. Commius of Arras was a king or chieftain among the Atrebati in Gaul in Caesar's time; Vol. III.

and he seems to have possessed some authority, or at least some influence, over our Atrebati in Britain; for he was reputed by Caesar to persuade them to submission. Hence it is probable that this colony of the Atrebati had not been settled in Britain very long before that time. There were perhaps three of these British tribes which submitted to Caesar; nor do we hear of any remark of the influence which they made against the Romans at their next invasion under Claudius. It is probable, that before this second invasion they had been subdued by some of the neighbouring tribes, perhaps by the powerful nation of the Catuvellauni, which will account for their being so little mentioned in history. Callius Atrebatum, mentioned in Antonine's Itinerary, and called by Ptolemy, Callias, seems to have been the capital of the Atrebati; though our antiquaries differ in their sentiments concerning the situation of this ancient city; some, with Horsey, placing it at Sidleshee in Hampshire, near the confines of Berkshire; Stukeley, at Farnham; and most others, with Camden and Baxter, placing it at Wallingford in Berkshire. It has been doubted, whether the country of the Britons and Atrebati was within the Roman province of Britain Prima, or in that called Flavia Caelestia; but it seems most probable that it was in the laity of these provinces. See Henry's Hist. vol. i. p. 248. vol. ii. p. 413. See Ancilies.

Atrella, in Entomology, a species of Phalana (Time) that inhabits Italy. The wings and body are black and browned; apex of the posterior ones, and the tail telfeaces.

Atresia, from α and τρεις, whence τρεις, to perforate; in Surgery, imperforation, or the state of those persons who want some natural aperture.

Atreati, those persons of either sex, in whom the ovum, or genitals, are imperforate, or close, whether naturally, or occasioned by some accident or disease, as the growth of some bony excrecence, or a membrane which blocks the orifice.

Atri, in Geography, a town of Italy, in the kingdom of Naples and province of Abruzzo Ultra; nine miles east of Teramo. See Atria.

Atri, a village of Egypt, on the right bank of the Damietta branch of the Nile. A little below it runs a large canal, which empties itself into the lake Meroe, towards the easterly part of it. The cottages that compose this village, cover the ruins of the ancient Atriha, which, according to Ammianus Marcellinus, was one of the most considerable towns in Egypt. But no remains of its former extent and grandeur now exist.

Atribunie, a river that runs through the west part of the island of St. Domingo, and empties itself into the sea.

Atricipilla, in Ornithology, a species of Emberiza, of a reddish brown above, beneath cinereous; chin white; crown yellow; fore-head, and stripe through the eyes black. This is emberiza atricipilla of Gmelin, and black crowned bunting of Latham. It inhabits the Sandwich Isles. There is a variety of this bird in which the breast is waved with black; and also another bird corresponding with the first in some respects, but in which the crown is not yellow; this is supposed to be the female.

The black-crowned bunting is seven inches in length; upper part of the plumage reddish brown, and each feather marked longitudinally with a dusky colour; coverts and quills edged with a paler colour; the throat, breast, and belly are ash-colour; the tail marked along the middle with yellowish buff; tail brown; legs brown; claws dusky. Lath.
ATRICAPILLUS, a species of Muscicapa, called by English naturalists the cold-finch and pied fly-catcher. The colour is black; beneath, foot on the front, and another on the wings, white; outer two of the exterior tail-feather white. Kramer, Gmelin, &c. This is motacilla remigibus extimo dimidiatum, ut est albo, of Linnaeus, or an inhabitant of France, erected by Gmelin under the name of Atricapillus, sedulius varia of Aldrovandus, and first variety of Gmelin.

Another, a bird somewhat larger, having the upper parts almost black, with a white throat, and sides almost grey; this is currua alba et nigra, nigra alba of Gmelin, the second variety of that author, and venia columbae of Buffon.

And the third variety is familiarly called by Buffon, and currua folius grises, gula supercilifique atilis of Gmelin; the under parts of this is greyish; the throat and fleck above the eye white; the hind part of the neck deep ash-colour; sides and back pale brown, tinged with green; wings and tail blackish.

ATRICAPILLUS, in Entomology, a species of Turdus, of a brown colour, with a black head; belly and rump rufous; and a black spot on the wing. Gmelin. This is merle à tête noire du capel Bon Esparsance of Buffon. It inhabits the Cape of Good Hope; and is about nine inches in length; the belly is fringed with brown; tail cuneate, the feathers pale at the tips.

ATRICAPILLUS, a species of Caranus, of the winged kind. The thorax is rufous; wing-caules tateaceous and obtuse; head black. Fabricius. Ost. Gmelin describes it as being yellow, with a black head and very obtuse wing-caules.

ATRICAPILLUS, a species of Staphylinus that is found in England. The thorax is rufous; wing-caules fuscous, with a dot at the base and posterior margin white. Fabricius.

ATRICAPILLUS, in Ornithology, a species of Linius that inhabits Surinam, and is called by some the Surinam shrike. The tail is wedge-shaped, and with the crown, neck, shoulders, and wings black; body above moule-colour; beneath of a bluish ash-colour. Merram. Beytr. &c. The length of this bird is five inches; wings short; margins of the wing-coverts and secondary quill-feathers white; all the tail-feathers, except the two middle ones, tipped with white.

ATRICAPILLUS, a species of Psittacus called by Buffon arcu Moluccas varia. It is a native of the Molucca isles, and about fourteen inches in length; colour above blue; chin, throat, and breast red; belly and vent grey; crown black; neck green and red. Gmelin. The wings and upper tail-coverts are blue, lower green, varied with red; tail green above, beneath red, edged with black. Klein calls this psittacus capite nigro, collari viridis, and Buffon grande perucca à bandeau noir.

ATRICAPILLUS, a species of Charadrius, called by Latham the black-crowned plover. Above it is cinereous brown, beneath white; bill and legs red; crown black; en-circled with white; neck and breast cinereous, and terminating in a transverse dusky streak. Inhabit New York, Gmelin. The front is black; bill black at the apex; base of the tail white, blackish near the extremity, tips white.

ATRICAPILLUS, a species of Parus, found in North America, and called the Canada timmouf by Pennant and Latham. The cap and throat are black; body cinereous, and white beneath. Buffon calls this parus atricapillus canadensis, and Buffon mifange à tête noire de Canada. The length of this bird is four inches and a half; it feeds on worms and insects, and bears cold with remarkable perseverance. The upper tail-coverts are whitish; greater wing-coverts brown, edged with grey; quill-feathers brown, with the exterior edges grey, and the inner ones whitish; middle tail-feathers cinereous; lateral ones brown, with grey margin; legs and claws blackish. Gmelin, &c.

ATRICS, or ATRICES, in Surgery, small tubercles about
AETR

Species. 1. A. halimus, tall, shrubby oracle, or Spanish fen-purpure. "Stem shrubby; leaves deciduous, entire. Root perennial, woody, branched. The whole shrub is white; stems from four to fix inches high or more, dividing into woody brittle branches; leaves scattered on long footstalks; flowers small, purplish, at the ends of the branches. It grows in hedges near the sea about Nice, also in Spain, Portugal, Sicily, &c. According to Pauwilion it was cultivated here in 1640. 2. A. purpureascen, dwarf shrubby oracle, or common fen-purpure. Hudf. With. Lightf. Eng. Bot. 4. t. 261. "Stem shrubby; leaves deciduous. A low underbrush; leaves narrow, whitish; branches angular, reching, glaucous; flowers in clustered spikes terminal, yellow. It grows near the sea in salt marshes, flowering in July and August. 3. A. glabra: "Stem underbrushy procumbent; leaves ovate, filiform, quite entire; the lower ones subdeterminate. Stem three or four feet long, with deciherous branches; leaves thickish, of a silvery glaucous colour; flowers yellow at the axils of the upper branches. A native of France and Spain. 4. A. rufus. Villars Dauph. 2. 553. "Stem herbaceous; leaves hoary, serrate, fruit quadrangular, toothed. Stem erect, somewhat angular, white, smooth, branched, a foot and a half high; leaves alternate, suboblong, rhombic-shaped, minutely-toothed, covered with a farrinaceous white powder; flowers in close cletes, axillary; valves of the fruit hoary and finely notched. A native of the south of Europe. Annual. 5. A. Iberica, Iberian oracle. "Stem herbaceous; leaves deltoid angular, calyces of the fruit muciated on the outside. This is of the same size as the A. hortensis. The fruit is tomento- tose at the base, and muciate on the outside; the leaves are silvery beneath, and the flowers white. A native of Siberia. Annual. 6. A. tartarica, Tartarian oracle. Hudf. 443. n. 2. 3. "Stem herbaceous; leaves deltoid, minute-toothed, waved, alternate. According to Linnaeus, this is five or six feet high. Mr. Hudson considers it as a variety of the laciniata produced by cultivation. 7. A. hortensis, garden oracle. Gmel. Sib. 3. 71. Gertm. Fruth. 1. 362. "Stem erect, herbaceous; leaves trigonom. Root annual; stem above three feet high. Leaves thick, pale, and variable in their shape; values of the calyx ovate-cordate, brakced, entire. A native of Tartary, and cultivated by Gerard in 1556. It was formerly cultivated as a culinary herb, being used as fpiage, and it is still eaten by the French. There are some varieties of it which depend wholly upon colour. 8. A. laciniata, pitted fa oracle, Hudf. With. Lightf. Eng. Bot. 3. 162. "Stem herbaceous; leaves lacinate...
Propagation and Culture. 1, 2, 3. may be increased by cutting the plucked in August, and of the summer months, on a fairly border; where, if they be daily watered, they will be in a state to transplant the Michaelmas following. No. 7, must be fown for use in the spring, or at Michaelmas, soon after the seeds are ripe, which is better. These plants require no other care, but to lose them when they are about an inch high; to cut them down where they are too thick, leaving them about four inches alread, and to clear them from weeds. When the plants are about four inches high, it will be proper to hoe them a second time, and if this be well performed in dry weather, the ground will remain clean until the plant is fit for use. Where it is fown on a rich soil, and the plants are allowed a proper distance, the leaves will be very large and in that the excellence of the herb coeds. U. & 3. it be eaten when young, the falks become tough and good for nothing. The feed will ripen in August, when the plants be cut or pulled up and laid on a cloth to dry; after which the feed be beaten out and put in bags to dry. Most of the other feeds, so far from being cultivated in gardens, are to be rooted out from them as rank weeds. Martin's Miller's Diet.

APRILIS. See ATRAPHAXIS, AYXYS, BLITUM, CHENOPODIUM, and GALENIA.

APRILICIS, in Ent molony, a species of SCARABAEUS (Melolontha.) This insect is oblong, violet, pale; future and apex of the wing-cages black; shield of the head reflected. A native of Barbary, and feds on the apricix hafmifolia; in fixture and appearance resembles S. rufcoris.

APRILICIS, a species of CURCULIO that is found upon the shores of Norway. It is long and black; thorax shining, wing-cages tinted d and obtuse. Genie.

APRILICIS, a species of PHALEN (Nozaa.) The first wings are clouded with brown, with a yellow bull's eye in the middle, Fr. Ste. Fabr. &c. The head is naked, reddish, dotted with white, and marked along the back with a brown line. Pupa, naked and brown.

APRILICIS, a species of AMIS that infests the apricix hortensis. The body is glossy black, plaited at the fides; hack's pale; tail obtuse. Fabr. &c.

ATRIROSTRIS, a species of CURCULIO. It is canecous, with the foit arched and black. Inhabits Leipzig. Paskull.

ATRIUM, in Ancient Architecture, one of the interior divisions of the ancient Roman houses. Julius Cæsar tells us, that even in his time many learned perfons confounded together the terms atrium and vestibulum. Cicero tells us, that the vestibulum was not a part of the interior of the house, but only a large corum at the principal entrance, perhaps analogous to the modern loggias of the Italians. Cicero, in a letter to Atticus, seems to express the fame thing, when he fays, that in passing through the fcreened doors, when he was near it, that by this means, he took the face to the vestibulum of Tatosus. "Secchi in vestibulum Cati Domini." From the time of Aulus Gallus, the fame uncertainty of the exact meaning of these words continued, and they became almost synonymous. It muft be flill more difficult at the prezent time, to aflign to the atrium its true fiation and use.

Martial places the colossus of Nero in the atrium, and Sienusinus in the vestibulum; from whence it refults that one of them must have employed one of these terms improperly. Vitravius even at one time employs the word atrium for curulum. Virgil in this veft, "apparet domus vitruus et atria longa patetulant," gives us to understand, that the atrium was an inferior part of buildings; and it appears certain,
certain, that this was a particular place in private houses, palaces, and temples.

From the description which Vitruvius gives us of it, it appears to have been an oblong room, having its breadth divided into three parts by two rows of columns. He gives rules for placing these columns according to the general proportion of the atrium.

The atrium was flanked after the cewadum which was what we commonly call the court, and immediately before the tablinum. It was in the atrium that the Romans placed the statues of their ancestors, and it was also sometimes used as an eating room, though they had also other places defined for the purposes of the table. This is proved by Virgil, who in describing the place where they made their repast, says,

"Cratera magnas flabebunt et visa coronat,
Putripitis teetis vocenque per amuba volatant.
Atria dependent lycini laquearius aurea."

It follows from this, that we must consider the atrium as one of the interior parts of the house, in which it differed from the cella, and that it was covered, which distinguishes it still more from the cewadum or the empluvium.

Some temples had also an atrium: of this number was the temple of Vesta, and that of Liberty. It was in the latter (viva Titus Livius) that they deposited the hoffages of the Tarponites. It appears that it was a covered semi-circular court, if we may judge from the ancient marble plan of Rome, which is preferred in the capital, on which we still read these words "atrium libertinum." 

If we may believe the historians, the use and form of the atrium were borrowed from the Etruscans, and this appellation come from the city of Atria, or Adria, which gives name to the Atrians or Adriaticus fac, and where this sort of porticoes was much used.

Feustas says "atrium proprii est genus edificii dictum atrium, quia id genus edificii primi atri in Etruria sit in flaskum." Varro de ling. Lat. 1. 4. "atrium appellation ab atriciis Tufciis illiac enim exemplum fumtun." 

Atrium, in Ecclesiastical Antiquity, denotes an open place or court, before a church, making part of what was called the narthex, or ante-temple.

The semiovate, the ancient churches, was a large area, or square plat of ground, surrounded with a portico or cloyster, situated between the porch or vestibule of the church, and the body of the church.

Some have mistaken confounded the atrium with the porch or vestibule, from which it was distinct; others with the narthex, of which it was only a part.

The atrium was the mansion of those were not suffered to enter farther to the church. More particularly, it was the place where the first class of penitents flooded, to beg the prayers of the faithful, as they went into the church.

Atrium is also used, in the Canon Law, for the cemetery, or churchyard.

In this sense we find a law, prohibiting buildings to be raised in atrio ecclesiae, except for the clergy; which the glossary explains thus: id exit in eminentia, which includes the space of forty paces round a large church, or thirty round a little church or chapel.

ATROPA, in Botany, (from Atropos, the third fate, who was supposed to cut the thread of life) deadly nightshade. Lin. g. 249. Schreb. 335. Juff. 125. Gaertn. t. 131. Chis, pennatiria monoginoa. Nat. Ord. Lurida. Solanine. Juss. Gen. Char. Cal. perianth one-leaved, five-parted, gibbous; divisions acute, permanent. Cor. one-petalled, bell-shaped; tube very short; border ventricose ovate, longer than the calyx; mouth small, five-crested, spreading; divisions subequal. Stem filaments five, subulate from the base of the corolla, and of the same length with it, converging at the base, above diverging outwards, bowed; anthers thickish, ribbed. Pyll. gemmiformes; style filiform, the length of the flowers, expanded. Stigma laeved, linearly obovate, oblong. Flo. berry globular, fitting on a large calyx, two-joined. Receptacle basal, convex on both sides. Seeds, very many, reniform.

Species. 1. A. Mandragora, mandrake, Woody. Med. Bot. t. 227. "Stembeles, fcapae on-fovered." Root perennial, large, tapering, three or four feet long, externally brown, internally white. From the crown of the root arises a circle of leaves, which are large, ovate, truncate, veined; they fit close to the root, and are of a deep green colour, andedin small; among these are three or four short slender fdeas, each supporting a single flower of an herbaceous white colour; fruit a globular boot berry of a yellowish colour, and about the size of a nutmeg. A native of the south of Europe. It was cultivated here, according to Turner, in 1562. The superstitious and absurd stories related of the mandrake would not now for a moment impress on the more credulous and ignorant. The supposed resemblance of some of the roots to the human form, the danger of taking them out of the ground, as well as their surprising effects, seem to have been the invention of charlatanical knavery and imposture. Boerhaave used the leaves as a cataplasm with success in cases of indurated tumours, and Hoffberg experienced the like effects from the roots in glandular swellings; the latter also found that three grains of the root given internally had a considerable narcotic effect in mitigating arthritic pains. See Woody. t. c. 2. A. belladonna, deadly nightshade, Hud. 93. With 292. Smith Brit. 255. Curt. Lond. 3. 1. 16. Woody. Med. Bot. t. 1. Eng. Bot. 532. "Stem herbaceous; leaves ovate, entire." Root perennial, thick, fath, creeping; stalks herbaceous, annual, erect, firm, three feet high, round, branched, leafy, subpubecent; leaves leaflike, two together, of an unequal size, petiolar, ovate, acute, entire, smooth, and of a dull green colour; peduncles lateral, staminal, orileas, one-flowered, nodding; flowers of a dirty violet colour; calyx rather pubeascent, villous, anthers large, white; berry depressed, furrowed; when ripe of a flaming black colour, and abounding with a purple juice. It grows in waste-ground and gloomy lanes, &c. This plant has been long known as a very strong poison of the narcotic kind; the berries, which are said to be lefs powerfully so than the leaves, have produced many instances of their fatal effects, particularly upon children, who are readily tempted to eat this fruit by its alluring appearance and sweet taste. Whether these berries eaten in different states of maturity renders them more or less deleterious, has not been ascertained; but we are told that in some iatuses, one berry, or even half of one, has produced a fatal effect; while Haller informs us, that he has seen a fellow-student of his eat more than three or four without suffering any inconvenience from them. The symptoms produced by this poison are vertigo, delirium, great thirst, painful deglutition, and retching, followed by fever, frider delirium, and convulsions; the eye-lids are drawn down, the usual dilated and immovable, the face becomes red and tumid, and phaenomena affect the mouth and jaw; the palsy and irritability of the body suffer such great diminution, that large and repeated doses of the strong extract of the berries produce no sensible effect;"
effect; the pulse is small, hard, quick; and fulness tending
vitalium, rhus sardanum, and coma, close the fatal scene.
Vinegar liberally drank has been found most efficacious in
obviating the effects of this poison. Upon opening the bodies
of those poisoned by this plant, inflammation and edematous
of the stomach and intestines have been discovered. A simi-
lar effect was produced in the stomach of a horse, at the
Veterinary College, from a large dose of opium, viz. three
ounces. The leaves of the belladonna were first used exter-
nally to discuss febrile and cancerous tumours, and as an
application to unconditioned ulcers, and their good
effects in this way at length induced physicians to employ
them internally for the same disorders, and we had a con-
 siderable number of well-authenticated facts, which prove
them to have been of important service. Dr. Cullen says,
"I have had a cancer of the lip entirely cured by bellad-
tonna; a febrility in a woman's breast entirely diminished
by the use of it; a sore a little below the eye, which had
put on a cancerous appearance, was much mended by the
internal use of this plant; but the patient having learned
somewhat of the poisonous nature of the medicine, refused
to continue the use of it, upon which the sore again spread,
and was painful; but upon a return to the use of bellad-
tonna, it was again mended to a considerable degree;
when the same fears again returning, the use of it was
again laid aside, and with the same consequence." The root
is much less powerful than the leaves. See Woody, I. e.
and Murray App. Med. 3. A. physaloides, Peruvian deadly
night-shade. "Stem herbaceous; leaves entire-angular; calyx-
es cloathed, acute-angular." Root annual, fibrous;
from spreading, two feet high; leaves alternate, smooth,
oblong; running down the foot-stalk; peduncles tubcularly,
foliary, naked, one-flowered; calyx ovate, deeply five-
parted; leaflets fagittate-ovate; corolla bell-shaped, slightly
five-lobed, blue, with a white eye, having five blue spots;
berry about the size of a cherry, with five sharp angles,
and inclosed in a ventricose bladder. A native of Peru.
Cultivated by Miller. 4. A. falatala. "Stem shrubby;
peduncles foliary; corollas bell-shaped; leaves lobate.
Six feet high, somewhat branched and angular; leaves alter-
ate, usually many from the buds, petioled, entire, naked;
peduncles axillary, one-flowered, fiddle-shaped, the length of
the leaves; flowers pentagon. A native of the coast of Gulf
Mexico. 5. A. arborescens, tree strppa, belladonna frutes-
cens. See. Plm. 48. t. 1. "Stem shrubby; peduncles
crowded; corollas revolute; leaves oblong." A small tree
or shrub. Leaves alternate, in tufts towards the ends of
the branches, lanceolate-ovate, acute, entire, nerved, of
a dark colour; flowers peduncled, heaped, white, fragrant,
notching; peduncles numerous, one-flowered, which;
corollas somewhat bell-shaped, narrow at the bottom, feeding
at top; filaments twice as long as the corolla. This spe-
cies is often tetradromus. A native of South America and
Jamaica. 6. A. frutescens, shrubby strppa. "Stem shrubby
and peduncles crowded; leaves co-ordinate, obtuse." Six
or eight feet high; leaves alternate, roundish; flowers come
out between the leaves on short peduncles, and resemble those
of belladonna, but much smaller, and of a dirty yellow
7. A. herbacea, herbaceous strppa, Mill. Dict. n. 3. "Stem
herbaceous; leaves obtusely, ovate, nerved, with waved edges." Root
perennial; stems channelled, about two feet high, dividing
into two or three branches; leaves four inches long and
three broad, having several transverse prominent ribs on the
under side; flowers white, bell-shaped. The seeds were
sent to Mr. Miller from Campeachy. 8. A. procumbens,
wheel-flowered strppa, Cavan. Hilp. n. 80. t. 72. "Stem
procumbent, herbaceous; leaves twin, unequal, ovate,
smooth; flowers in umbels." Root annual; stem grooved,
much branched, three feet high; leaves sharp-ovate, running
down the petiole, smooth, entire, one-curved, glaucous
beneath; common pedicule, foliary, feebly an inch in
length; rays of the umbel from two to five; corolla her-
baeous, yellow, wheel-shaped, which sufficiently diffi-
guishes it from all its congers. A native of Mexico."

Propagation and Culture. 1. Mandrake is propagated by
seeds, as soon as they are ripe, when they are to be sown
upon a bed of light earth, and occasionally refreshed with
water. In August they must be taken up very carefully
and transplanted into the places where they are to remain,
offering that the soil be light and deep, for the roots run
far down, and will grow to a large size in a few years if
not interrupted by gravel or chalk, or rotted in winter by
salt soil. The plant should also have a warm situation.
The root will remain found above fifty years, and continue
to be as vigorous as a young plant. Deadley nightshade
may be propagated both by its roots and by its seeds; it
requires a shady situation. If the seeds of the third spe-
cies be permitted to scatter, the plants will come up the
following spring, and may then be transplanted into the
borders of the pleasure garden, where they will grow to
a large size. Species 4th, &c. may be propagated by
seeds, which should be sown in a hot-bed in the spring;
and when if be removed, they should be each put into
a separate small pot filled with loamy earth, and shaded
until they take root. The 4th and 5th may be placed with
other hardy exotic plants in a sheltered situation, and in
October they must be removed into the green-hovel. The
5th, 7th, and 8th, must be kept in the dark-hovel. The
7th may be increased by parting the roots. See Martyn's
Miller's Diet.

ATROPATENE, or ATROPASSA, in Ancient Geo-
graphy, a country of Asia, occupying the north-west part of
Media, and lying between mount Taurus and the Caspian
sea. It is said to have taken its name from one Atropatus,
who, being governor of this province in the time of Darius,
the last Perian monarch, opposed Alexander the Great,
and upon the destruction of the Perian monarchy, feized
this part of Media, and transmitted it to his prosperity,
when it was a sovereign to the time of Strabo. (Geog.
lib. xi. p. 523.) It was a cold, barren, and inhospitable
country, and on that account allotted by Shahmanever for
the residence of many captive Israelites, after the conquest
of their kingdom. Its inhabitants, according to Polybius
(l. v. p. 492.), were good soldiers; and we learn from
Strabo, that its kings could bring into the field 40,000
foot and 20,000 horse. The metropolis of Atropatene
was Gaza.

ATROPHY (ἀτροφία from ἀτροφεω, privative, and ἄνθι-
v, growth), in Medicine, a defect of nourishment, and co-existent
atrophication. It differs from plethora, by being unaccom-
panied with cough, and purulent expectoration; and from
tubes, by the absence of hectic fever. This distinction,
however, of systematics writers, between tubes and atrophy
is not altogether so satisfactory as could be wished; since
atrophy in its advanced stage is often attended with a symp-
omatic fever resembling the hectic. In the fourth volume
of his First Lines of the Practice of Physic, Dr. Cullen
candidly acknowledged that he was not satisfied with his
arrangement of the several species of atrophy and tubes.
He expresses a doubt, whether the distinction attempted in
Nefatology, between the two diseases, will properly apply;
being of opinion that there are certain affections of the same
nature, which sometimes appear with, and sometimes without
fever.
A

rachitis is described with chronic tranquility. At sometimes it accompanies remission of scurvy. It is often attended with diabetes; fainting, tabes, woe, is thought. The

metallic

dicines and were

bark, jellies, mild, and manual causes, to one, the

vomitii

special

mention,

The

acrimony,

the

infusion of the red roes, the infusion of catechu, and chocolate; or if the left-named metallic preparations prove too tumultuous, the zincaum vitriolatum. In some of these cases, mild opiates, or the cicia, may also be given with advantage. Convulsions should be prevented by occasional doses of the elecurium fence, or oleum ricini, or magnesia and natrium. (See Tiffot on Osmium.) The humane means will be a qualily suited to most of the other varieties of atrophiainfanorum. When it is occasioned by profuse perspiration the sulphurous acid should be given with the other toxins; and when the urinary evacuation is excessive, the fame remedies as in diabetes; which fee. When this disorder occurs in nurses giving too much milk, the astringent vegetable substances (the Peruvian bark excepted) and metallic salts above mentioned will not be proper; a more liberal use of fermented liquor and animal food should be allowed, and the infant should be warmed. When it proceeds from a diarrhoea, opiates may be given more freely, joined with tallowious powders, and small doses of scopolium. When it is occasioned by the food being rejected from the stomach shortly after it is swallowed, the peculiar condition of that organ, on which the vomiting depends, must be ascertained and remedied accordingly. In such cases, pitchers of milk and animal jellies should be administered once or twice every day, until the disposition to inverted action is removed.

A. famelicorum. This occurs in infants at the breast, not being supplied with a sufficiency of milk. It is known by the daily emaciation of the infant, constant cries, and wakefulness, its eagerness to suck, and its tranquility and disposition to sleep after being put to the breast. It happens when the mother's or nurse's milk is either deficient in quantity, or poor and watery in its quality. It may be remedied in part by putting the mother upon a generous diet, and supplying the infant with nourishment by the spoon; but the most effectual method is to refer to a nurse capable of affording a healthier and more abundant stream of milk.

A. debillum. To this species belong the nervous atrophy, and the emaciation which accompanies old age. It depends upon a debility of the organs of digestion and nutrition. In the first instance, it is sometimes the consequence of close application to business or study, and excessive anxiety, grief, a longing after one's native country or a beloved object, with other depressing passions. In these cases, a removal from the scene of study or business, and from the source of anxiety, regular exercise and proper recreations, will form the basis of the cure. At the same time, bitters, chocolate, and opiates, should not be omitted. (Morton de Atrophia, see Phthisia nervosa.) When the disorder is the consequence of old age, much relief cannot be expected. In that case, little more can be done than to render the diet as nutritious as possible.

A. cacochymica. When the emaciation in this species is connected with a febrifugous aemony, the remedies proper for correcting the same must be employed; such as tubaoid fruits, fresh milk liquor, &c. all salted meats being strictly avoided. When it is connected with a phthisical aemony, the cure should be attempted by mercury, opium, and the guaiacum and farfacarphus decoctions, with the warm bath. When it occurs in a ricketty constitution, the same treatment as in rachitis will be proper. (See Rickets.) If this species (the A. cacochymica) is accompanied with febrifugous or phthisical fevers, it should be referred to those.

A. summata. This happens when the concordant powers are impaired or destroyed by vegetable or mineral poisons. Among the vegetable poisons which prove the cause of atrophy, may be mentioned the abuse of green tea in women, and the chewing of tobacco in men. In like manner the opium-eaters in the Levant and other parts of the east are affected with atrophy. Another poison extracted from vegetable substances undergoing fermentation, which produces the same effect, is alcohol, or brandy, rum, &c. Among the mineral poisons which have been observed to cause this disease, may be mentioned lead and arsenic. The remedies in this species of atrophy must be varied according to the kind of poison by which it was induced. (See Poisons.) In the Nosological System of Dr. Cullen, this species of emaciation is ranked under tubes; but as it is not accompanied with either glandular obstruction, or with purulence or ulceration, we have conceived it to belong to the present genus, and have accordingly introduced it here.
The last species we have to notice is the A. a compressa flavus thorace. This takes place when the thoracic duct is so compressed by a tumor or other mechanical cause; that the transmigration of the chyle through it is either partially or wholly interrupted. In the latter case it is irretrievable. Fortunately this species of atrophy is of very rare occurrence. See Morton on Phthisie; and Hoffman de Atropa, Suppl. II. 1. Aulio de Pals, His Practise of Phliie, vol. iv.

**ATROPICA**, in Entomology, a species of Mantis described by Pallas. It is a native of the island of Java; on the thorax are four spines; wing-cases short and mucronate at the base.

**ATROPOS**, a species of Sphinx, with yellow posterior wings fuscated with brown, and yellow abdomen with black rings. Varieties of this species differing in size, colour, and some peculiarities of the marks on the anterior wings, are found in Egypt, I dia, the Cape of Good Hope, America, and Europe. It is the largest of the European insects of the lepidopterous tribe, and is certainly a beautiful creature. In England this kind is rare, and is called the death's head hawk-moth, from certain characteristic and very singular marks on the thorax, by which the figure of a human skull is strongly depicted. These insects for this reason have generally been regarded as an ominous prelude of some approaching calamity by the penansy in most countries where they have appeared by chance; and Linnaeus has himself named it after one of the three fates of the heathen mythology. The larva feeds on the jasmin, potatoe, and elder; is solitary, yellow, with oblique, blue, green, and black lateral frills, and a red-ted tail; pupa reddish. Vide Donov, Brit. inf. 9. t. 289. Linnaeus in Amoen. Acad. names this insect capot mortuos: and Geoffroy in Hist. des Insectes, le phisins à tête de mort.

**ATROPOS**, is also a species of Musca, about half an inch in length, that inhabits Austria. It is rather downy; thorax with three black spots; abdomen black, with interrupted yellow bands, and margin of the segments of the same colour. Schrank Eyll.

**ATROPOS**, in Mythology, one of the Parce or Fates, whose office was to cut the thread of life.

**ATROPOS**, in Zoology, a species of Coluber, described by Linnaeus in Muf. Ad. Fr. & Gmel. Syt. Nat. as having 131 abdominal plates, and 69 subcaudal scales. It is a native of America, and deemed an extremely poisonous serpent; the colour hoary grey, with a quadruple series of brown ocellated spots, each with a white or red margin. The head is heart-shaped, gibbous, with four and sometimes more black spots; and the scales are lanceolate. Gmel. It is cobra atrope of Laur. Amph.

Dr. Shaw observes that this species is of a thick and short form, scarcely exceeding fifteen or sixteen inches in length; the head is large and vipersine, marked with four or five large dusky spots, and covered with small scales; the remainder of the animal of a pale brown, marked all along the upper part by four rows of very large, alternate, round, black spots bordered with white; the abdomen all-colour, and tail very short, measuring about a ninth part of its whole length; the scales on all the upper parts are of a slightly flattened form, and carinated. Gen. Zool. v. 3. p. 2. 404.

**ATRO-VIOLESCENS**, in Entomology, a species of Chrysonara, once taken in the month of September, in the county of Norfolk. It is ovate, violaceous-black; wing-cases frigated; legs pitchy-black. Morsh. Ent. Brit.

**ATROVIRENS**, in Zoology, a species of Coluber, described by the count de Cepede under the title of "la coeleuvre verte et jaune;" and by Dr. Shaw, under that of coluber atrovirens. C. atroviereus, flavo maculates, abdomen flavo, lateribus nigro punctata. Black-green snakes, speckled with yellow; the abdomen yellow, with a row of black spots down each side. French snakes.

"This seems," says Dr. Shaw, "to be the species figured by Albrudanus, under the name of anguis Zefulafii eigen, and which appears to have been so little attended to by modern naturalists, as to have been generally confounded with the ringed snake (C. atroxi), till it was again brought to notice by Norbl. Daubenton, and afterwards by the count de Cepede, who has accurately described it, and who informs us that it is very frequent in some of the provinces of France, being found in woods and moist sandy places; in its general form and appearance it resembles the ringed snake or natrix, but differs in colour, being of an extremely dark or blackish green, so as to appear black on a cursory view, the sides being marked by numerous rays of yellow spots of different forms, some oblong and some square, and which form somewhat more decided or difficulty marked stripes towards the head; the eyes and edges of the mouth are bordered with yellow scales; the abdomen is also yellow, each segment being marked on each side by a black speck. This snake is an animal of a perfectly harmless nature, and like the ringed snake, is capable of being tamed to a considerate degree." On the approach of winter, it retires, like the latter, into subterraneous retreats, and pauses that silence in a state of torpidity, from which it recovers in the spring, when it calls its skins, and appears in its highest beauty.

**ATRAX**, in Zoology, a kind of Coluber, which according to Linnaeus is particularly characterized by having 169 abdominal plates, and 69 subcaudal scales. Annae. Acad. This species is of a native of Asia, and is about a foot and a half in length; the colour hoary; scales carinated; beneath marked with dark brown, transverse, alternate spots; head depressed, compressed, angular, and covered with minute scales. Gmelin makes "clapas indica" of Laur. Amph. a variety of this species. Dr. Shaw describes it in his Gen. Zool. as being the "grey brown snake," with transverse line whitish stripes, and dusky abdomen, with white transverse variegations; and names it the *saxe* snake. This author also notices one error of Linnaeus respecting this species that deserves particular remark. "In the Museum Adolphi Friderici, p. 33," says he, "this species is, by a mistake, incribed anguina, while the figure on plate 22 of that work, represents the body marked by several dilatant, narrow, transverse whitish bands reaching to the abdomen, which is spotted with small, round, white specks; the dusky transverse spots appearing only beneath the tail; the general colour of the abdomen, however, in this snake is rather deep brown or blackish, beautifully variegated or marbled by numerous narrow transverse bands, accompanied here and there with small spots; the tail is remarkably short and slender. In the Syntome Naturalis a mistaken reference appears to be made to a figure in Seba representing a very different species. The C. atrax is a poisonous snake, and is a native of the island of Ceylon."

**ATSHARES**, in Geography, a tribe of the Mandshurees, who inhabited the banks of the middle Amur, in Siberia, before it was taken possession of by the Russians. They then subsisted in a state of independence; but they were afterwards removed, by order of the Chinese government, from the Amur farther towards China.

**ATTACAMA**, in Geography, one of the fourteen juridictions belonging to the archbishopric of Plata, in the audience of Charcas, in South America. It is the western boundary of the audience, extending to the South sea; and
and the principal town, called also Attacama, is not less than 120 leagues from Plata. Its jurisdiction is of a considerable extent, and a great part of it very fruitful; but interspersed with some deserts, particularly towards the south, where it divides the kingdoms of Peru and Chili. On the coast in this province there is annually a very large fishery of Tello, a fish common in the South Sea, with which a very great trade is carried on with the adjacent provinces, this being the chief food in Lent and other days of abstinence. There is a great defect of the same name, and a chain of mountains, which separate Peru, on the north, from the province of Quito. The cold in these mountains is sometimes so extremely severe, that those who pass it are occasionally frozen to death. S. lat. 22° W. long. 5° 20′.

ATTACANA, in Ancient Geography, s town of Asia, in greater Armenia. Procopiv.

ATTACCO, in Myth., is a kind of short subject or point, not restricted to all the laws of regular fuses. Sam wise, it is a section of the principal theme itself, treated rather as an imitation than a subject of regular fuses, and may be answered in any interval, at pleasure.

Example.

ATTACHIAMENTA BONORUM, in Law, a distress taken upon goods or chattels, where a man is sued for personal estate or debt, by the legal attachators or bailiffs, as security to answer an action.

ATTACHIAMENTA DE SPINIS ET BOSCO, is a privilege granted to the officers of a forest to take to their own use thorns, bruits, and wind-falls, within their own precincts.

ATTACHING, or ATTACHMENT, denotes the apprehending a person or thing, either by a precept or writ. The word is formed of the French attachers, to fasten or tie; and that from the corrupt Latin attaches, of attesse, to associate to; or rather, as others think, from the Celtic tach, a nail; and tach a, to nail; or the Saxon tacean, to take.

Lambard makes this difference between an arrest and an attachment; that an arrest proceeds out of an inferior court by precept only, and an attachment out of a higher court, either by precept or writ; and that a precept to arrest hath the formal words, duci facias, &c. and a writ of attachment these, "precipimus tibi quod attachias talem, & habeas eum coram nobis.

By this it appears, that he who arrests carries the party arrested to another higher person, to be disposed of forthwith; whereas he that attaches keeps the party attached, and presents him in court at the day assigned in the attachment.

There is this further difference that an arrest lies only upon the body of a man; and an attachment sometimes on his goods too; for a man may be attached by an hundred fuses.

Moreover, attachment is a process from a court of record, awarded by the justices at their discretion, on a bare segglion, or on their own knowledge; and is properly grantable in cases of contempt, against which all courts of record, but more especiafly those of Westminster-hall, and above all the court of B. R. may proceed in a summary manner.

The contempt that are thus punished, are either direct, which openly inflicts or refit the powers of the court, or the persons of the judges who preside there; or else are consequential, which, without such gross insolvency or direct oppression, plainly tend to create an universal disregard of their authority. The principal instances of either sort that have been usually punishable by attachments, are of the following kinds: 1. Those committed by inferior judges and magistrates by acting unjustly, oppressively, or irregularly, in administering those portions of justice which are entrusted
ATT

...trusted to their distribution; or by disobeying the king's writs issuing out of the superior courts, by proceeding in a case after it is put a file to or removed by writ of prohibition, certiorari, error, supersedeas, or the like. 2. Those committed by sheriffs, bailiffs, gaolers, and other officers of the court, by abusing the process of the law, or deceiving the parties, by any acts of oppression, extortion, collusive behaviour, or culpable neglect of duty. 3. Those committed by attorneys and solicitors, who are also officers of the respective courts, by gross instances of fraud and corruption, injustice to their clients, or other dishonest practice. 4. Those committed by jurors in collateral matters relating to the discharge of their office; such as making default when summoned, refusing to be sworn, or to give any verdict, eating or drinking without the leave of the court, and especially at the cost of either party; and other irregularities of a similar kind; but not in the mere exercise of their judicial capacities, as by giving a false or erroneous verdict. 5. Those committed by witnesses; by making default when summoned, refusing to be sworn or examined, or prevaricating in their evidence when sworn. 6. Those committed by parties to any suit or proceeding before the court; as by disobedience to any rule or order made in the progress of a cause; by non-payment of costs awarded by the court upon a motion; or by non-ob servance of awards duly made by arbitrators and umpires, after having entered into a rule for submitting to such determination. 7. Those committed by any other person under the degree of a peer; and even by peers themselves, when enormous and accompanied with violence, such as forcible refusals, and the like; or when they import a disobedience to the king's great prerogative writs of prohibition, habeas corpus, and the like.

Some of these contempts may arise in the face of the court; as by rude and contumelious behaviour; by obfucnity, perseverance, and preparation; by breaking the peace, or any wilful disturbance whatsoever; others, in the absence of the party; as by disobeying, or treating with disrespect, the king's writ, or the rules or process of the court; by perverting such writ to the purposes of private malice, extortion, or injustice; by speaking or writing contemptuously of the court, or judges acting in their judicial capacity; by printing false accounts (or even true ones, without proper permission) of causes then depending in judgment; and by any thing, in short, that demonstrates a gross want of that regard and respect, which, when once courts are deprived of, degrade and destroy their authority among the people. The process of attachment for these and similar contempts must necessarily be as ancient as the laws themselves; for laws, without a competent authority to secure their administrations from disobedience and contempt, would be vain and nugatory. This has accordingly been exercised as early as the annals of our law extend.

If the contempt be committed in the face of the court, the offender may be instantly apprehended and imprisoned, at the discretion of the judges, without any further proof or examination. But in matters at a distance, and of which the court cannot have so perfect a knowledge, unless by the confession of the party, or the testimony of others, if the judges upon affidavit fee sufficient ground to suspect that a contempt has been committed, they either make a rule on the suspected party to shew cause why an attachment should not issue against him; or in very flagrant instances of contempt, the attachment issues in the first instance; as it also does, if no sufficient cause be shewn to discharge, and therefore the court confirms and makes absolute the original rule. This process of attachment is merely intended to bring the party into court; and when there, he must either stand committed, or put in bail, in order to answer upon oath to such interrogatories as shall be administered to him, for the better information of the court with respect to the circumstances of the contempt. These interrogatories are in the nature of a charge or accusation, and must by the course of the court be exhibited within the first four days; and if any of the interrogatories is improper the defendant may refuse to answer it, and move the court to have it stricken out. If the party can clear himself upon oath, he is discharged; but, if perjur'd, may be proceeded for the perjury. If he confesses the contempt, the court will proceed to correct him by fine or imprisonment, or both, and sometimes by a corporal or infamous punishment. If the contempt be of such a nature, that when the fact is once acknowledged, the court can receive no farther information by interrogatories than it is already poss'd of (as in the case of a refusal), the defendant may be admitted to make such simple acknowledgement, and receive his judgment, without answering to any interrogatories; but if he wilfully and obstinately refuses to answer, or answers in an evasive manner, he is then clearly guilty of a high and repeated contempt, to be punished at the discretion of the court. Blackstone's Com. vol. iv.

The terrors of attachment in case of disobedience on the part of unwilling witnesses, as well as the compulsory processes for obtaining their attendance, are of excellent use in the thorough investigation of truth: and upon the same principle, in the Athenian courts, the witnesses who were summoned to attend the trial, had their choice of three things, either to swear to the truth of the fact in question, to deny or abuse it, or else to pay a fine of a thousand drachmas.

**Attachment**, *Writ of*, called also *Pons*, is a writ issuing out of the court of Common Pleas, and grounded on the non-appearance of the defendant at the return of the original writ; which commands the sheriff to attach him, by taking gage, that is, certain of his goods, which he shall forfeit, if he doth not appear; or by making him find sure pledges or sureties who shall be amerced in case of his non-appearance. This is the first and immediate process, without any previous summons, upon actions of trespass *vi et armis*, or for other injuries, which, though not forcible, are yet trespasses against the peace, as deceit and conspiracy; where the evidence of the wrong requires a more speedy remedy, and therefore the original writ commands the defendant to be at once attached, without any precedent warning. See Process.

**Attachment out of Chancery**, is a writ in the nature of a *copias*, directed to the sheriff, and commanding him to attach, or take up the defendant, and bring him into court. It is had of course, upon an affidavit made that the defendant was served with a *fulfana*, and appears not; or it issueth upon not performing some order or decree.

After the return of this attachment by the sheriff, *good non ef inmellus in balion far*; another attachment, with proclamations, if issues: which, besides the ordinary form of attachment, directs the sheriff that he cause proclamations to be made, throughout the county, to summon the defendant, upon his allegiance personally to appear and answer; and if this be also returned with *sef erit inmellis*, and he still standeth in contempt, a committal of rebellion is awarded against him. See Commission of Rev. Alien.

**Attachment, Foreign**, is an attachment of goods or money found within a liberty or city, to satisfy some creditor within such city or liberty.

Under the eulom of London, if a plaint be exhibited in the mayor's or the sheriff's court (the proceeding in the former being the most advantageous) against A, and the process be returned
A

ATT

or would influence the court, if the plaintiff in the original action shall not disprove it within a year and a day; now if the plaintiff in the action below doth not set forth such conditional judgment given by the court, it is wrong, because he hath not set being his case within the culmum. Vide 2 Law. 875.

A sum of money was to be paid to Michaelmas, and it was attached before that day; adjudged, that a foreign attachment cannot reach a debt before it due; therefore, though the judgment on the attachment was after Michaelmas, yet the money being attached before it was due, it is for that reason void. Cro. Eliz. 184. For further matter, see Com. Dig. tit. Attachment.

Money due to an execution or administrator, as such, cannot be attached. It would give a simple contract creditor priority over judgments. Fisher v. Lane and others, 3 Will. 297. Nor trust money in the hands of the garnissees.

Debtor and creditor being both citizens of London, the debt was delivered several goods to the EXETER carrier then in London to carry and deliver them to Exeter, and the creditor attached them in the hands of the carrier for the debt due to him from his debtor; adjudged, that the action should be discharged, because the carrier is privileged in his person and goods, and not only in the goods which are his own, but in those of other men, of which he is in possession, for he is answerable for them. 1 Leon. 189. See Jacob's Law Dict. by Tomlins, art. Attachment.

Attachment of the Forrest, or Woodsmote, is one of the four courts held in the forest. (See Courts of Forrest, &c.) The court of attachments seems so called because the verderors of the forest have therein no other authority, but to receive the attachments of offenders against vert and venison taken by the foresters, to enrol them, and to certify them under their seals, to the court of justice-rect, or sweinmote; for this court can only inquire of, but not convict offenders.

This attachment is by three means; by goods and chattels; by body, pledges, and mainprize; or by body only. Offenders may be attached by their bodies, if taken with the mainprize (or mainouvre, a main), that is, in the very act of killing venison, or stealing wood, or preparing to do, or by fresh and immediate pursuit after the act is done; otherwise, they must be attached by their goods. This court is held once in every forty days throughout the year; whence it is also denominated forty days court.

Attachment of Privilege is, by virtue of a man's privilege, to call another to that court whoso he himself belongs, and in respect whereof he is privileged to answer some action: or, it is a power to apprehend a man in a place privileged. Corporation courts have sometimes power by charter to issue attachments, and some courts-baron grant attachments of debt. Kitch. 79.

ATTACK, an attempt upon any person or thing; or the act of beginning a combat or dispute.

Attack, in the Military Art, signifies an engagement having for its object the forcing of an entrenched post, or dilagrading an attacking army from its lines, when in a situation calculated to impede the progress of an invading army.

War is naturally an offensive operation. In the earlier ages we find it carried on by a series of engagements uniformly on the principle of attack, and unconnected with any of those skilful manœuvres which the ready genius of mankind has since carried into execution for their mutual destruction.

The ultimate object of a battle confined in plundering, in the case of successe, a small tract of the enemy's country, and
ATTACOTTI, in Ancient History, a savage people of Great Britain, mentioned by Aminius Marcellius (l. 27, c. 8) and St. Jeron (tom. ii. p. 751), as well as in the Notitia Imperii, whose situation is not precisely ascertained by antiquaries. Some have supposed that they inhabited Wales, and allege, that their name was derived from the British words "at a coast, or coed," signifying amongst woods. But it is probable, that they were seated somewhere further north.
north than any part of Wales; for Ambrianus Marcellinus
represents them as allies and confederates of the Scots and
Picts, and therefore they were probably their neighbours.
Their enemies, and afterwards the soldiers, of Valentian,
are accused, by an eye-witness, of delighting in the taste of
human flesh. When they hunted the woods for prey, it is
said by Erasmi (ubi supra), that they attacked the shepherd,
rather than his flock; and that they cunningly selected the
most delicate and brawny parts of male and females,
(puerorum nato et familiae papillas, which they prepared
for their horned part.)

ATTAGEN, ATTAGAS, in Ornithology, names given by
Burk and Buff to the red or moor-goose, or red goose, in
Gmelin's arrangement the fourth variety of Uni alega y
Linn. & Cimh. Buff also calls them Attas of Gmelin
university Pennsylvania.

ATTAINER, in Law, is that man or woman which is
accused by a man who has committed felony, treason, or
other crime, and who is capitally convicted for the same.
This, by the common law, is the immediate inferrable
consequence of the sentence of death that is pronounced.
The law, in this case, casts a note of infamy upon the cri-

minal, puts him out of its protection, and takes no further
care of him than barely to see him executed. He is then
called attainted, attitatus, smacked or blackened. He is no
longer of any credit or reputation; he cannot be a wit-ness
in any court; neither is he capable of performing the
functions of another man: for, by an anticipation of his
punishment, he is already dead in law. This is after
judgment; for there is a great difference between a man
convicted, and attainted; though they are fre-
quently, through inaccuracy, confounded together. After
judgment only, a man is liable to none of these disabilities:
for, in the conformation of law, there is still a possibility of
his innocence. Sometimes may be offered in arrest of judg-
ment; the indictment may be erroneous, which will render
his guilt uncertain, and thereupon the present conviction may
be quashed; he may obtain a pardon, or be allowed the
benefit of clergy; both which suppose some latent sparks of
merit, which plead in extenuation of his fault. But
when judgment is once pronounced, both law and fact con-
spire to prove him completely guilty; and there is not the
remotest possibility of any thing to be said in his favour.
Upon judgment, therefore, of death, and not before, the
attainted of a criminal commences; or upon such cir-
stances as are equivalent to judgment of death; as judg-
ment of outlawry on a capital crime, pronounced for
feasong or fleeing from justice, which tacitly confesses
the guilt. And, therefore, upon judgment of outlawry,
or of death, for treason or felony, a man shall be said to be
attainted.

A man is attainted by appearance or by process. “At-
tained” on appearance is by confession, or verdict, &c.,
by confession, when the prisoner, upon his indictment, being
asked whether guilty or not guilty, answered himself guilty,
without putting himself upon his country; and formerly
confession was allowed before the coroner in inquest,
upon which the offender was to aby the realm, and this
was called “attained” by abi juris. “Attained” by verdict,
is when the prisoner at the bar pleadeth not guilty,
and is found guilty by the verdict of the jury of life and
death. “Attained” by process, otherwise called “atten-
dant” by default or by outlawry, is when a party flies, and is
not found, and he hath been five times publicly called
or proclaimed in the county, and, at last, upon his default,
is pronounced or returned outlawed. Staunf. Pl. Co. 44.
122. 182. Perons may also be attainted by act of parlia-
ment. Accordingly acts of attainder have been passed in
several reigns, on the discovery of plots and rebellions, from
the reign of Charles II., when an act was made for the
attainder of several persons guilty of the murder of
King Charles I. to this time. Among thes, the most
remarkable is that for attainting John Bye for
conspiring against King William; this act having been made
for attainting and convicting him of high treason on the
oath of one witness, just after a law had been passed, that
no person should be tried or attainted of high treason, where
corruption of blood is incurred, but by the oath of two
lawful witnesses, unless the party confess and make, &c.,
Stat. 7 and 8 W. III. c. 3. However, in John Bye was
indicted of treason, on the oath of two witnesses, though
only one appeared against him on his trial; and it was al-
lledged, that though the jury had agreed with and prevailed on one
of the witnesses to withdraw.

The consequences of “attainted” are forfeiture, and cor-
ruption of blood; which latter cannot be regularly taken
out but by act of parliament. See these articles.

“Attained” may be reverted or falsified by writ of error,
or by plea; in the former case it must be by the
King's leave, &c.; and in the latter it may be by denying the
treason, pleading a pardon by act of parliament, &c.
3 Inf. 232.

By a king's taking the crown upon him, all attainders of
his person are “ipso facto” purged, without any reversion.
1 Inf. 26. Finch L. 82. Wood. 17. This was the de-
claration of parliament, made in favour of Henry VII.

ATTAINER, Bill of, is a bill brought into parliament
for attainting, condemning, and executing a person for high
treason. See ATTAINER.

ATTAIN,attoin, in Law, a writ which lies to
inquire, whether a jury of twelve men gave a false verdict,
and this must be brought in the lifetime of him for whom the
verdict was given, and of two at least of the jurors who gave
it. This lay, at the common law, only upon writs of aflict;
and seems to have been coeval with that institution by
King Henry II. at the instance of his chief justice Glanvil;
being probably meant as a check upon the vast power then reposed
in the recognizors of aflict, of finding a verdict according to
their own personal knowledge, without the examination of
witnesses. And even here it extended no further than to
such instances, where the aflict was joined upon the very
point of aflict (the heirship, deditinn, &c.), and not on my
collateral matter, as villages, barony, or any other dis-
puted fact. (See Annexa in juramento, &c.) It seems that
no attaint lay against the inquest or jury that determined such
collateral issue; nor did such a process obtain after the trial
by inquest or jury, in the old Norman or feudal actions
prosecuted by a writ of entry; nor did any attaint be
in trespas, debt, or other action personal, by the old common
law; because these were always determined by common
inquests or juries. At length the statute of Writs. 1
(3 Edw. I. c. 38.) allowed an attaint to be sued upon in-
quells, as well as aflicts, which were taken upon any plea
of land or of freehold. But this was at the king's dis-
cretion, and so it is understood by the author of Pleta, a
writer contemporary with the statute; though Sir Edward
Coke (2 Inst. 130. 237.) seems to hold a different opinion.
Other subsequent statutes, 1 Edw. III. III. 4. 5 Edw. III.
4. 7. 28 Edw. III. 5. 8.) introduced the same remedy in all
pleas of trespas; and the statute 34 Edw. III. c. 7. extended
it to all pleas whatsoever, personal as well as real; except-
ing only the writ of right, in such cases where the
mile or aflict is joined on the mere right, and not on any collateral
question.
ATT

question. For though the attaint seems to have been generally allowed in the reign of Henry II., at the first introduction of the grand assize (which at that time might consist of only twelve jurors, in cases they were all unanimous), yet sufficient authorities have favored that attaint be not a false verdict given at the mere will of the party accused, or by the common law; or by statute, because that is destructive of the grand assize, opposed to the party himself, and a most confounding of five or six jurors. Bract. 25. 2 Mat. 27. Britt. 245. 2 Inst. 256. 7. Co. Abr. Attain. 45. 1 Roll. Abr. 280.

The jury are the only persons who may try this false verdict must be twenty-four, and are called the grand jury; for the law will not that the oath of the jury of twelve men should be attainted or fat aide by an equal number, nor by less indeed than double the former. Bract. 1. 4. tr. c. 5. § 5. 1. Hl. 1. 5. c. 22. § 3. If the matter in dispute be of forty pounds value in persons, or of forty shillings a year in lands and tenements, then by Stat. 15 Hen. VII. c. 5. each grand juror must have freehold to the annual value of twenty pounds. And he that brings the attaint can give no other evidence to the grand jury than what was originally given to the petit. But those against whom it is brought are allowed, in absence of the first verdict, to produce new matter; because the petit jury may have formed their verdict upon evidence of their own knowledge, which never appeared in court. If the grand jury found the verdict a false one, the judgment by the common law was, that the jurors should lose their "liberum legem," and become for ever infamous; should forfeit their goods and the profits of their lands; should themselves be imprisoned, and their wives and children thrown out of doors; should have their hoes razed, their trees extirpated, and their meadows ploughed; and that the plaintiff should be restored to all he lost by reason of the unjust verdict. But as the severity of the punishment had its usual effect in preventing the law from being executed, therefore by the statute 11 Hen. VII. c. 24. revived by 25 Hen. VIII. c. 3. and made perpetual by 15 Eliz. c. 25. an attaint is allowed to be brought after the death of the party, and a more moderate punishment was inflicted upon attainted jurors; viz. perpetual infamy; and if the cause of action were above forty pounds value, a forfeiture of twenty pounds a-piece by the jurors; or if under 40l. then five pounds a-piece; to be divided between the king and the party injured. So that a man may now bring an attaint either upon the statute or at common law, at his election (3 Inst. 164); and in both of these may revoke the former judgment. But the practice of filing aside verdicts upon motion, and granting new trials, has so superceded the use of both forts of attaints, that few instances of attaint occur in our books later than the sixteenth century. Cro. Eliz. 359. Cro. Jac. 92. By the old Gothic consititution, indeed, no certificate of a judge was allowed, in matters of evidence, to counterview the oath of the jury; but their verdict, however erroneous, was absolutely final and conclusive. Yet there was a proceeding, from whence our attaint may be derived. If upon a lawful trial before a superior tribunal, the jury were found to have given a false verdict, they were fined, and rendered infamous for the future. Stierhoun de jurid. Nat. l. 1. c. 4. Blackstone's Comm. vol. ii. p. 302, &c.

ATTAINED, ATTAIN'T, or ATTINCTUS, in Law.

See Attainder.

ATTAK, in Geography, the largest of the islands commonly denominated the Aleutian or Aleutian islands. It seems to have a larger extent of surface than Behring's island, and has an oblong form, lying more w. and e. In these islands no volcanic traces have been discovered, and here are no land animals but ice-foxes and rock-foxes, more frequently blue than white. The fea-otters come hither but singly; whereas fox-foxes, sea-bears, manadis, and some other bears frequent these shores in herds. See Aleutian Islands.

ATTALLIA, in Ancient Geography, a town of Asia, in Phrygia, on the coast of the sea, which then formed a gulf of the same name, now called the gulf of Satara. Strabo (1. xiv. p. 439.) says that it was built by Attalus Philadelphus, king of Pergamus, who founded a colony there, and that it was the chief residence of the priest. St. Paul proceeded from Perga to this town. Acts xiv. 25.

—Alb. a town of Asia, in Lydia.

ATTALIC Z VESTES, in Antiquity. Garments made of a kind of cloth of gold.

They took the denomination from Attalus, surnamed Philadelpbus, a wealthy king of Pergamus, who was the first, according to Pliny, who procured gold to be woven into cloth. Hill. Nat. lib. iii. cap. 48.

ATTALIS, in Ancient Geography, the name of a tribe of Attica.

ATTALUS, in Biography, the name of several kings of Pergamus.—Attalus I. succeeded his cousin Eumenes I. in the year 234 B.C. Having expelled the Gauls who had settled in his country, he assumed the title of king, and extended his conquests of the Atlantic provinces as far as Mount Taurus. But in the foregoing, in which he was surrounded by the united forces of his grandfather Attalus and Seleucus, he availed himself of the favour afforded him by the Gauls settled in Thrace, and recovered his dominions of which he had been disappointed. He then purified his conquests in Asia, till his career was stopped by the refusal of the Gauls to advance any farther. Upon this he returned to the Hellespont, and allowed his allies to settle there in a very fertile and extensive region. For the security of the territories he had acquired, he formed an alliance with the Romans, whom he vigorously assisted in their two wars against Philip of Macedon. In conjunction with the Athenians he invaded Macedonia, and recalled Philip from his enterprises against Athens; and on this account the Athenians gave his name to one of their tribes. At Thebes in Boeotia, whilst he was haranguing the people, and urging them to take arms against Philip, he was seized with an apoplexy; and being conveyed to Pergamus, he soon after died, in the 72d year of his age, and 43d of his reign. He is regarded as a generous and amiable prince, a liberal encourager of literature, and also a writer. Of his veneration for Homer the following singular infallibility is mentioned by Suidas and Valerianus Maximus; viz. his causing the grammarians Daphnidas to be thrown from a rock, for speaking disrespectfully of this celebrated bard.—Attalus II. was the second son of Attalus I. and called Philadelphus, from his fidelity and affection to his brother Eumenes, who was king of Pergamus before him. Upon a false rumour of the death of Eumenes, he hastily assumed the regal insignia, and married his brother's wife; but on his brother's safe return, he manifested every token of satisfaction and allegiance, and gave an alms as one of his guards. Eumenes kindly embraced him, and in a whilper cautioned him "not again to be in such haste to marry his wife, till he was sure of his death." Attalus was actively attached to the Romans in their war against Perseus; and made successive visits to Rome for the purpose of exculpating his brother from the charge of indifference to their interest. At his death, Eumenes bequeathed both his kingdom and his wife to Attalus; and appointed him guardian of his infant son, which truth he faithfully executed. At
Attalus commenced his reign in the year 159 B.C. and after a reign of 21 years, distinguished principally by his successes in followling Ariarathes VI. to the throne of Cappadocia, and by his conduct with Ptolemy king of Bithynia, which terminated after alternate defeats and successes in the determination and annihilation of this prince, he died in his 82d year. He was a patron of literature, acknowledged as the founder of two cities in Asia, viz. Attalus and Philadelphia, and esteemed much by the Romans, by whom he was considered as one of their most faithful allies.—Attalus III. was the son of Eumenes II. and succeeded his uncle in the year 133 B.C. His disposition was cruel and fuperciscious, and led him to sacrifice most of his own family, and several persons of distinction in his court, with their wives and children. From his real or affected love for his mother Stratonia, he was denominated Philometor. After filling his capital and kingdom with deplorable diffrecs, he retired into solitude, and leqquiered from all social intercourse, devoted himself to the culture of a garden, in which he planted a variety of poisonous herbs and thickets. He occasionally sent packets, mixed with poisons, to those who were the objects of his gloomy fulnecion. This conduct indicates infanticide; but it has been ascribed by Varro and Columella to a fondness for horticulture, and the study of medicinal simples; and Attalus has been numbered among those who wrote on these subjects. By the heat and toil which he experienced in the chemical employment of cating a plant of his mother, he was thrown into a fever, which terminated his life and reign in the year 133 B.C. The Roman people were by his testament left the heirs of his goods, which they interpreted to mean his dominions and subjects. Their claim to this rich inheritance was contested, but at length established. The wealth of Attalus seems to have been a proverbial expression, and is frequently alluded to by the Roman poets. Gen. Diog. See Pergamum.

Attalus, a Christian martyr, was a native of Pergamus in Phrygia, and fell a sacrifice to persecution at Lyons, in the 177th year of the emperor Marcus Antoninus, and the 177th year of our Lord. In an epistle of the churches of Vienne and Lyons, addressed to the churches of Asia and Phrygia, containing a relation of the sufferings of their martyrs, Attalus is denominated “the pillar and support of the churches there,” and a zealous champion for the truth. He was led round the amphitheatre with a board carried before him, on which was inscribed, “This is Attalus the Christian:” whilst the people were incessant inexpressing their great indignation against him. For the gratification of the people he was delivered to the wild beasts, and after having been run through with a sword, he was set in an iron chair and burned to death. The conduct of Attalus, as well as that of his fellow-sufferers, manifested a fortitude that was invincible. Eusebius, l. v. Prep. c. 1. Lardner’s works, vol. vii. p. 225, &c.

Attalyda, in Ancient Geography, a town of Asia, in Lydia.

Attaminitus, in Entomology, a species of Scarabæus, with the thorax black and glabrous; head tuberculated; wing-cases tachaeous, with five black spots on each. Marham’s Ent. Brit. Panzer names this little insect S. inquinatus, Ent. Germ.

Attar of Roset. See Ottar.

Attarsoak, in Zoology, a name assigned by Cramer (Gréb. p. 163.) to the species of Phoca, groenlandica, or harp seal of Pennant. See Groenlandica.

Atteladois, in Entomology, a species of Carabus that inhabits Coromandel, and is about the size of the European species leuchothalamus. It is apterus and black, with a narrow thorax; the posterior part of the head attenuated; wing-cases furred and truncated. Fabricius.

Atteladois, a species of Cirriulio that inhabits Brazil. The shells are rough, variegated with brown and gray; legs variegated; and thighs elavate. It is thus specifically defined by Fabricius: ‘ corrutry chryfomela unihabulentis’ black and wing-cases with a single tubercle.

Atteladois, a species of Rhinocer at that inhabits the pine. It is downy; antennæ and legs tachaeous. A native of Sweden. Gmel. &c.

Atteladois, a species of Formica of a black colour; two spines on the thorax; legs ferruginous; posterior part of the head attenuated. Fabricius. Habits Brazil.

Atteladois, a species of Cimex (Reduvius Sect.), found in New Holland. It is tachaeous, varied with black; anterior part of the thorax tachaeous, with two black teeth. Fabricius. The femur is pale, with a black dorsal line; a black band in the middle of the thorax; anterior margin of the wing-cases black; wings black; body tachaeous beneath; thighs annulated with black.

Attelabus, a genus of Coleopterous insects in the Linnaean syltem, that is distinguished by having the head inclined and pointed behind; antennae moniliform, and thickset near the end. Linn. &c.

Of this genus, Gmelin enumerates thirty-four species, including the Fabrician cler, and fpondyloides described in Spec. Inf.—Fabricius in his Ent. Syfl. describes thirty-three species of the attelabi exclusively; his character of the genus is, feelers filiform; jaws bifid; lip horny, concealing the feelers; antennæ moniliform, and situated on the back. This genus Linnaeus observes is very obscure, the insects arranged under it differing much from one another in their external appearance. But this obscurity a later writer remarks, “proceeds rather from Linnaeus not having known a sufficient number of insects proper to be arranged under it; and his placing with these, the species included in the Clerus genus by Geoffroy, in which the general characters they affign to his attelabli are not found, than to any defect in the characters themselves.” Seecoli distinguishes the attelabi by the following character; hinder part of the head gradually diminishing in size; eyes prominent; thorax somewhat broader than the diameter of the head, and of a cylindrical form. Among these are included some of the Linnaean chryfomela, whose bodies are oblong and narrower than the thorax. The clerus of Geoffroy and Schefierler is partly taken from the Linnaean attelabi, and partly from the derneelest of that author; the characters they affign to are, antennæ club-formed, and placed on the head; the knob composed of three joints; no proboscis; thorax almost cylindrical, and without margin; foles of the feet fponggy.

The body of the insects in the genus attelabus is commonly of an ovate form; the head projecting, ovate, and narrow behind, where it unites with the thorax; the eyes are globule and situated in front; the antennæ short and approximate, moniliform, and composed of eleven joints, of which that at the base is large, and the three at the extremity form an oval of a somewhat lengthened shape; thorax and femur are both redunated; wing-cases as long as the abdomen, and rather convex; legs short and the feet of four joints. The insects of this genus approach very nearly to les brachicères, les bresters, les rhinocéraes, les macrocéphales, and les bruches of modern French naturalists, but are sufficiently distinguished by their antennæ.
The larvae of the adelabri, according to some writers, are furnished with fix feet; are very fat, of a whitish colour, and have an amuleted body. The head is protected by a hard finely covering, and the mouth furnished with two very strong jaws, with which it does great mischief. It attacks the leaves, the flowers, the fruits, and even the stalks and roots of different plants; but most of the species penetrate into the plant, and sufficiet ently on the parenchyms or spongy parts within. Preparatory to the transformation to the pupa state, some species spin a silken web, and others form a little ball of a very solid kind, in which they remain during the second state. The perfect insects inhabit the same places as the larva, but are deemed less injurious to them.

Gmelin, as before observed, describes thirty-four species of this genus: these are coriyl, avellana, bicolor, denigratus, clyrothorpus, bipululatus, gemmatus, indicus, tecnomoides, furaminus, pennyalvus, melanurus, angulatus, ruicollis, pubefcens, betula, mutillarius, dubius, laevis, formicarius, fphagus, fenticatus, quadrinaculatus, unisfaciatus, ecb-punctatus, tricolor, bifaciacius, fpylus, annulus, aparatus, cyanus, erasiformis, cerambochis, horta, etc., which see respectively.

Obj. A few of the figures in the third entomological plate of this work having been inadvertently misplaced, the insect described g. 15. atticulans will be found to belong to another genus, and that marked g. 13. bruchus being one of the Linnaean atticulans, may serve to illustrate this genus, till another figure can be given.

ATTENBEA, in Ancient Geography, an island in the Mediterranean sea, on the coast of Lycaia. Ptolemy calls it Attilubia, and places it on the coast of Pamphilia. Pliny.

ATTELAN.E. See ATTELLAN.E.

ATTENA, in ancient Geography, a town of Ethiopia, below Egypt. Pliny.

ATTENBY, in Geography, a town of Sweden, in the island of Oeland.

ATTENDANT, or ATTENDENT, in a general sense. See Assistant, Retinue, and Satellite.

ATTENDANT, in Anatomy, Attendent, in Laze, signifies that one owes duty, or service to another, or depends in some manner upon him.

Where the wife is endowed of lands by guardian, the shall be attendant on the guardian, and on the heir at his full age.

ATTENDORN, in Geography, a town of Germany, in the archiepiscopal of Cologne, and duchy of Welfphalia, seated on the river Bigge, and seven leagues south of Arenberg.

ATTENHOVE, a town of Brabant, one league north-east of Larden.

ATTENTION, Attention, compounded of ad, to, and tendo, I stretch, a due application of the ear, or the mind, to any thing said or done, in order to acquire a knowledge of it.

Attention of mind, is not properly an act of the understanding, but rather of the will, by which it calls the understandings from the consideration of other objects, and directs it to the thing in hand. Nevertheless, our attention is not always voluntary: an interesting object seizes, and fixes it beyond all power of control.

It is by the attention that is given to any object of sense or intellect, that we form a distinct notion of it, or discover its nature, its attributes, or its relations: and go great indeed is the effect of attention, that, without it, it is impossible to acquire or retain a distinct notion of any object of thought.

To this purpose it is said, that for Isaac Newton, when he was complimented upon the force of genius which had made such improvements in mathematics and natural philosophy, made this reply, no less judicious than modest: "that, if he had made any improvements in those sciences, it was owing more to patient attention, than to any other talent." As it is very helpful to memory, if not essential to it, that the perception of the idea which we wish to remember should remain in the mind for a certain space of time, and should be contemplated by itself exclusively of every thing else, we can be at no loss to account for the affiance which the memory derives from attention, which confiats partly, if not entirely, in the effort of the mind, to retain the idea or the perception, and to exclude the other objects that solicit its notice. Hence it happens that in solitude, or the fillness of the night, when the attention is undiverted and undistracted by surrounding objects, the impression made by any one object is stronger and deeper: and the memory becomes more retentive. When one faculty of the mind is intensely engaged about any object, the other faculties are laid, as it were, fast asleep; hence a man needs not what is before his eyes, when his mind is occupied about other things. In the tumult of a battle, a man may be shot through the body without knowing any thing of the matter, till he discovers it by the lobs of blood or of strength. The off acute lactation of pain may be deadened if the attention be vigorously directed to another object. The anecdote relating to the attention of Archimedes at the siege of Syracuse is well known. (See Archimedes.) When there is no particular object that draws away our attention, there is a delusion of thought in man, and in some more than in others, which makes it very difficult to give that fixed attention to important objects which reason requires. A habit of attention may be acquired by practice; and the study of the mathematical sciences has a peculiar aptitude to direct and fix it. Attention is one of those operations of the mind, which, according to Dr. Reid's distribution (Essays, p. 78), belong to the class of those that are voluntary.

Attention, in respect of hearing, is the stretching or stretching of the membrana tympani, so as to make it more susceptible of sounds, and better prepared to catch even a feeble agitation of the air. Or it is the adjusting the tension of that membrane to the degree of loudness or loudness of the found to which we are attentive.

"Sounds," says the celebrated Bacon in his Natural History, "are melodyed by the intention of the sense, where the common sense is collected most to the particular sense of hearing, and the sight suffused. Therefore sounds are sweeter, as well as greater, in the night than in the day; and I suppose they are sweeter to blind men than to others; and it is manifest, that between sleeping and waking, when all the senses are blind and suffused; music is far sweeter than when one is fully wakened."

ATTENUANTS, in Medicine. This term is applied to those medicines which are suppos'd to poofess the power of restraining the concreted parts of a fluid to the same rate of fluidity which they pollesed before concretion. It is nearly synonymous with refoleant. A very reasonable doubt has been entertained, whether there is properly any such attenuating power reposing in any medicine, independent either of mere dilution, or else of the stimulant property. The idea, however, of the operation of attenuants is the following:—many of the older physicians, and after them the Boerhaavians, supposed obstruction in the circulating sytem to be produced by the red blood, or a thinner impervious humour joined with it, flagitating in their proper veffels, or wedged into other veffels of a small diameter than
than the fungous by an _error loci_. This, they supposed, would produce a greater motion and heat, owing to the adherence of the saliva, which would incline the humours to a state of perspiration. Of these concretion some are soluble by water alone, such as the salines, fetid, and mucous; but others require the dissolving power of certain medicines; and hence in the former case, _billets_ alone are sufficient to remove the obstruction, but in the latter recours must be had to the _attenuants_. Concretions supposed to be produced by an inflammatory fluidity of the blood, and oily, fetid, and calculus concretions, were considered as yielding to the internal use of various salts, such as fay gum, fumammoniac, and fixed alkali, also loaves, dejections of the acid and alkaline vegetables, and bile (which is a kind of natural loof), all of which were considered as equally attenuating and the reader will hence perceive how closely the experiments of the laboratory were applied in the living animal. Another species of attenuating or resolving remedies was the whole class of mercurial medicines, which are known to produce the most violent flow of saliva and thin fetid humours from the body, the consequence as was imagined of the power pulsed by this mineral to resolve and break down acid matter impacted in the glands and minister vesicles.

The term attenuant is not now much employed in its original sense; the alleged abuse of obstructions being entirely disputed, as well as the supposed solvent power of these medicines upon the concreted humours, whilst remaining in the vessels of the body.

**ATTENUATA** in _Entomology_, a species of _Leptura_ that inhabits Europe, and is both defined and figured by several authors. The wing-cases are attenuated and fleshy, with four black bands; legs toothless.

**Attenuata**, a species of _Boreastis_ that inhabits Rio Janiero. The wing-cases taper towards the end, terminate in two teeth, and are fringed; body brassy-green; beneath coppery. Fabricius.

**Attenuata**, a species of _Vespa_ with a serruous abdomen, and black petiole, with yellow band. This kind inhabits America. Fabricius, _c._ Off. The antennae are serruous, tipped with black; head black, with the lip yellow.

**ATTENUATION**, compounded of _attenua_ and _tenere_, _tenus_, the act of _attenuating_; that is, of making any fluid thinner and less confluent than it was before.

Attenuation is defined more generally by Chaviré, the dividing or separating of the minute parts of any body, which before, by their mutual _nexus_ or impenetrability, formed a more continuous mass. Accordingly, among alchemists, we sometimes find the word used for pulverization, or the act of reducing a body into an impenetrable powder, by grinding, pounding, or the like.

**ATTENUATUS**, in _Entomology_, a species of _Carabus_ (Gynerus attenuatum Fabr. Append.) This insect is yellowish, black, wing-cases rather coppery, with three rows of raised dots; thorax narrow; head very narrow. Panz.

**Attenuatus**, in _Natural History_, a species of _Echimonymchus_, described by Müller. Zool. Dan. It is globular, with an equal smooth yellow body; and neck filiform. Sometimes found in the interstices of the flounder. This is one of the _longicolls_ of Pallus.

**Attenuatus, pedunculus**, in _Botany_, denotes a footstalk that grows smaller towards the flower.

**ATTENY**, in _Geography_, a town of India, in the kingdom of Deccan, beautifullysituate in a forest of palm-trees, not far from the sea, about twenty two leagues north of Shapoor.

---

**ATTERTBURY, Francis**, in _Biography_, a prelate of eminence in the political and literary world, was born, in 1662, at Milton Keynes near Newport-Pagnell, in Buckinghamshire, where his father, Dr. Lewis Attterbury, was rector. Having pulled through a course of grammar learning at Welminister school, he was elected, in 1684, a student of Christ-church college in Oxford. Here he acquired reputation as a classical scholar, and exhibited specimen of his political talents in a Latin version of Mr. Dryden's "Abelard and Aechotophel;" an epigram on "A lady's fan," addressed to Miss Ogborne, who afterwards was his wife; and a translation of "Two Odes of Horace," viz. Od. 9. 1. and Od. 3. 1. iv. These are published in his "Epistolary correspondence." He took his degree of bachelor of arts in 1689, and that of master in 1687, and at this period he first appeared as a controversial writer, by vindicating the reformation, in a piece intituled, "An Answer to severe confederations on the spirit of Martin Luther, and the original of the Reformation." Whilist he continued at college, he is thought to have taken a part in the famous dispute between Mr. Bentley and the Hon. Mr. Charles Boyle (afterwards earl of Orrery), concerning the genuineness of "Phalaris's Epistles," although his name did not appear on the occasion. The time of his taking orders is not precisely ascertained; but it may be inferred from circumstances that it was either at the close of the year 1690, or in the beginning of 1691. He seems to have been tired of a college life, and thinking himself formed, as he expresses himself, for "another scene, and another sort of conversation," he determined, whenever any favourable opportunity occurred, to leave Oxford. Disappointed in his application for the rectory of Milton, which was the place of his birth, he came to London in 1693, and was appointed one of the chaplains in ordinary to King William and Queen Mary, preacher at Bridewell, and lecturer at St. Bride's. His compositions for the pulpit were distinguished by the brevity of sentence and warmth of language, and accordingly they soon commanded attention. One of them, "On the power of clarity to cover obscurity," excited the notice and admiration of Hoadly; and another, intituled "The former incapable of true wisdom," was more acrimoniously censured. In the year 1700 he commenced a controversy with Archbishop Wake, concerning "the rights, powers, and privileges of convocation," which lasted four years, and in the prosecution of which he appeared as an able and ardent advocate for high ecclesiastical authority, and the independence of the church on the state. The learning, ingenuity, and zeal manifested on this occasion, procured from him the thanks of the lower house of convocation, and the degree of doctor in divinity from the university of Oxford. At the commencement of the year 1705, he was installed archdeacon of Toynbee; and in the progress of it he was engaged with some other learned divines, in revising an intended edition of the Greek testament, with Greek scholia, collected chiefly from the fathers, by Mr. Archdeacon Gregory. The accesion of Queen Anne, in 1702, was to him a favourable event; and it was soon followed by his appointment as one of her majesty's chaplains in ordinary; and in 1704, he was advanced to the deanship of Carlisle. In 1706, he preached a funeral sermon on 1 Cor. xv. 19, which occasioned a dispute with Hoadly concerning "the advantages of virtue with regard to the present life." In the following year he was appointed one of the canons residentiary of the cathedral at Exeter; and in 1709, his distinguished talents in the pulpit introduced him into the honourable office of preacher at the Rolls-chapel. In this year he was engaged in a controversy with Hoadly concerning "Pallia obedience;" and in the following
ATT

ing year he assailed Sacheverell in his famous trial, who re-

commended him by a legacy of 500l., and in performing the

office of prosecutor to the lower house of conversation. In

1711 he was appointed by the conversation one of the com-

mittee for comparing Mr. Whiston's doctrines with those of

the church of England; and he was principally concerned in

drawing up "A representation of the present state of

religion," which, though too exceptionable in its principles,

and too virulent in its spirit to be presented to the queen,

was nevertheless printed and privately dispersed. In 1712,

Dr. Atterbury was made dean of Christ-church; and in

1713 he attacked, by the recommendation of the earl of

Oxford, the height of his promotion, that of the bishopric

of Rocheller, and deanery of Wembly. It is said, that

he aspired to the primacy; but the death of the queen, in

1714, disconcerted all his projects, and disappointed all his

hopes of higher advancement. The accession of George I.

was an event which he had reason to deplore. The

personal dislike of the king, of which he had mortifying evi-
dence, was retaliated on his part by disaffection to the estab-
lished government. In the first year of this reign, during

the rebellion in Scotland, he, and one other bishop at his in-
ligation refused to sign the "Declaration" of the king; and

his name occurs in the most violent protests against the

measures of government. Not content with a constitutional

opposition, he engaged in a correspondence with the pre-
tender's party, in order to bring about a revolution in favour

of the abdicated family; and in August 1722, he was ap-
prehended on this account, and committed to the Tower.

Whilst he was under examination, previous to his commit-

tment, he is said to have adopted our Saviour's answer to

the Jewish council; "If I tell you, you will not believe me;

and if I also ask you, you will not answer me, nor let

me go." In the month of March of the following year, a

bill was brought into the house of commons for "inflicting

certain pains and penalties on Francis bishop of Rocheller;

"and having passed the commons, it was sent up to the lords

for their concurrence. In this house it was strongly op-
posed, and the bishop, in his defence, made an able and

eloquent speech, closing, after a solemn profession of his

innocency, an appeal to the searcher of hearts, with this

memorable declaration: "If your lordships shall pro-
ceed to pass this bill against me, I shall disprove myself

quietly, and tacitly submit to what you do; God's will be
done; naked came I out of my mother's womb, and naked shall

I return; and whether be

s

I

be the

name

of the Lord!" At length, however, after a long and

very warm debate, the bill passed into a law, and the bishop

was condemned to the deprivation of all his offices and

benefices, and to perpetual exile. The justice of this

sentence, though much mitigated at and immediately after

the time when it was passed, has been since generally al-

lowed. Of his attachment to the pretender, the following

striking instance is related by the author of the Memoirs

of Lord Chesterfield, from Dr. Birch's MS. papers. "Lord

Harcourt leaving the old ministry, provoked Atterbury's

abusive tongue. He, in return, declared, that, on the

queen's death, the bishop came to him and to lord Boling-

brooke, and said, nothing remained but immediately to pro-

claim king James. He further offered if they would give

him a guard, to put on his lawn sleeves, and head the pro-

cession." Of his disaffection to the existing government,

many convincing evidences occur; and particularly his con-
duct towards Mr. Gibbin, a worthy clergyman, and curate

of Gravesend, whom he suspended for a loving the title of

his church to the chaplain of the Dutch troops, who were

called over in 1715 to suppress the rebellion. Atterbury,

in consequence of his sentence, left the country in June,

1723, accompanied by his daughter, Mrs. Morrice, to whom

he was affectionately attached, and landed at Calais. From

thence he went to Brussels; but being obliged to leave that

place, he removed to Paris, where he resided till his death,

forsaking the rigours of exile by study, and conversation

and correspondence with learned men. It appears, how-

ever, he wrote letters published at Edinburgh in 1728, of

unquestionable authenticity, that he was actively engaged

in 1725, in forestalling discontents in the highlands of Scot-

land, with a view of encouraging another rebellion. In

1729 he lost his daughter, and this afflictive event, which

he bore with resignation, is nevertheless thought to have

hastened his own dissolution, which happened at Paris, in

February 1731. His remains were brought over to Eng-

land, and privately interred in Westminster-Abbey. We

cannot forbear inferring, in this place, Mr. Pope's fine

epithet on the bishop, written in the form of a dialogue

between his daughter, supposing he expiring in her arms,

immediately after her arrival in France to see him, and him-

1746. As to the justice of the complaint, which it pays
to his political sentiments, the reader must judge.

Dialogue.

She. "Yes, we have lived,—one pang, and then we part!—

May heaven, dear father! now have all thy heart. Yet, ah! how much we loved, remember still,

Till you are dutt like me.—"

He. "Dear shade! I will:

Then mix this dutt with thine,—O spotless ghost!

O more than fortune, friends, or country lost!

Is there on earth, one care, one with beside?

Yes, SAVV my COUNTRY, HEAV'n, he said, and

died."

Bishop Atterbury had four children, two sons and two

daugthers. His son Ossian alone survived him.

Some time before his death the bishop published a vindica-

tion of himself, bishop Smolridge, and dr. Aldrich, from

a charge brought against them by Mr. Oldmixon, of having

altered and interpolated the copy of lord Clarendon's, "Hi-

of the Rebellion." His sermons are extant in four volumes 8vo.; those contained in the two first were published by

himself, and dedicated to his great patron, sir Jonathan

Trelawney, bishop of Winchelsea; those in the two last were published after his death by dr. Thomas Moore, his

lordship's chaplain. His epistolary correspondence with

Mr. Pope is extant in the collection of that poet's "Let-
ters." Mr. Nichols has lately published in three volumes,

8vo. "The Epistolary Correspondence, Visitation, Charges,

Speeches, and Miscellanea of the right reverend Francis

Atterbury, D.D. lord bishop of Rocheller," with historical

notes; the greater part of these volumes is entirely new.

From the General Dictionary (vol. ii. 445.) we learn, that

Dr. Atterbury is said to have translated "Virgil's Georgics"

in English; and to have written an " Harmonia Evangelica."

In an elegant dissertation on the fictitious person of Japyx,

or Japis in the Æneid, he attempted to prove that Virgil

meant by this person to allude to Antoninus Mufa, an emi-

nent physician and polite scholar at Rome, in the reign of

Augustus; but the attempt does no honour to his critical

erudition, and has been deemed futile by judicious com-

mentators. His translations of two odes of Horace, are re-

puted by a competent judge to have received more than their
due share of applause.

As to this prelate's character, however the moral and poli-

tical part of it may have been differently appreciated by

opposite
opposite parties, it is universally agreed, that he was a man of great learning and uncommon abilities; a fine writer, and a most excellent preacher. With respect to Atterbury's public and political character, he was marked with that turbulent ambition and contentious violence which animated the Becketts and Lands of former times, and which was ill defended by the affected mildness and moderation of his epistolary writings. "The turbulent and imperious temper of this haughty prelate," says Dr. Wharton (Eliay on the Writings and Genius of Pope, vol. ii. p. 432, 433.), "was long felt and remembered in the college over which he presided. It was with difficulty queen Anne was persuaded to make him a bishop; which she did at last on the repeated importunities of lord Harcourt. After her decease, Atterbury occasionally urged his friends to proclaim the Pretender; and, on their refusal, upbraided them with their timidity, with many oaths; for he was accustomed to swear on any strong provocation. From an anecdote related by lord Chesterfield to Dr. Maty, and recorded in "Mary's Memoirs" of that nobleman (p. 279.), it has been inferred, that Dr. Atterbury had been long known among his friends, to be a sceptic, or an unbeliever, with regard to revelation. The anecdote is as follows. "I went to Mr. Pope one morning at Twickenham, and found a large folio bible with gilt clasps lying before him upon his table; and, as I knew his way of thinking upon that book, I asked him jeocelty, if he was going to write an answer to it? It is a preface, said he, or rather a legacy, from my old friend the bishop of Rochester. I went to take my leave of him yesterday in the Tower, where I saw this bible upon his table. After the first compliments, the bishop said to me, my friend Pope, considering your infirmities, and my age and exile, it is not likely that we should ever meet again, and therefore I give you this legacy to remember me by it.—Does your lordship abide by it yourself?—I do. If you do my lord, it is but lately. May I beg to know, what new light or arguments have prevailed with you now, to entertain an opinion so contrary to that which you entertained of that book all the former part of your life?—The bishop replied, we have not time to talk of these things; but take home the book; I will abide by it; and I recommend to you to do so too, and so God bless you!" This single flimsy, however, not only uncorroborated, but contradicted by other facts, is not sufficient to warrant the charge of scepticism against this prelate. Whatever were his faults, he does not appear to have disbelieved or even doubted the truth of Christianity. His actions and writings exhibit the fiery zealot and bigot rather than the infidel; though it must be acknowledged, that these characters may be united in the same person. His sermons on the miraculous propagation of the gospel, and on a standing revelation, being the butt means of conviction, besides other discourses, furnish important and pleasing evidences of his attachment to the Christian religion. It cannot also be considered strange, that he generally treats unbelievers with contempt, as an ignorant, superficial, and conceited set of men; which he would scarcely have done if he had been of the same sentiments. For though a man may conceal, or deny, or even pervert the opinions which he himself holds, it is not very likely that he should appear to despise the retainers of them. Besides, there is an arduous of affectionate censure in Mr. Pope's two last letters to Dr. Atterbury (Pope's Works, vol. v. p. 351—355.), written to him when he was in the Tower, which that eminent poet, who valued himself upon his moral character, could not well have expressed to the bishop, if he had known that he had acted the base and hypocritical part of publicly professing and defending that religion which he privately disapproved. Not to add, that he actually derived much of his connection in adversity from his religious principles. His correspondence with Dr. Wall and bishop Potter, preserved in Nicholas's publication, fully proves his belief in, and his zeal for, the honour of the Christian revelation; and the testimony, derived from his private correspondence and from the uniform tenor of his life and writings, might, surely, with impartial and candid judges, to outweigh the evidence deduced from a single flour, however well authenticated. In his letters to Mr. Pope, and to his other correspondents, bishop Atterbury appears in a very pleasing light, both as a writer and a man. In safe and elegance, these letters are superior to those of Mr. Pope, which are more fluently. If we were to form our judgment of him, as a man, from these letters, we should incline to think that it was his life with to spend his life in a learned and elegant focal intercourse with a few private friends; and yet numerous facts sufficiently show, that nothing could be more distant from his real disposition and character, and that he was actuated in early life, and in the progress of his year, by a restless and turbulent ambition. His panegyrist, bishop Smalridge, in the speech which he made, upon presenting him to the upper house of convocation, as Proctor, represents him as "Vir in nullo literarum generis holpes, in pleniquo artibus et flavis diu et feliciter exercitus, in maxime perfectis literarum disciplinis perfectissimus: i.e. "one, who is well acquainted with all parts of literature, long and successfully exercised in most arts and studies, and most accomplished in the four sciences which admit of the greatest perfection." Although it is allowed, that he was sometimes too severe upon his adversary, and dealt rather too much in satire and invective, yet this is imputed by his panegyrist more to the natural fervour of his wit, than to any bitterness of temper, or prepossession. As a composer of sermons and a preacher, he excelled his co-temporaries, and in this respect few English authors have attained to so high a rank. Of his character, as a preacher, the following encomium is bestowed upon him by the author of the "Tatler" (N. 66) who, having observed that the English clergy too much neglect the art of speaking, makes a particular exception with regard to this prelate. "Atterbury," says he, "has so particular a regard to his congregation, that he commits to his memory what he has to say to them; and has so soft and graceful a behaviour, that it must attract your attention. His oration, it is to be confessed, is no small recommendation, but he is to be highly commended for not losing that advantage, and adding to the propriety of speech (which might put the criticism of Log gia), an action, which would have been approved by Demosthenes. He has a peculiar force in his way, and has many of his amicities, who could not be intelligent hearers of his discourses, were there not explanation as well as grace in his action. This voice of his is used with the most exact and honest-skil. He never attempts your passions, till he has convinced your reason. All the objections, which you can to him, are laid open and disordered, before he usus the least vehemence in his sermons; but when he thinks he has your head, he very soon wins your heart, and never pretends to steal the beauty of holies, till he has convinced you of the truth of it." Dr. Blair (Lectures on Rhetoric, &c. vol. ii. p. 127-155.), says of this prelate, that he is deservedly accounted one of our most eloquent writers of sermons. "At the same time," he adds, "he is more distinguished for elegance and purity of expression, than for profundity of thought: his style, though sometimes careless, is, upon the whole, neat and chaste; and more beautiful than that of most writers of famous.
fermons. In his sentiments, he is not only rational, but pious and devotional, which is a great excellency." Dr. Walton (ubi supra, p. 435.), thinks, that Atterbury was, on the whole, rather a man of ability, than a genius; and that he writes more with elegance and correctness, than with any force of thinking or reasoning. Biog. Brit. Gen. Dis.

Atterbury, Lewis, the elder brother of the bishop, was born at Caldecott, in the parish of Newport-Pagnell in 1656, and after finishing his grammatical education under Dr. Bushby at Westminster school, removed to Christ church college, Oxford, in 1674. In 1695, he was elected preacher to the chapel at Highgate, in the neighbourhood of London; and in 1707, he was presented by the queen to the rectory of Shepperton, in Middlesex. In 1719, he was collated to the rectory of Hornsey, in Middlesex, in which parish the chapel of Highgate is situated. Upon application to his brother for the archdeaconry of Rochester, he was refused; probably more from a mean opinion of his talents, than from delicacy. However, he sustained the character of an useful parish priest, annexing the profession of physic, which he studied for the benefit of his poor parishioners, to the clerical character; and he acquired the reputation of a plain, solid, useful preacher. At the age of seventy he had a stroke of the palsy, and died at Bath the next year. He published several sermons, which formed two volumes, and other pieces; and since his death, two volumes of his sermons have been published, in consequence of his sedimentary directions, by Mr. E. Yardley, archdeacon of Cardigan. Dr. Atterbury was intimately acquainted with archbishop Tillotson, formed his style of preaching on his model, and published a defence of him against the attack of an Irish priest. Biog. Brit.

Atterklaa, in Geography, a town of Germany, in the archduchy of Austria, six miles north-west of Künzendorf.

Atterming, in our Old Writers, is used for a time or term granted for payment of debt, according to Blount.

Attern, in Geography, a town of Hindooistan, in the country of Agra, thirty-eight miles S.S.E. of Agra, and thirty-nine north-east of Guzur.

Attestation, compounded of a, to, and phae, witness, the giving testimony or evidence of the truth of any thing; especially in writing.

Attestation of Deeds, See Deed.

Attestation of Devices. See Device.

Atthis, in Ornithology, a species of Gracula, called by Hufialquift curvus Aegyptius; and by Latham, the Egyptian grackle. The colour of this bird is greenish; belly ferrerugious; legs fanguineous. Gmelin. It inhabits Egypt, as the synonymous names imply; and is believed to live on centipedes, scorpions, and other insects, the remains of such having been found in the stomach.

It is abt. the size of a duck; bill dull black, reddish at the base, eye blood, head rather flattened at the top; upper parts of the plumage deep green, spotted with blue-green on the crown, hinder part of the neck, and the shoulders; neck and back of the same deep green, but not spotted. On each side of the neck and back is a longitudinal broad line, the fore-part of which is ferrerugious, the rest of a whitish lucid blue; throat white; tail nearly even at the end, a d of a deep blue colour; claws blackish. Lath. Gen. Syn.

Among the ancients, the name of thisis was given to some bird at present not very accurately known. By Aldrovandus, and other naturalists, the same name has been also aligned to birds altogether different from the present species.

Attia, in Geography, a town of Persia, ten leagues south of Kish.

Attic, something relating to Attica, or the city of Athens. In matters of Philology, we use, Attic falt, falar Attic, meaning a delicate, poignent kind of wit and humour, peculiar to the Athenian writers. Attic wit, was a witnesse incapable of corruption; so an Attic Muse was an excellent one, &c.

Attic Dial-lett, in Grammar, one of the four Grecian dials, which was used in Athens and the adjoining country. Those who have chiefly distinguished themselves in this dial-lett, are Thucydides, Aristophanes, Plato, Iocrates, Xenophon, and Demosthenes. Its general properties are, that it affects contractions of syllables in the same word, and also the joining of words; it often changes ζ into ζ, ζ, as ζισιν: for ειπεις, οτιν, ζανον, to ζανον, to confide, and ζανον, for ζανον, to do: it calls away: αι and ηι, ας and ξινα, to ηπεις, and καις for καις, most; it changes ζ into ζι, as ρείς for ριν, a temple; it joins δι to the end of words, giving it a circumflex accent, as ειπεις, ειπεις, and it annexes to the end of adverbs, as αι, ηι. Besides, there is no instance of an Attic among the existing antiquities of Athens. In Italy it is met with in the triumphal arches, and in the forum of Nerva.

It has been much employed by the moderns, and particularly by the Italian architects. But the rules which they give for its proportions are various, some making it in height equal to one half, and others to one third of the principal order. It is usually decorated with pilasters, and frequently with balfo-relieves, in the spaces between; or there are windows in these spaces. The pilasters are sometimes plain, and sometimes have a fank pannel, or other ornaments. They have no diminution, nor have they any peculiar base or capital, the mouldings at the top and bottom of the Attic continuing round the pilasters. In the arch of Constantine at Rome there are statues placed over the columns of the principal order, immediately before the pilasters of the Attic; and this has frequently been imitated in modern buildings.

Attic Story is also frequently applied to the upper story of a house, constructed in a roof, when there is no order of architecture employed in its decoration.

Attic Order. This term has been by some authors used to denote the pilasters that are employed to decorate an Attic story. Pliny, after enumerating the other orders, says, "Perter his form very; vocantur Attic coloniae quattuor angulos pari laterum intervallum." But how these square columns were formed is very uncertain, since we have no remains of columns which are known to have been of the kind here described; and Vitruvius makes no mention of them. The Attic of the forum of Nerva corresponds most with Pliny's description, there being projections that come forward from the attic over the detached columns, faced with square pilasters, whose sides are nearly equal in width to their fronts. It seems improper, however, to call this an order of architecture, as it has no peculiar parts essentially
Attic or Atticuric Bases, Vitruvius, lib. iv, cap. 3, saying of the bases of columns, says, "This done, the bases are fixed in their places, and are so proportioned that, including their plinth, they have in height half the thickness of the column; and in projection, which the Greeks call ἔνσωσις, they should have one quarter of the thickness of the column; so that their breadth and length will be one and a half the thickness of the column. Their height, if they are to be in the Attic mode, is so divided, that the upper part is one third of the thickness of the column, and the remainder is left for the plinth. The plinth being excluded, the remaining part is divided into four parts, and the upper torus has one of them; the remaining three parts are equally halfed, and one half makes the lower torus, and the other the fust, which the Greeks call νυσσός, with its squares."

This kind of base is frequently found in the ancient examples of the Ionic and Corinthian orders, both Greek and Roman, but the proportion of its parts varies in almost every different example. We sometimes also meet with triflary columns between the torus and fillets, and all its moldings are in Roman architecture, frequently covered with ornaments. This base is extremely beautiful, and has been much employed by modern architects, who have, though very improperly, applied it also to the Doric order, or rather to the order which has long been called Doric by the moderns. See Doric Order.

For an example of the Attic base we refer the reader to Plate XVI. of Architecture.

Attic or Atticuric Door. Vitruvius, lib. iv, cap. 6, says, in speaking of doors, that "they are of three kinds, Doric, Ionic, and Attic." And he afterwards proceeds to describe the manner of forming the Attic door, connecting with this remarkable passage, "These rules, which are practiced in the composition of Doric, Ionic, and Corinthian temples, I have explained as well as I have been able, according to the approved methods;" intimating then by that, he has applied the term Attic only as relating to the Corinthian order.

Attic Year. See Year.

ATTICA, in Ancient Geography, one of the eight districts into which Achaia was divided, argyently called Αττης, Αττική, and Ατη. Plin. i. iv. 7. Paufan. in Attic, c. 11. Mel. l. ii. c. 3. This country is a kind of peninsula of a triangular form, bounded on the north by Bectia and the gulph of Enipus, on the west by Megaris, on the south by the Saronic gulf; and on the exit by part of the Εγερέας; and extending from north-west to south-east about eighty in les with decreasing breadth, but at an average about fifty miles, so that its area is considerably less than that of Yorkshire. This little country, every where intersected with rocks and mountains, is by nature extremely barren. The fertility of the soil requiring arduous industry to produce the common necessaries of life, rendered the territory much less inviting to plundering or conquering invaders than the fruitful lands in other parts of Greece. Hence Thucydides observes, in his Introduction to his History, that a much greater portion of its inhabitants was aboriginal than those of neighbouring divisions. The physical deficiencies of Attica tended to invigorate the intellectual and moral energies of the people; and a political establishment happily adapted to the circumstances and characters of the citizens, enriched and improved the genius and spirit from which it sprang. A region less extensive and naturally productive than North Wales, was transcendent in the arts of war and of peace, and repelled the chosen myrads of the most potent monarch. Insitired by freedom, this little body made the gigantic effort of the Falk, tremble on his throne, and left monuments of military achievements, springing from liberty and patriotism, and guided by wisdom, which have only been surpassed by the tranquil and peaceful efforts of its genius in the various departments of the arts, literature and philosophy.

Though in the early periods of their history, they were little subject to foreign invasions that fought to dispossess them of their habitations, their maritime exposure opened the way to emigrations of sea-faring adventurers who fought establishments, not by exterminating and enflaming the natives, but by conciliating them through an interchange of benefits. The first navigators recorded in history to have visited the Autochthonous, or aboriginal poecillophoros of Attica, came from the mother country of creation and science. Cecrops, an Egyptian (B. C. 1530), laid a colony of his countrymen into Greece. (See Strabo, lib. iix.) The colony of Cercopes derived its origin from the city of Sais, in Egypt. The adventurers who composed it had quitte the banks of the Nile, to withdraw themselves from the tyranny of an inexorable conqueror; and after a tedious voyage, reached the shores of Attica, at all times inhabited by a people whom the fierce nations of Greece had disdained to bring under the yoke. Their fertile fields offered no plunder, nor could their weaknefes inspire any dread. Habituited to the enjoyments of peace, free without knowing the value of independence, rude rather than barbarous, they must have united themselves without difficulty to strangers instructed by misfortune. In a short time, the Egyptians and the inhabitants of Attica, formed but one people; the former, however, alluding over the latter that ascendency which sooner or later invariably attends superiority of knowledge; and Cecrops, placed at the head of the united people, conceived the noble design of beflowing happiness on his adopted country.

The ancient popes of these lands yearly gave a regular succession of the wild fruits of the oak, and relied on nature for a reproduction which secured their annual subsistence. Cecrops first engaged the wandering hunters or shepherds of Attica to unite in villages of husbandmen. Cere, wine, and oil, rewarded their useful labours; and these productions, being acquired by common toil, were regarded, with the ground itself, as a common property. The idea of an exclusive and permanent right to all the uses of a piece of land, whether belonging to communities or to individuals, is one of the most interesting legs in the progress of society. In Attica, this invaluable right was immediately followed by such institutions as tended to secure its enjoyment, and to check the injustice of man, who is seldom willing to acquire by fair labour what he can ravish by sudden violence. The salutary influence of religion was employed on this important occasion. With agricultural property religious rites were introduced, and Cecrops instituted sacrifices to the attributes of wisdom and of power under the names and sensible representations of Minerva and Jupiter. He is also by some historians said to have taught his subjects the art of navigation; to have instituted the aereopagus, and to the initiation of civil rights to have added the punishment of crimes. Aware of the advantages which might be derived from union of effort, Cecrops proposed to facilitate it by contiguity of residence; he induced his subjects to collect and secure themselves within a wall, and laid the foundation of Athens. He placed this new city on a hill in the middle of a large plain, and built the citadel on the rock in which the hill terminated; this prince reigned fifty years. For an abstract of the history of this country, and other particulars relating to it, see Athenians, and Athens.
ATT

The chief city of Attica, next to Athens, was Eleusis. Rhamnus was famous for the temple of Amphiaras and the statue of Nemesis. The principal river was Asopus; as to the Hymus, Eridanus, and Cephalis, they were rather brooks than rivers; but Attica, having a number of havens, was left in want of rivers. The tribes of this kingdom, according to Thucydides (i.ii.) occasioned by its frugality and commerce, are said to have amounted to 1200 Attic talents a year; hence it was enabled to maintain a powerful army and navy, and thus to extend its possessions.

The coin of Attica was commonly flanked with the figure of an ox, and this circumstance gave occasion to the phrase frequent among the Greeks, of a thing being worth 10 or 100 oxen; and hence also arose the common proverb "havem habet in lingua," when a man was thought bribed to speak contrary to his own sentiments. But the wealth, strength, and population of Attica, were principally displayed in the number of tribes, amounting to thirteen, into which it was divided, and the great number of cities and towns belonging to each tribe.

ATTICUS, Heroes Thieres Claudius, in Biography, was defended of a noble family, which traced their pedigree as high as Cimon and Miltiades, and born at Marathon in the territory of Athens. His father, Julius Atticus, was reduced to a low condition by the proclivity of his father; but by the accidental discovery of a treasure in his house, he was unexpectedly raised to the position of affluence. Dreading the event of this discovery he communicated it to the emperor Nerva, who empowered him to use it at his pleasure; and on a second representation, that it was too large for a private person, the emperor renewed his licence, adding that if it was too large for use, he might abuse it, if he pleased, for it was his own. Atticus having increased his wealth by marriage, lived at Athens with very singular magnificence, giving to the people frequent largesses, and offering to the gods very splendid sacrifices. Whilst he had the command of the free cities in Asia, in the time of Adrian, he perceived that the city of Troas wanted water, and he obtained of this emperor a grant of three millions of drachmas, in order to defray the expense of procuring the necessary supply; but the charge of executing his project for this purpose amounted to seven millions of drachmas instead of three, and the additional expense he defrayed out of his own fortune. The great wealth of Atticus enabled him to make very liberal provision for the education of his sons, Herodes; and accordingly he employed Scopelian, one of the most eminent orators of the age, as his instructor, and rewarded him liberally for his services. Herodes polished disingrafted talents, which he cultivated with diligence; and his attention was principally directed to the study of rhetoric. In this science, as it was then practised, he made great proficiency; and such were the ardour of his pursuit, and his ambition of gaining applause, that when he was deputed at an early age to address a speech to the emperor Adrian, who was then in Pannonia, the young orator is said to have failed in the attempt, and to have been almost urged by shame and despair to throw himself into the Danube. The misfortune, however, served only as an incitement to future diligence. Having finished his attendance in the schools of rhetoric, Herodes returned to his own country, and delivered public lectures, which were popular and much frequented by the sophists, philosophers, and rhetoricians of the age, who were munificently rewarded for their attendance and applause. The liberality of Herodes was, however, somewhat imposed upon and abused. Attius Gallius, who was himself a disciple of Herodes, mentions one instance to this purpose. A man with a cloak, long hair, and the beard down to his waist, presented himself to the orator, and supplicated him. Being interrogated who he was, the pretended philosopher indignantly replied, that he was a philosopher, and expressed surprise at the question. "I see," replied Herodes, "the cloak and the beard, but I do not see the philosopher." One of the company interpoded, and observed, that this person was an impudent beggar, who spent his time in the tavern, and inflicted those who refused to relieve him. "Well then," said Herodes, "let us give us mens, though not as to a man;" taunting him with Jon taquem hurum.

The fame of Herodes having extended through Greece, and even to Rome, he was appointed by the emperor Titus Antoninus the preceptor of eloquence to his two sons Marcus Aurelius and Lucius Verus; and being there introduced into the way of promotion, he was created consul in the year 143. About this time he was appointed prefect of the free cities of Attica, and to regulate and conduct the Panathenian games, at which he was crowned. On this occasion he erected the stadium, 600 feet in length, and formed of white marble, a most sumptuous work, of which some remains are still visible. He also constructed a magnificent theatre at Athens, called Regillum, in honour of his wife Regilla; he also repaired and beautified the oecum of Perges; and decorated many other places in Greece and Asia with useful and ornamental works. He likewise confectioned rich offerings in the temples at Athens, Delphos, Olympia, Pisa, and other places. To this liberal and even profuse expenditure of his wealth it is owing, that his name has not sunk into oblivion; as the productions of his eloquence, some of which excelled in the time of Philoctatus and Suidas, have been all lost. Notwithstanding these displays of his public spirit, and the benefits he bestowed on his country, his influence excited jealousy; and two brothers, named Quintullia, who commanded in Greece, feized occasion for transmitting complaints against him to the emperor Aemus. Herodes presented himself before the emperor, but instead of employing his eloquence for the purpose of conciliation, he rudely reproached him with a predetermination to ruin him. An officer, who fled by, exclaimed, that this insolence merited death. "A man of my age," said Herodes, "does not fear death." The mild emperor contented himself with punishing the freedmen of Herodes; who himself retired to Attica; and attempting by a letter to Aurelius to regain his kindness, the emperor returned a friendly answer. Herodes was again mortified by a charge of having been accursified to the death of his wife, preferred against him before the senate by his brother, who had been confined; but he was acquitted. In token of his sorrow for her loss, he erected to her memory a statue, bearing an inscription, still legible. The corpse of his life was spent at Marathon, where he died at the age of 76; and his countrymen honoured him with a public funeral at Athens. Guery's Hist. Emp. vol. vii. p. 230, &c. Mem. de l'Acad. des Inscript. vol. xxx. Gen. Biog.

ATTICUS, Titus Pomponius, a Roman knight, lived in the latter period of the Roman republic, and acquired great celebrity from the splendour of his private character. He inherited from his father, and from his uncle Q. Cicilius, who adopted him, great wealth; and availed himself of his liberal education to such a degree, that he was exhibited as a pattern to his schoolfellows, among whom were the younger Marcus and Cicero. When he attained maturity, the republic was disturbed by the factions of Cinna
and Sylla; but endowed with a peculiar finery of manners, which made him uniformly averse from civil contentious, he retired to Athens with a great part of his property, and there devoted himself to study, and particularly to Grecian literature, in which he excelled his contemporaries of his own country. At Athens he became popular by his conciliatory disposition and conduct, by the liberal distribution of his money, and by his charity to the poor and difreased. The Athenians wished to confer on him the honour of a citizen, which he declined; and though during his abode with them, he would not suffer them to erect statues to him, they twified their respect in this way immediately on his departure, an event which occasioned a general mourning through the city. The surname of Atticus, which he acquired from his attachment to this city, and his familiarity with its language and manners, became his usual appellation during his life, and continued to distinguish him in after ages. At a distance from the scene of political contention, he interred himself in the welfare of his friends; and at the risk of displeasing the triumphant party, he served a friend in difficulties, for he allotted young Marius, when declared a public enemy, by supplying him with money to escape from his enemies. He even occasionally made journeys to Rome to support his friends in contested elections, and embraced every opportunity that occurred of serving those who needed his assistance. To Cicero he was particularly attached, partly from affinity, as his father Pomponia was married to Quintus Cicero, but chiefly from similarity of disposi- tion; and he supplied him with money in the time of his exile; and also intimate with Hortensius, the rhetorical rival of Cicero, he exerted himself in preserving a good understanding between them. When Rome was in a tranquil state, it was the place in which Atticus chose to reside; but he never engaged in public business. He availed himself of none of the opportunities that occurred of increasing his fortune; whilst he was honoured with a nomination to public offices, he disdained the emoluments accruing from them. He never engaged in a law-suit, nor was ever concerned in an accusation as the principal, or second. He never bid for estates at public auctions, or in any way partook of the spoils of the unfortunate. When the war broke out between Caesar and Pompey, Atticus was sixty years old; and his age was a plea of which he availed himself for not taking part with either; and by his subsequent conduct he offended neither the one nor the other. After the death of Caesar, whose favour he had conciliated, he successfully opposed the establishment of a private treasure for the use of the party which had taken him off, though he was upon very intimate terms with Brutus. Nevertheless, when Brutus and Cassius were obliged to leave Italy, he supplied Brutus with a large sum of money. He afterwards exerted himself to the utmost of his power in favour of Antony and his family. Upon the return of Antony from his retreat, and when every friend of the republican party was exposed to great danger, Atticus withdrew into a place of refuge; and though Antony was urged to destroy him, he remembered his obligations to his benefactor, afforded him by a letter written with his own hand of his safety, and appointed a guard for his protection. In this season of dif- tresses, Atticus succoured the fallen party, and supplied the necessaries of those who, under proscription, had fled to Epirus, out of his own estates; and he showed no lefs respect to Servilia the mother of Brutus, after the death of this patriot, than he had done during his prosperity. His family afterwards became allied to the imperial family by the marriage of his daughter with M. Agrippa, the friend and favourite of Otho, who formed with Atticus an intimate acquaintance, and communicated to him all his movements and designs. While Antony lived, an intimate correspondence was carried on between him and Atticus. Thus from the fall to the fall, he maintained the character of "the general friend of all parties, in all fortunes." The conduct by which this character was acquired and maintained, has not escaped censure; and Atticus has been charged with a neutrality and indifferency, with regard to public concerns, which was dishonourable and criminal. To his Epicurean principles, which he imbibed at Athens under Phaedrus and Zenon the Sidonians, some have ascribed the peculiarities of his temper, and the resolution by which he seems to have been actuated, that amidst the fluctuation and vicissitudes of political events he would maintain a com- posed and tranquil mind. But others have attributed his discriminating character to natural disposition and early habits, more than to any speculative principles. In domestic life, as well as in the more extended circle of social intercourse, he possessed a degree of self-command, which, all circumstances considered, appears to have been very extraordinary and singular. The temper of his uncle Cassius was intolerably peremptory, and yet Atticus humoured it in such a manner that he retained his favour to the last, and inherited the greatest part of his very large fortune. With his mother, who died at the age of 95, when he was 67 years old, and with his sister, who was nearly of the same age with himself, he lived with a harmony so uninterrupted, that he never had occasion to be reconciled to the former, nor ever had any quarrel with the latter. By his own propriety and his uncle's magnificence, he was master of a large fortune, which he expended with liberality. His mode of living corresponded to his influence, and to his taste and habits, as a man of literature and philosophy. His domestics were fickle, but not numerous; several of them had been born and brought up in his own family; and many of them were in one way or other, as readers or copyists, employed to the purposes of literature. His table was elegant, but not costly. Reading was always an accomplishment of the supper; and he had no guests to whom such an entertainment was not acceptable. In his enjoyments he was moderate; in his studies, which formed a great part of his occupation, he was particularly attached to inquiries relative to the antiquities of his country; its laws, treaties, customs, and the genealogies of its illustrious families. On these subjects he wrote several treaties, which were held in high estimation. His poetical talents were employed in concise descriptions of the characters and actions of illustrious men, which were placed under their histories. He wrote in Greek a history of the confinulate of his friend Cicero. Of the writings of Atticus, none remain; but we have a large number of the letters of Cicero, addressed to him, and written from the year of his consulship almost to the time of his death. These letters are confidential, and contain a variety of curious particulars; both political and literary. Atticus having attained to the age of 77, with little interruption of health, was feized with a disorder of the intestines, which terminated in a painful and incurable ulcer. Apprized of the danger of his case, he communicated to his son-in-law Agrippa, and other friends, his resolution of putting a period to a life that was no longer valuable to himself and others. Unmoved by their remonstrances, he determined to abstain from food; and though his terror left him and his pain abated, after an abstinence of two days, he perished in his purpose, and on the fifth day, death closed the scene, in the year of Rom. 21, B. C. 33. Corn. Noct. 3, Dict. Attici. Gen. Dict. Corn. Blog.

Atticus, a Platonic philosopher, lived under the emperor M. Aurelius, and took pains in ascertaining the precise difference
once between the doctrines of Plato and those of Aristotle. Eusebius has preferred several fragments of his works, in which he argues against Aristotle, concerning the ultimate end of man; providence, the origin of things, the immortality of the soul, and other topics. Plutarch, of the Eclectic school, held the writings of Atticus in high estimation, and recommended them as very useful for obtaining an accurate knowledge of the Platonic system. Atticus pronounced it impossible for those who had imbibed the Peripatetic notions, to elevate their minds to a capacity of understanding a relishing the sublime conceptions of Plato. Euseb. Chron. sub. Aurel. A. 175. Prep. I. xv. c. 4 &c. Fab. Bib. Grec. v. ii. p. 54.

Atticus, a patriarch of Constantinople in the fifth century, was a native of Sebastia in Armenia, and having received his education among the Macedonian monks, became first presbyter, and afterwards, v.r.s. in 426, patriarch of the church of Constantinople. But having seized this see while John Chrysofom of Attic was living, he was excommunicated by pope Innocent I. and the western bishops. However, on the death of Chrysodom he was again reëlected, on condition of relinquishing his name in the diptychs, or list of the archbishops of Constantinople, whose names were recited at the altar, as having died in the communion of the church. Atticus is extolled for his learning, prudence, and piety; for the gentleness of his temper and manners; for his zeal against the Nestorians; and for his charity to the poor, without discrimination of religious party and profession. He died in the year 437. While he was presbyter, he committed his sermons to memory; but when he became a bishop he preached extempore. Of his writings there are extant "A Letter to Cyril of Alexandria," on the restoration of the name of Chrysodam in the diptychs, apud Niceph. Hist. Eccl. I. xiv. c. 26. 1 ; "A Letter to Callinicus, presbyter of the church at Nice," accompanying 500 crowns lent to the poor of that city (Socrat. I. vii. c. 25. 1 ; and another in Niceph. hist. supra addressed to the deputies of the church of Alexandria, concerning the means of reëstablishing peace to the church. He also wrote a book, "On Faith and Virginity," dedicated to the daughters of Augustus, and cited by Cyril in his book to the emperors. Socrat. H. E. I. vii. c. 27. Sozom. H. E. I. viii. c. 27. Cave, H. L. vol. i. p. 54.

Attidium, or Attigio, in Ancient Geography, a city of Umbria, situated between Sentinum, Camerium, and Matelica, near the source of the river Aesis. Pliny calls the inhabitants Attidatiata. Several ancient inscriptions have been found in the vicinity of Attigio.

Attigny, in Geography, a town of France, and seat of a tribunal, in the department of Ardenne, and chief place of a canton is the district of Vouziers; two leagues northwest of Vouziers, and six tenths of Mezières. The place contains 950, and the canton 6136; inhabitants; the territory includes 165 kilometres and 17 commune.

Attilla, in Biography and History, king of the Huns, and by the modern Hungarians denominated "The Scourge of God," was the son of Muzulak, and reduced his defeat from the ancient Huns, who had formerly contended with the monarchs of China. Indeed the modern Hungarians have traced his genealogy upwards, in the thirty-fifth degree, to Ham, the son of Noah. At the death of Rugas, A. D. 433, his two nephews, Attila and Bleda, succeeded to the throne of their ancestors. Having concluded an humiliating peace with the emperor Theodosius II., they extended their arms towards the north with so much success, as to reduce all the nations between the Danube and the Danube under their dominion. Under pretence of an offence given them by the Romans, they made an irruption into the eastern empire, took several towns on the banks of the Danube by storm, defeated several imperial armies, and laid waste the whole adjacent country with fire and sword. Theodosius, thinking him self in security at Constantinople, retired into Acha, and was glad to purchase an inglorious peace. At this time the two nephews of Rugas flared the government of the Huns; but Attila, whole ambition admitted of no partnership in power, caused Bleda to resign both his sceptre and his title, and acquired the sole sovereignty of the nation and its dependent territories. The extent of his empire affords the only evidence of the number and importance of his victories. If a line of separation were drawn between the civilized and the savage climates of the globe; between the inhabitants of cities, who cultivated the earth, and the hunters and shepherds who dwell in tents; Attila might aspire to the title of an immense and sole monarch of the Barbarians. He alone, among the conquerors of ancient and modern times, united the two mighty kingdoms of Germany and Scythia, in their most ample latitude; Thuringia, extending to the Danube, was in the number of his provinces; he interposed with the authority of a powerful neighbour, in the domestic affairs of the Franks; and one of his lieutenants, his benefactors, and almost exterminated, the Burgundians of the Rhine. He subdued the islands of the ocean, the kingdoms of Scandinavia, encompassed and divided by the waters of the Baltic; towards the east, his dominion extended over the Scythian deserts to the banks of the Volga; and he sent ambassadors to negotiate an equal alliance with the empire of China. He also reckoned among his subjects the numerous and warlike tribes of the Gepidae and Obtrogos. The crowd of Volga kings, the leaders of so many martial tribes, who feared under the standard of Attila, were ranged in the fulminating order of guards and domesticity, round the periphery of their matter. They watched his nod; they trembled at his frown; and, at the first signal of his will, they executed, without murmuring or hesitation, his biam and absolute command. In time of peace, the dependent princes, with their national troops, attended the royal camp in regular succession; but when Attila collected his military force, he was able to bring into the field an army of five, or, according to another account, of 700,000 Barbarians? The portrait of Attila, says Jornandes, a Gothic historian, exhibits the genuine deformity of a modern Calmuck; with a large head, a fourthly complexion, small deep-set eyes, a flat nose, a few hairs in the place of a beard, broad shoulders and a short square body, of nervous strength, though of a disproportioned form. He was a bountiful and generous man, who from expressed qualities of a superior; and by fiercely raking his eyes, he seemed to enjoy the terror which he inspired. Nevertheless, this savage hero was not inacessible to pity; his filial enemies might indulge in the assurance of pardon and peace; and Attila was regarded by his subjects as a just and indulgent master. His delight was war, and he indulged his passion for it to the destruction of myriads. Approached by the influence of superstition over ignorant and savage minds, he availed himself of it, as a collateral and useful instrument for the accomplishment of his purposes. According he pretended to have discovered, by means of a shepherd, the famous sword of the Scythian Mars; and being in possession of this, he asserted his divine and indestructible claim to the dominion of the earth. As the favourite of Mars, whom he propitiated by bloody rites and sacrifices, Attila soon acquired a ferocious character, which rendered his conquests less easy and more effectual. In the end, he was defeated in battle by the Barbarian princes confederated, in the language of devotion, or of battery, that they could not presume to give, with
ATTILUS, king of the Visigoths, in Languedoc. With this view he assembled, in 451, an inconsiderable body of northern Barbarians, and without opposition crossed the Rhine. In his progress through Gaul, he defeated the country, pillaged and burnt several cities, and at length laid siege to Orleans. Here he was overtaken by the armies of Theodoric, and of the empire, under count Erigus, who obliged him to retire. After the bloody battle of Chabons, he marched without molestation to the confines of Thuringia, where he crossed the Rhine, and continued his progress to Pannonia. At the commencement of the following year, Attila, having recruited his forces, passed the Alps, entered Italy, and invaded Aquileia, which he utterly destroyed. He then ravaged Lombardy, sacked and reduced to ashes many of their towns; and thus, by means of the fugitives who fled from the terror of his name, was unintermittently instrumental in laying the foundation of the Venetian republic. Valentinian, incapable of resistance, fled from Ravenna to Rome, and sent a deputation to Attila, at the head of which was Leo, bishop of Rome, for the purpose of appeasing his wrath, and proposing terms of accommodation. Attila consented to leave Italy, on the payment of a very large sum, as the dowry of the princess Honorina, and an annual tribute. But this was only a temporary truce; as he threatened to return the next year, if Honorina and her dowry were not punctually transmitted to him. Attila, however, did not long survive his return into his own country. Having added to the number of his wives a beautiful young virgin, whose name was Hedica, he celebrated his marriage with great pomp and festivities at his wooden palace beyond the Danube; and, oppressed with wine and feasts, he retired at a late hour to the nuptial bed. In the night a blood-stained burst, and as he lay in a supine posture, he was suffocated by a torrent of blood. His attendants found the tumbling bride fitting by the side of the bed, hiding her face with a veil, and lamenting the death of the king, as well as her own danger. His body was exposed in the midst of the plain, under a sullen pavilion; and “the chosen squadrons of the Huns, wheeling round in measured evolutions, chanting a funeral song to the memory of a hero glorious in his life, invincible in his death, the father of his people, the scourge of his enemies, and the terror of the world. According to their national custom, the Barbarians cut off a part of their hair, gashed their faces with unfeeling wounds, and bewailed their valiant leader as he defied, not with the tears of women, but with the blood of warriors. The remains of Attila were inclosed within three coffins, of gold, of silver, and of iron, and privately buried in the night; the spoils of nations were thrown into the grave; the captives who had opened the ground were inhumanly massacred; and the Huns, who had indulged such excessive grief, feasted with dilute and intemperate mirth about the recent sepulchre of their king.” The death of Attila is commonly dated in the year 453; but some in 454. With him the empire of the Huns terminated; for, after his death, his numerous sons either destroyed one another by their mutual contelli, or were dispossessed by those bold chieftains who aspired to the rank of kings. Anc. Ur. Hist. vol. xvii. p. 147—159.

ATTILE, ATTILUM, in Antiquity, denotes the rigging or furniture of a ship. Plut. i. c. 25.

ATTILUS, in Ichthyology, a term synonymous with adella, adano, and adalus Auctorum; and applied by Pliny and Rondeletius to the variety B of the Linncean Acipenser fluvi, or commonurgeon.

ATTINGA AMERICANA, in Ornithology, a name by which
ATTIRE, in Botany, is used by some to denote the third part or division of the flower of a plant; the other two being the perianth and the siliqua.

The term is of two kinds, uniflorum and florid. The uniflorum attires consist of two parts; chives or flaminia, and feminites or anices, one upon each flamen.

The florid attire is usually called the throns, as in the flowers of many gold, taffy, &c. These throns are called suata, which consist of two, but most times of three pieces. And the outer part of the suit is the floret, whose body is divided at the top like a cowflit flower, into five parts, or distinct leaves.

ATTIRE, in Heraldry, signifies a single horn of a flag. ATTIRE, in Hunting, denotes the head and horns of a deer. The attire of a flag, if perfect, consists of bar, peals, beam, gutters, anle, fur-anle, royal, fur-royal, and croches:—of a buck of the bar, beam, brow-anle, adder, palm, and spellers.

ATTIRE, in Heraldry, a term used in speaking of the horns of a flag, hart, or buck.

ATTIUM, in Ancient Geography, a promontory on the western coast of the island of Cusica; now called Punta di Acriato.

ATTLEBOROUGH, in Geography, a township of America, in Bristol county, Massachusetts, eighty-two miles south from Boston, and nine north from Providence.

ATTLEBURY, a town in England, in Norfolk, distant N.E. from London ninety-four miles.

ATTMELLA. See Acemella.

ATTNANG, in Geography, a town of Germany, in the archbishopry of Salzburg, one mile W.S.W. of Schwazwaldt.

ATTOCK, a city and fortress of Hindoostan, on the eastern bank of the Indus, built by Akbar in 1581, to command the passes that lead from Cabul to Lahore. This pass is so confined, either by the nature of the banks, or of the channel of the river, or both, that the passage from the landing place leads through the very tortuosity itself. The ancient Tadjik, where Alexander crossed the Indus, stood on or near to the site of Attok. N. lat. 33° 6'. E. long. 71° 15'. That part of the river Indus, called also Tishah and Sindah, that separates the province of Lahore from Paibaw or, is denominated the Attok, probably from the city founded on its banks. At Attok, the river Cabul, after receiving the rivers of Sevaud, Bijore, &c., joins the Indus, and very considerably increases it. For though the Indus is sometimes fordable above Attok, and Mr. Forster actually ford it at twenty miles above this place, July 20th, 1775; we never hear of its having been forded below that point.

Two Attok downs towards Mouland, or to the confluence of the Rajah waters, this river (says Major Kennell) has obtained the name of Attok; but spoken of generally, it is called Sind.

ATTOLLENS, compounded of the Latin ad, to, and taile, taffe, in Anatomy, a name common to several muscles, whose office or action is to raise the parts they belong to.

The attendant muscles are otherwise called levatores and elevatoris.
of Westminster-hall; and are in all points officers of the respective courts in which they are admitted; and as they have many privileges on account of their attendance there, so they are peculiarly subject to the confines and animadversion of the judges. No man can practice as an attorney in any of those courts, but such as is admitted and sworn an attorney of that particular court; an attorney of the king's bench cannot practice in the court of common pleas; nor vice versa. 'To practice in the court of chancery, it is also necessary to be admitted a solicitor thereto; and by the 22 Geo. II. c. 26, no person shall act as an attorney at the court of quarter sessions, but such as has been regularly admitted in some superior court of record. With respect to the several courts, there are attorneys at large, and attorneys special belonging to this or that court only. An attorney may be a solicitor in other courts by a special retention; one may be an attorney on record, and another do the business; and there are also attorneys who manage the business out of the courts. So early as the statute 4 Hen. IV. c. 18, it was enacted that attorneys should be examined by the judges, and none admitted but such as were virtuous, learned, and fear to do their duty. And many subsequent statutes have laid them under further regulations. By 3 Jac. I. c. 7, attorneys, &c. shall not be allowed any fees laid out for counsel, or otherwise, unless they have tickets thereof signed by them that receive such fees, and they shall give in true bills to their clients of all the charges of suits under their hands, before the courts shall be charged with the payment thereof. If they delay their client's suit for gain, or demand more than their due fees or disbursements, the client shall recover costs and treble damages; and they shall for ever after be disabled to be attorneys. None shall be admitted attorneys in courts of record, but such as have been brought up in the said courts, or are well skilled, and honest; and no attorney shall suffer any other to follow a suit in his name, on pain of forfeiting 20 l. to be divided between the king and the party aggrieved. By 12 Geo. I. c. 29, if any person who hath been convicted of forgery, perjury, subornation of perjury, or common barratry, shall practice as an attorney or solicitor in any suit or action in any court, the judge where such action shall be brought hath power to transport the offender for seven years, by such ways and under such penalties as felon. The act 2 Geo. II. c. 23, orders that all attorneys shall be sworn, admitted, and enrolled, before they sue out writs in the courts of Westminster; and they are required to have served a clerkship of five years, and to be examined, sworn, and admitted in one court, and attorneys shall not have more than two clerks at one time, except the prothonotaries in the common pleas, and the secondary in the king's bench, and the several prothonotaries in the counties palatine and great seashores in Wales, each of whom may have three. Attorneys, upon being sworn and admitted, shall pay a stamp-duty, by several acts of 166. When the attorney's bills are taxed, he is to pay the costs of taxation, if the bill be reduced a fifth part. A penalty of 50 l. and disability to practice, are the consequences of acting contrary to this statute. By flat. 6 Geo. II. c. 27, attorneys of the courts at Westminster may practice in inferior courts. By 12 Geo. II. c. 13, attorneys, &c. that act in any county-court, without admission according to the statute 2 Geo. II. c. 23, shall forfeit 20 l. and no attorney who is a prisoner, shall sue out any writ, or prosecute suits; if he doth, the proceedings, &c. shall be void, and such attorney, &c. shall be struck off the roll. By 22 Geo. II. c. 46, per sons bound clerks to attorneys or solicitors are to enail affidavits to be made and filed of the execution of the articles, names, and places of abode of attorney or solicitor, and clerk; and none to be admitted till the affidavits be produced and read in court. Clerks are actually to serve during their whole time, and make affidavits thereof. Persons admitted forwa clerks in chancery, or serving a clerkship to such, may be admitted solicitors. By 23 Geo. II. c. 29, any person duly admitted a solicitor, may be admitted an attorney without any fee for the oath, or any stamp; and by the 2 Geo. II. c. 23, 20. attorneys may be admitted solicitors. By 25 Geo. III. c. 30, every admitted attorney, solicitor, notary, procurator, or proctor, shall annually take out a stamped certificate, with a five pound stamp within the bills of mortality, and three pound elsewhere, from the court in which they practice, on penalty of 50 l. and incapacity of practicing. By 33 Geo. III. c. 12, every person who shall become bound to serve as a clerk in ord. to his admission as a solicitor or attorney in any of the courts at Westminster, shall be charged an additional stamp-duty of 100 l. And in any of the courts of great sessions in Wales, or in any of the counties of Chester, Lancaster, or Durham, or in any court of record in England holding pleas, where the debt or damage shall amount to 40 s. and not in any of the said courts at Westminster, a stamp-duty of 50 l. And by the several stamp acts, if the consideration money given with such clerk or apprentices be under 10 l., a stamp duty of 3 s. If above 10 l. be given by 37 Geo. II. c. 3, 106. mor. The indentures shall be enrolled, and affidavit shall be made within six weeks. Persons who have paid the duty of 100 l. in any of the courts at Westminster, may be admitted in any of the other courts without payment of any further duty. New contracts with other makers are subject to no further duty. The privileges belonging to attorneys are as follow: an attorney, in respect of his attendance at the courts, cannot be precluded for a felony; but he is not privileged from serving in the militia, or finding a substitute: an attorney shall not be made liable, nor be elected into any other office against his will; as to the office of overseer of the poor, or churchwarden, or any office within a borough. Attorneys have the privilege to sue and be sued only in the courts at Westminster, where they practice; they are not obliged to put in special bail, when defendants; but when they are plaintiffs, they may inflict upon special bail in all bailable causes. 1 Vent. 259. Wood's Ind. 450. But an attorney of one court may, in that court, hold an attorney of another court to bail. Payment to the attorney is payment to the principal. Doug. 623. 1 Black. R. 8. An attorney has a lien in the money recovered by his client, for his bill of costs; if the money come to his hands, he may retain to the amount of his bill. He may flip it in transfus, if he can lay hold of it; if he apply to the court, they will prevent its being paid over until his demand is satisfied. If the attorney give notice to the defendant not to pay till his bill be discharged, a payment by the defendant after such notice would be in his own wrong, and like paying a debt which has been alligned after notice. Doug. 238.

Attorneys are liable to be punished in a summary way, either by attachment, or having their names struck out of the roll, for ill practice, attended with fraud and corruption, and committed against the obvious rules of justice and common honesty; but the court will not easily be prevailed upon to proceed in this manner, if it appears that the matter complained of was rather owing to neglect or accident than design, or if the party injured has other remedy by act of parliament, or action at law. 12 Mod. 251, 518. 449. 583. 657. 4. Mod. 567. If an attorney, defendant in an action, does not appear in due time, the plaintiff may sign a "for seven," which enables him to strike the defendant
Attorneys are sometimes struck off the roll on their own application, for the purpose of being called to the bar, &c.; and in this case they must be disbarred by their peers, before they are re-admitted attorneys. Doug. 144. An attorney convicted of felony is struck off the roll. Comp. 829. Attorneys are also liable to be punished for false and unfair dealings towards their clients in the way of business, as for protracting suits by little shifts and devices, and putting the parties to unnecessary expense, in order to raise their bills; or demanding fees for business that was never done; or for refusing to deliver up their clients' writings with which they had been intrusted in the way of business, or money which has been recovered and received by them to their clients' use, and for other such like gross and palpable abuse.

Attorney-General, is a great officer under the king, made by letters patent. It is his province to exhibit informations, and to prosecute for the crown, in matters criminal; and to file bills in the Eschequer, for any thing concerning the king in inheritance or profits; and others may bring bills against the king's attorney. His proper place in court, upon any special matters of a criminal nature, in which his attendance is required, is under the judges, on the left hand of the clerk of the crown; but this is only upon solemn and extraordinary occasions; for usually he does not sit there, but within the bar in the face of the court.

Attorney, Letter of. See Letter.

Attorney, Warrant of. See Warrant.

ATTENTION, or ATTORNMENT, a transferring of duty and service to another lord; or an acknowledgment which a tenant makes of homage and service to a new lord.

By the nature of the feudal connection, it was not thought reasonable nor allowed, that a feudatory should transfer his lord's gift to another, and substitute a new tenant to do the service in his own stead, without the consent of the lord; and, as the feudal obligation was considered as reciprocal, the lord also could not alienate his feignory without the consent of his tenant, which consent of his was called an "attornment." This doctrine of attornment was afterwards extended to all leases for life or years. For if one bought an estate with any lease for life or years standing out thereon, and the lessee or tenant refused to attorn to the purchaser, and to become his tenant, the grant or contract was in most cases void, or at least incomplete (Lit. 5, 551.) which was an additional cog upon alienations. But after the statute "quia cepitors terrarum" (18 Ed. I. fl. 1.), was passed, by which subinfeudation was prohibited, it became necessary that when the reversion or remainder-man after an estate for years, for life or in tail, granted his reversion or remainder, the particular tenant should attorn to the grantee. The necessity of attornment was, in some measure, avoided by the statute of uges (27 Hen. VIII. c. 10), as by that statute, the possession was immediately executed to the uge; and by the statute of "Harte" (34 & 35 Hen. VIII. c. 5), by which the legal estate is immediately vested in the device.

Attornments, however, still continued to be necessary in many cases; but both their necessity and efficacy are now almost wholly taken away; for by Stat. 4 & 5 Ann. c. 16, it is enacted, that all grants and conveyances of manors, lands, rents, and reversions, &c. by fine or otherwise, shall be good, without the attornment of the tenants; but notice must be given of the grant to the tenant, before which he shall not be prejudiced by the payment of any rent to the grantor, or for breach of the condition for non-payment. And by Stat. 11 Geo. II. c. 19, attornments of lands, &c. made by tenants to strangers claiming title to the estate of their landlords shall be null and void, and their landlord's possession not affected thereby; though this shall not extend to vacate any attornment made pursuant to a judgment at law, or with consent of the landlord; or to a mortgagee on foreclosed mortgage. Till these statutes were passed, the doctrine of attornment was one of the most copious and abstruse points of the law. But these acts having made attornment both unnecessary and inoperative, the learning upon it may be deemed almost entirely useless. 1 Tint. 529. Jacob's Law Dict. by Tomlin, Hist. Attornw.

ATTOWAI, in Geography. See ATROO.

ATTRACTION, in Natural Philosophy, a general term used to denote the power or principle, by which all bodies mutually tend towards each other, without regarding the cause or kind of action that may be the means of producing this effect.

The existence of a principle of this kind is so clearly manifested by many of the most common phenomena of nature, which fall under our daily inspection, that it must have been known in very early times; but the information we have hitherto obtained of the progress made by the ancients in physical investigations, is too vague and obscure to afford any proof of their ever having applied the action or influence of this power to the purposes of science. The philosopher Anaxagoras, who flourished about 500 years before the Christian era, is reported, by Diogenes Laertius, to have attributed to the celestial bodies a tendency towards the earth, which he considered as the centre of their motions; and the doctrines of Democritus and Epicurus are founded upon the same principle, as appears from their elegant interpreter Lucretius, who thence derives the confluence of the universe being without bounds. But though some bold and original characters had embraced these opinions, it is no less certain, from the testimonies of other writers, that they were far from being generally received in the ancient world.

The first, among the moderns, who appears to have had just notions of this doctrine was, Nicholas Copernicus, the celebrated reforer of the old Pythagorean syllem of the universe; who in his work "De Revolution. Orb. Celoet." (lib. i. c. 9), expressed himself thus: "I consider gravity as nothing more than a certain natural apperture (applicatio) that the Creator has impress'd upon all the parts of matter, in order to their uniting and coalescing into a globular form for their better preservation; and it is probable that the same power is also inherent in the sun, moon, and planets, that those bodies may constantly retain that round figure in which we behold them." He also considered the sun as the chief governing power of all the rest, as may be inferred from some of the late words of Tycho Brahe, who receiving the approach of death, called for the celebrated Kepler (then a young man, and his assistant in his observatory at Prague), and after charg'ng him with completing the Astronomical Tables which he had left unfinished, thus addressed him: "My friend, although what I acribe to a voluntary, and as it were, an obsequious motion of the planets round
the sun, you attribute to an attractive energy of that body, yet I mult esteem, that, in the publication of my observations, you would explain all the celestial motions by my hypothesis, rather than by that of Copernicus, which I know you would otherwise incline to follow." (Life of Tycho Brahe.)

Kepler, however, in his own works, constantly maintains the doctrine of attraction, and even carries it farther than Copernicus had ever done. Thus, he calls gravity "a corporeal and mutual affection between similar bodies, in order to their motion." He also remarks, with Copernicus, against the Peripatetics, that "the heavenly bodies do not tend to the centre of the universe, but to the centre of these larger round bodies, of which they make a part; so that if the earth were not spherical, things would not fall from all points towards its centre. If a stone, for instance, were to be placed at a distance from another stone, in any part of the universe, without the sphere of action of a third body like two magnets, they would come together in some intermediate point; each advancing, in space, in the inverse proportion of their quantities of matter. Hence, if the moon and the earth were not kept together by some power, in their respective orbits, they would move towards each other; the moon falling over fifty-three parts of the way while the earth passed over one, supposing their densities equal." (Afron. Nov. in Introd.)

From the same principle, Kepler also accounted for the general motion of the tides; viz., by the attraction of the moon, and expressly calls it virtus trahoriae quae in luna eff; adding, that if the earth did not exert an attractive power over its own waters, they would rise and submerge to the moon. We also find him suspecting that certain irregularities in the motion of the moon are owing to the combination of the earth and sun upon this body. (Ibid.)

These and other reflections concerning the universality of attraction, he accompanies with an ingenious anticipation of a law of nature, from conjecture only, but which was afterwards verified by experiment. The schools had taught that some bodies were by their nature heavy, and so fell to the ground; and that others were naturally light, and for that reason ascended. But Kepler pronounced, that no bodies whatever are absolutely light, but only relatively so; and consequently that all matter is subject to the law of gravitation. So far the genius of Kepler was fortunate in tracing out the great principle which governed the planet, from flying off from the sun; but his sagacity failed him, when he endeavoured to chew by what means they were kept from falling into that immense body, and what power perpetuated their motion in their orbits: a general investigation of the laws of motion was yet wanting; the discovery of which, as well as many other things, being referred, as he himself prophesied at the end of his work, "for the succeeding age, when the Author of nature would be pleased to reveal these mysteries."

The first person in this country, who embraced the doctrine of attraction, was Dr. Gilbert, a native of Colchester, and a physician at London, in a work published in the year 1620, intitled, "De Magnete Magnetisque Corporibus," which contains a number of curious things; but he did not properly distinguish between attraction and magnetism. The next after him was lord Bacon, who, though not a convert to the Copernican system, yet acknowledged the attractive power in matter (Nov. Organ. lib. ii. chap. 36. 45. & 48.) and in the dawn of philosophy, in which he lived, he constantly recommends an inquiry into the physical causes and reasons of things, observing, "that he who shall duly attend to the appetences and general affections of matter (which both in the earth and heavens are exceedingly powerful, and indeed pervade the universe) will receive, from what he sees falling on the earth, clear information concerning the nature of the celestial bodies; and, contrariwise, from motions which he shall discover in the heavens, will learn many particulars relating to the things below, which now he concealed from us." (De Dig. & Augm. Selon. lib. ii. c. 4.)

In France, also, we find Fermat and Roberval, mathematicians of great eminence, maintaining the same opinion. The latter, in particular, made it the fundamental principle of his system of physical astronomy, which he published in 1654, under the title of "Arill. Sane de Mundi Systema:" In this work, Roberval attributed to all the parts of matter of which the universe is composed, the property of having a tendency towards each other: observing, that this is the reason why they arrange themselves in spherical figures, not by virtue of a centre, but by their mutual attractions, and so that one may be placed in an equilibrium with another. Galileo, in Italy, had likewise conceived this idea; but with far less precision and extension than we find it in his contemporaries Bacon and Kepler.

But no one, before Newton, had entertained such just and clear notions of the doctrine of universal gravitation, or had approached so near to the making a general application of it to the laws of nature, as the celebrated Dr. Hooke. The philosophers before mentioned had feized some one branch, and from another; but Hooke, in his work, called "An Attempt to prove the Motion of the Earth," 1674. 410., appears to have embraced it in nearly the whole of its generality. He there observes, that the hypothesis upon which he explains the system of the world, is, in many respects, different from all others; and which is founded upon the three following principles: 1. That all the celestial bodies have not only an attraction or gravitation towards their proper centres, but that they mutually attract each other within their sphere of activity. 2. That all bodies which have a simple and direct motion, continue to move in a right line, if some force, which operates without ceasing, does not constrain them to describe a circle, an ellipse, or some other more complicated curve. 3. That attraction is so much the more powerful, as the attracting bodies are nearer to each other.

He also made several experiments with a view to strengthen the preceding conjectures. For this purpose, he suspended a weight, and then, after it had been made to oscillate, he impressed upon it a small lateral motion, and remarked, that the bullet described an ellipse, or a curve of that form, round the vertical line. He then attached to the firing of the first bullet, another, which carried a smaller one; and after having given to the latter a circular motion round the vertical line, he put the other in motion, as in the former experiment; when it was found, that neither one nor the other described an ellipse, but moved round a point at a mean distance between them, which appeared to be their centre of gravity. (Life of Dr. Hooke, prefixed to his posthumous works.)

This was certainly very ingenious; but Hooke did not consider that the centre of force refides in one of the foci of the ellipse, and not in its centre; and though the observation was suggested to him, and he was even excited by the promise of a very considerable reward, to determine the law of attraction, which would occasion a body to describe an ellipse round another quiescent body, placed in one of its foci, he was unable to accomplish the undertaking. The problem, which belongs to the higher geometry, was too difficult for that time; this admirable discovery, which does the highest honour to the human mind, being referred for
the genius of Newton; and though Hooke claimed a share of the glory of this discovery, it was without the smallest foundation; as his conjectures were far short of the proofs which were required in the sublime demonstration by which the former established this law of the universe.

Such was the progress of the sytem of universal gravitation, when this extraordinary man first appeared; who, according to Pemberton (View of Sir Isaac Newton's Philosophy, 1725, 4to.), first began about the year 1665, to suspect the existence of this principle, and to attempt to apply it to the celestial motions. Having retired into the country to avoid the plague, which about this time prevailed in London and its vicinity, his meditations turned upon the nature of gravity; and one of his first reflections appears to have been, that this power, which, by its continual action, occasions the fall of bodies towards the surface of the earth, to whatever height they are taken, might possibly extend much farther than was commonly imagined; as, for instance, to the distance of the moon or full Jupiter. And if so, he began to consider that it might be this force which retained the moon in her orbit, by counterbalancing the centripetal force which arises from her revolution round the earth. It also occurred to him at the same time, that though this power appears to suffer no diminution at any heights to which we can ascend, these being comparatively extremely small, yet it was highly probable, that, at very great distances from the earth, it might be considerably weakened.

In following therefore this conjecture, he was farther led to conceive, that if the attraction of the earth was the cause of retaining the moon in her orbit, the planets, in like manner, must be retained in their orbits by the attractive forces of the sun; and as the squares of the times of the revolutions of the planets had been found by Kepler to be proportional to the cubes of their mean distances from the sun, it followed that the diminution of their centrifugal forces, and of course that of gravity, would be reciprocally as the squares of their distances from that body. Hence, from the experiments which had been already made on the deflection of heavy bodies at small elevations, he determined the height from which the moon, if left freely to herself, would decline towards the earth in a short interval of time: this is well known to be the vered line of the arc that she describes in that time; and which, by means of the lunar parallax, may be determined in parts of the earth's radius; so that to compare the diminution of gravity with the observations, nothing more was necessary than to know the magnitude of this line.

But Newton, having at that time only an incorrect measure of the terrestrial meridian, obtained a result considerably different from that which he expected; whence, imagining that some unknown forces might be connected with the gravity of the moon, he abandoned his first ideas. Some years afterwards, however, his attention was again called to the subject by a letter of Dr. Hooke; and as Picard, about this time, had measured a degree of the earth in France with great exactness, he employed this measure in his calculations instead of the one he had before made use of, and found, by that means, that the moon is retained in her orbit by the sole power of gravity, supposed to be reciprocally proportional to the squares of the distances.

According to this law, he also found that the line described by bodies in their descent is an ellipse, of which the centre of the earth occupies one of the foci; and considering, afterwards, that the orbits of the planets are, in like manner, ellipses, having the centre of the sun in one of their foci, he had the satisfaction to perceive, that the solution which he had undertaken, only from curiosity, was applicable to some of the most sublime objects of nature. These discoveries gave birth to his celebrated work entitled, "Philosophiae Naturalis Principia Mathematica," which appeared in 1677; and is justly considered as one of the greatest monuments that his ever been erected by human genius to the honour of science.

In generalizing these researches, this profound geometer afterwards showed, that a projectile may describe any conic section whatever, by virtue of a force directed towards its focus, and acting in proportion to the reciprocal squares of the distances. He also developed the various properties of motion in these kinds of curves, and determined the necessary conditions, so that the section should be a circle, an ellipse, a parabola, or an hyperbola, which depend only upon the velocity and primitive position of the body; allaging in such case, the conic section which the body would describe. He also applied these relations to the motion of the satellites and comets, shewing that the former move round their primaries, and the latter round the sun, according to the same law; and he pointed out the means of determining, by observation, the elements of these ellipses.

In considering that the satellites move round the planets in nearly the same manner as if their planets were quiescent, Newton perceived that they must all equally gravitate towards the sun. The equality of action and reaction did not allow him to doubt that the sun gravitates towards the planets, as well as these towards their satellites; and that the earth is attracted by all the bodies that are attracted towards her. He afterwards extended, by analogy, this property to all the parts of which bodies are composed, and established it as a principle, that every molecule of matter attracts every other body in proportion to its mass and reciprocity as the square of the distance from the body attracted.

Having arrived at this principle, Newton soon saw that all the great phenomena of the system of the world might be easily derived from it. In considering the force of gravity at the surface of the celestial bodies as the refutante of the attractions of all their molecules, he arrived at these remarkable conclusions: that the attractive force of a body, or spherical stratum, on a point placed without it, is the same as if the whole of its ma$s was united in the centre; and that a point placed within the body, or more generally in any stratum terminated by two similar ellipsoidal surfaces, similarly situated, is equally attracted in all parts. He also proved that the rotation of the earth upon its axis must occasion a flattening of it about its poles, which was afterwards verified by an actual measurement; and he determined the law of the variation of the degrees, in different latitudes, upon the supposition that the matter of the earth was homogeneous. He likewise saw, that the actions of the sun and moon upon the terrestrial spheroid, must produce a movement of rotation of its axis, as well as occasion a retrocession of the equinoxes, and the various oscillations of the waters of the ocean which are called the tides. In short, he also assured himself, that the inequalities of the motion of the moon arise from the combined actions of the sun and earth upon this satellite.

But, with the exception of what concerns the elliptical motions of the planets and comets, and the attractions of spheroidal bodies, these discoveries were not wholly completed by Newton. His theory of the figures of the planets is limited by the supposition of their homogeneity; and his solution of the problem of the precession of the equinoxes, although extremely ingenious, and nearly agreeing with the results obtained from observations, is defective in several respects; as among the great number of perturbations of the celestial motions, several small ones, and particularly
that which arises from the evocation of the moon, escaped his researches. He has perfectly established the principle which he had discovered; but left the complete development of its consequences and advantages to the geometers that should succeed him.

The profound analysis, of which this great man was also the inventor, had not, at this time, been sufficiently perfected, to enable him to give complete solutions to all the difficult problems which arise in considering the theory of the system of the world; so that he was sometimes obliged to give only imperfect sketches or approximations, and leave them to be verified by a more rigorous calculation. But, notwithstanding these inevitable defects, the importance and generality of his discoveries, and the great number of his original and profound views, which have given rise to the most brilliant mathematical theories of the present age, will always afford to this performance the pre-eminence above every other similar production of the human mind.

Having thus given a concise history of the discovery of this extensive principle, and its application to the laws of motion, it is proper to observe, that though Newton makes use of the word attraction in common with the school philosophers, yet he very judiciously distinguishes between the ideas. The ancient attraction was supposed to be a kind of quality, inherent in certain bodies themselves, and arising from their particular or specific forms; but the Newtonian attraction is a more indefinite principle, denoting no particular kind or manner of action, nor the physical causes of such action, but only tendency in the general, a conatus ascendentis, to whatever cause, physical or metaphysical, such effects are owing, whether to a power inherent in the bodies themselves, or to the impulse of an external agent.

He accordingly shows in his Philosop. Nat. Prin. Math. that he uses the words attraction, impulsion, and propension to the centre, indifferently; and cautions the reader not to imagine, that by attraction he expresses the modus of the action, or the efficient cause thereof, as if there were any proper powers in the centres, which in reality are only mathematical points; or as if centres could attract. Lib. i. p. 5.

In like manner he considers centripetal powers as attractions, though physically speaking, it were more just to call them impulsi. Lib. p. 148. He also adds, that what he calls attraction may possibly be effected by impulse, though not a common or corporeal impulse, but after some other manner unknown to us. Optics, p. 322.

Attraction indeed, if considered as a quality arising from the specific forms of bodies, ought, together with sympathy, antipathy, and the whole tribe of occult qualities, to be exploded. But when we have set these aside, there will remain innumerable phenomena of nature, and particularly the gravity or weight of bodies, or their tendency to a centre, which argue a principle of action seemingly distinct from impulse, or where at least there is no sensible impulsion concerned. It is also well known, that this action differs, in some respects, from all impulsion we know of, the latter being always found to act in proportion to the surface of bodies; whereas gravity acts according to their solid contents; and consequently must arise from some cause that penetrates or pervades their whole substances. This unknown principle, which can be considered to only with respect to its cause (for its phenomena and effects are most obvious), with all the species and modifications of it, is what we call attraction, which is a general name under which all mutual tendencies, where no physical impulsion appears, and which cannot therefore be accounted for from any known laws of nature, may be ranged; and here arise several particular kinds of attractions, as gravity, magnetism, electricity, &c. which are so many different laws; and only agreeing in this, that we do not see any physical causes of them; but that as to our senses, they may really arise from some power or efficacy in such bodies, by which they are enabled to act, even upon distant bodies, though our reason absolutely disallows of any such action.

Attraction may be divided with respect to the law it observes, into two kinds: 1. That which extends to sensible distances; such are the attractions of gravity found in all bodies; and the attraction of magnetism and electricity found in some particular bodies; the several laws and phenomena of which see under their respective articles. 1

Among these, the attraction of gravity, which is also called the centripetal force, is one of the greatest and most universal principles in nature; we see and feel it operate on bodies near the earth, and find by observation, that the same power also obtains in the moon, and in both the primary and secondary planets, as well as in the comets; and that this is the power by which they are all retained in their orbits, &c. and hence, as gravity is found in all the bodies which come under our observation, it is easily inferred, by one of the settled rules of philosophizing, that it obtains in all others; and as it is found to be as the quantity of matter in each body, it must be in every particle thereof; and hence, every particle in nature is proved to attract every other particle, &c. See the demonstration of this laid down at large under the articles Centrifugal, Centripetal, Comet, Moon, Newtonian Philosophy, Planet, Satellite, Sun, &c.

From this attraction arises all the motion, and consequently all the mutation, in the universe; by this, heavy bodies descend and light ones ascend, projectiles are directed, vapours and exhalations arise, and rains, &c. fall. Also from the same cause rivers glide, the air preys, the ocean swells, &c. In effect, the motions arising from this principle, make the subject of that extensive branch of mathematics called Mechanics, or Statics, with the parts or appendages thereof Hydrostatics, Pneumatics. See Mathematics, Philosophy, &c.

2. That which extends only to small distances. — Such is found to obtain in the minute particles whereof all bodies are compounded, which attract each other at or extremely near the point of contact, with a force much inferior to that of gravity; but which at any distance from it decreases much faster than the power of gravity. This power is known by the name of the Attraction of Cohesion, as being that by which the atoms or sensible particles of bodies are united with larger and more sensible figures, See Cohesion.

The latter kind of attraction owns Newton for its discoverer, as the former does for its improver. The laws of motion, percussion, &c. in sensible bodies under various circumstances, as falling, projected, &c. ascertained by the latter philosophers, do not reach to those more remote intelline motions of the competent particles of the same bodies, on which the changes of their texture, colour, properties, &c. depend; so that our philosophy, if it were founded wholly on the principle of gravitation, and carried no farther than that would lead us, would necessarily be very deficient.

But besides the common laws of sensible masses, the minute parts which they are compounded of are found subject to some others which have been only of late taken notice of, and are yet very imperfectly known. Newton, to whose happy penetration we owe the hint, contents himself with establishing that there are such motions in the minima naturae, and that they flow from certain powers or forces...
not reducible to any of those in the great world.—By virtue of these powers he means, *that the small particles act on each other even at a distance, and that many of the phenomena of nature are the result of this action. Sensible bodies, as we have already observed, act on each other several ways; and as we thus perceive the tenor and course of nature, it appears highly probable that there may be other powers of the like kind, nature being always uniform and consistent with herself.—Those just mentioned, reaching to small distances, have been generally observed; but there may be others, which reach to such small distances as have hitherto escaped observation; and this, it is probable, may be the case with electricity, even without being excited by friction.

He then proceeds to confirm the reality of these suppositions from a great number of phenomena and experiments, which plainly argue such powers and actions between the particles of bodies, e. g. of salts and water, oil of vitriol and water, aqua fortis and iron, spirit of vitriol and salt-petre, and many other chemical substanthes. He also shows that these powers are mutually strong between different bodies; e. g. stronger between the particles of salt of tartar and those of aqua fortis, than those of silver; and between aqua fortis and lapis calaminaris, than iron; between iron and copper, than silver, or mercury, &c. So spirit of vitriol acts on water, but more on iron or copper, &c. The other experiments which countenance the existence of such principles of attraction in the particles of matter are innumerable, many of which may be found enumerated under the articles Affinity, Acid, Matter, Menstrum, Salt, &c.

These actions, by virtue of which the particles of the bodies above mentioned tend towards each other, are called by the general indefinite name attraction, which is equally applicable to all actions by which distant bodies tend towards each other, whether by impulse, or by any other more latent power; and hence we can account for an infinity of phenomena which would otherwise be inexplicable from the principle of gravity: such as cohesion, diffusion, conglutination, crystallization, the ascent of fluids in capillary tubes, animal secretion, fluidity, fixity, fermentation, &c.; which fee under their proper names.

"Thus" (adds our incomparable author) "will nature be found conformable to herself, and very simple, performing all the great motions of the heavenly bodies by the attraction of gravity which intercedes those bodies, and almost all the small ones of their parts, by some other attractive power diffused through their particles. Without such principles, there never would have been any motion in the world; and without the continuance thereof, motion would soon perish; there being otherwise a great decrease or diminution thereof which is only supplied by these active principles."

* Optics, p. 573.*

For these reasons it is certainly unjust to declare against a principle which furnishes so beautiful a view, for no other reason but because we cannot conceive how one body should act on another at a distance. It is certain that philosophy allows of no action but what is by immediate contact or impulse (for how can a body exert any active power where it does not exist? to suppofe this of anything, even of the Supreme Being himself, would perhaps imply a contradiction); yet we fee effects without seeing any such impulse; and where there are effects, we can easily infer there are causes, whether we fee them or not. We may consider such effects, therefore, without entering into the consideration of the causes, as indeed it seems the business of a philofopher to do; for to exclude a number of phenomena which we fee, would be to leave a great chain in the history of nature: and to argue about thofe which we do not fee, would be to build castles in the air. Here it follows, that the phenomena of attraction are matter of physical consideration, and as fuch entituled to a place in the fyllem of physics; but that the causes of them will only become so when they become fufible, i.e. when they appear to be the effect of some other higher causes (for a caufe is no otherwife feen than as itfelf is an effect, fo that the firft caufe must, from the nature of things, be invifible); we are, therefore, at liberty to suppusc the caufes of attraction what we please, without any injury to the effects. The illufrious Newton himself feems, indeed, a little irrefolute as to the caufes, inclining sometimes to attribute gravity to the action of an immaterial caufe, Optics, p. 343, &c.; and sometimes to that of a material one, Ibid. p. 352.

In his philofophy, the research into caufes is the laft thing, and never comes under consideration till the laws and phenomena of the effects be settled; it being to these phenomena that the caufe is to be accommodated. The caufe even of any of the greatest and most fufible actions is not adequately known; how impulse or perception itself, for in-stance, produces its effect, that is, how motion is communi-cated by one body to another, confounds the deepphilofophers; yet impulse received not only into philofophy, but into mechanics; and accordingly the laws and phenomena of its effects make the chief part of common mechanics.

The other species of attraction, therefore, in which no impulse is remarkable, when their phenomena are sufficiently ascertained, have the same title to be promoted from physical to mathematical consideration; and this without any previous inquiry into their caufes, which our conceptions may not be proportioned to; let them be occult, as all caufes strictly fpeaking are, so that their effects, which alone immediately concern us, be but apparent. See Caufes.

Our illufrious countryman, therefore, far from adulterating philosophy with any thing foreign or metaphysical, as many have reproach'd him with doing, has the glory of having thrown every thing of this kind out of his fyllem, and of having opened a new fource of the most sublime me-chanics yet known; it is hence, therefore, that we must expect to learn the manner of the changes, productions, generations, corruptions, &c. of natural things; with all that fene of wonders which is open'd to us by the operations of chemistry.

The caufe of attraction was long accounted for, by supposing that there exifted a certain unknown substance which impelled all bodies towards each other; an hypothefis to which philofophers had recourse, from an opinion which had constantly been admitted as a ftrill principle, "that no body can act where it is not;" as if it were more difficult to conceive why a change is produced in a body by another which is placed at a greater distance, than why it is produced by one which is fituated at a fmall distance; it being not only as improbable to explain the phenomena of attraction by impul-fion as it is to conceive how bodies should be urged towards each other by the action of an external fubftance, as how they should be urged towards each other by a power inherent in themselves. The fact is, that we can neither comprehend the one nor the other; nor can any reafon be assigned why the Creafor might not as eafily beftow upon matter the power of acting upon matter at a distance, as the power of being acted upon and changed by matter in actual contact.

But we have no reafon besides for supposing that bodies are ever in any cafe actually in contact. For all bodies are diminished in bulk by cold, that is to fay, their particles are
are brought nearer each other, which would be impossible, unless they had been at some distance before the application of the pull. Almost all bodies are diminished in bulk by precession, and consequently their particles are brought nearer each other; and the diminution of bulk is always proportional to the precession. Newton has also shown that it requires a force of many thousands to bring two gladioli within the eighth part of an inch of each other; that a much greater force is necessary to diminish that distance, and that no precession whatever is capable of diminishing it beyond a certain point. Consequendy there is a force which impede the actual contact of bodies, which increases inversely as some power or function of the distance, and which no power whatever is capable of overcoming. Bosovich has likewise demonstrated, that a body in motion communicates part of its motion to another body before it actually reaches it. Hence we may conclude, that, as far as we know, there is no such thing as actual contact in nature; and that bodies of course always act upon each other at a distance. Even impulsion, therefore, or preface, is an instance of bodies acting on each other without being in contact, and consequently this is no better an explanation of attraction, than the supposition that it is an inherent power. We must therefore be satisfied with considering attraction as an unknown power, by which all bodies are drawn towards each other, and which acts constantly and uniformly in all places and spaces, for always to diminish the distance between them, unless when they are prevented from approaching each other by some force equally powerful. But why it diminishes as the distance increases, it is impossible to say; although the fact is certain, and is almost incompatible with the supposition of impulsion being the cause of attraction. The truth is, that we must not be too precipitate in drawing conclusions, but must wait, with patience, till future discoveries shall enable us to advance farther; satisfying ourselves, in the mean time, in arranging the laws of nature which have been ascertained, without attempting to develop the causes upon which they depend.

Attraction, in Chemistry. See AFFINITY.

Attraction, Centre of. See CENTRE.

Attraction of Mountains. According to the Newtonian theory of attraction, this principle pervades the mionutell particles of matter, and the combined action of all the parts of the earth forms the attraction of the whole. For the same reason, therefore, that a heavy body tends downwards in a perpendicular to the earth's surface, considered as smooth and even, it will be attracted towards the centre of a neighbouring mountain, by a force proportional to the quantity of matter contained in it; and the effect of this attraction, or the accelerative force produced by it, must depend on the nearness or distance of the mountain from the gravitating body, because this force increases as the squares of the distances decrease. Upon these principles it is obvious, that the plumb-line of a quadrant, or of any other astronomical instrument, must be deflected from its proper situation, by a small quantity, towards the mountain, and the apparent altitudes and zenith distances of the stars, taken with the instrument, be altered accordingly: e.g. if the zenith distance of a star on the meridian were observed at two stations under the same meridian, one on the fourth side of a mountain, the other on the north; and the plumb-line of the instrument were attracted out of its vertical position by the mountain, the star must appear too much to the north, by the observation at the southern station, and too much to the south by that at the northern station; and consequently the difference of the latitudes of the two stations resulting from these observations, would be greater than it really is. If then the true difference of their latitudes be determined by measuring the distance between the two stations on the ground, the result of the difference, found by the observations of the star above, that found by this measurement, must have been produced by the attraction of the mountain; and the half of it will be the effect of such attraction on the plumb-line at each observation, provided that the mountain attracts equally on both sides.

The first hint for determining the quantity of this attraction was suggested by Newton, in his Tract of the Seflen of the World; and the first experiment for the purpose was conducted by M. Bouguer, and M. de la Condamine, in the year 1736. Whilst they were employed in measuring three degrees of the meridian, near Quito in Peru, they endeavoured to ascertain the cause of the attraction of Cachapoal, a mountain in that neighbourhood, which, by a rough computation, they supposed to be equal to about the thousandth part of the attraction of the whole earth. By observing the altitudes of fixed stars at two stations, one on the south side of the mountain, and the other on the north, they found the quantity of 77" in favour of the attraction of the mountain by a mean of their observations; whereas the plumb-line, according to the theory, should have declined from the true vertical line 1° 43'. However, though the general result is favourable to the Newtonian doctrine, the experiment was performed under so many disadvantages, as not to afford the satisfaction which was to be wished; and M. Bouguer terminates his account of his observations, with expressing his hopes, that the experiment might be repeated under more favourable circumstances, either in France or in England. Bouguer, Figure de la Terre.

Nothing was afterwards done, till Mr. (now Dr.) Maskelyne, the present astronomer royal, made a proposal to the Royal Society for this purpose, in the year 1773; and in 1774, he was deputed to make the trial, accompanied with proper assistants, and furnished with the most accurate instruments. He made choice of the mountain Schehallien, in Scotland, for the scene of his operations, the direction of which is nearly from east to west, its mean height above the surrounding valley about 2000 feet, and its highest part above the level of the sea 3550 feet. Two stations for observations were selected, one on the north, and the other on the south side of the mountain. Every circumstance that could contribute to the accuracy of the experiment was regarded; and from the observation of ten stars near the zenith, Mr. Maskelyne found the apparent difference of the altitudes of the two stations to be 54". And from a measurement by triangles, formed from two bases on different sides of the mountain, he found the difference of their parallels to be 4364 feet, which, in the latitude of Schehallian, viz. 56° 40', answers to an arch of the meridian of 43", which is less by 11° 6' than that found by the fector. Its half, therefore, or 5° 8" is the mean effect of the attraction of the mountain. From this experiment, conducted with great attention and accuracy, and tending to the establishment of the Newtonian theory, Mr. Maskelyne infers, that the mountain Schehallien exerts a sensible attraction; and, therefore, that every mountain, and every particle of the earth, is endowed with the same property, in proportion to its quantity of matter. The line of the variation of this force, in the inverse ratio of the squares of the distances, is likewise confirmed by it; for if the force of the attraction of the hill had been only to that of the earth as the matter in the hill to that of the earth, and had not been greatly increased by the near approach to its centre, the attraction must have been wholly insensible. He infers also, that the mean density of the earth is at least double of that at the surface; and consequently, that the density of the internal parts of the earth is much greater than that of the nearer place.
the surface; also that the whole quantity of matter in the earth will be at least twice as great as if all were composed of matter of the same density with that at the surface; and therefore that the hypothesis of those naturalists, who suppose the earth to be only a great hollow shell of matter, is groundless. And finally, that the sensible deflections in the plumb-lines of astronomical instruments, by the density of the superficial parts of the earth, must cause apparent inequalities in the manifuration of degrees in the meridian. He candidly acknowledges, however, that a single experiment is not sufficient to ascertain a matter of such importance, and recommends other experiments of a similar kind to be repeated in various places, and attended with different circumstances; since Schuhellen may differ in its internal constitution from other mountains, as there is no appearance of its ever having been a volcano, which is the case of many others. Phil. Trans. vol. liv. part 2. N° 48 and 29.

ATTREBATH, in Ancient Geography. See ATTRBATH.

ATTRIBUTE, from attribus, in a general sense, that which agrees to some person or thing; or a quality which determines something to be after a certain manner. Among logicians, it denotes the predicate of any subject, or whatever may be affirmed or denied concerning it. But more strictly speaking, an attribute is the name with an essential mode, or it is that which belongs to the nature or essence of the subjects in which it is. Thus, understanding is an attribute of mind; figure, an attribute of body, &c.

Of the several attributes belonging to any subsance, that which presents itself first, and which the mind conceives as the foundation of all the rest, is called its essential attribute. Thus, extension is by form, and solidity by others, made the essential attribute of body or matter. The other attributes are called accidental ones, i.e. gr. roundness in wood, or learning in a man. Mr. Locke endeavours to prove, that thinking, which the Cartesian make the essential attribute of the mind, is only an accidental one.

Mr. Harris (Hermes, p. 29.) considering all things whatsoever that exist either as the energies or affections of some other thing, or as not being the energies or affections of something else, refers the former to the denomination of attributes, and the latter to that of subsances. Thus, to think is the attribute of a man; to be white, of a fawn; to fly of an eagle, &c. If they exist not after this manner, then they are called subsances.

Spinoza makes the soul and the body to be of the same subsance, with this only difference, that the soul is to be conceived under the attribute of thought, and the body under that of extension.

ATTRIBUTES, in Theol. g., denote the several qualities and perfections which we conceive in God, and which constitute his proper essence; as justice, goodness, wisdom, &c. The perfections of God are called his attributes, because he cannot be without them. Theological writers have distributed the attributes of the deity into natural, such as knowledge and power; and moral, such as justice and benevolence. Of these writers some have maintained that all the natural attributes are comprehended under power and knowledge; and that benevolence comprehends all those that are denominated moral. Others, alleging that God always does that which is right and fit, have considered all his moral attributes, viz. justice, truth, faithfulness, mercy, patience, &c. as merely different modifications of rectitude. Others, again, have represented wisdom as the spring of all the divine actions. Accordingly, they have flated the moral attributes of God to be only different ways of considering his will, as invariably determined by his wisdom, so that which is best in all possible circumstances. The attributes discriminated by this denomination are good, justice, truth, and fidelity. Goodness is the will of God, determined by his wisdom, to the communciation of being and happiness because it is fit, and as far as it is fit; justice is the will of God, determined by his wisdom, to maintain right and order, and for this purpose to do all that is necessary for convincing his reasonable creatures of the regard he hath for the preservation of his own rights and of theirs; truth, or sincerity, is the will of God, determined by his wisdom, to avoid using all signs in his intercourses with his intelligent creatures, from which they may not only take occasion, without necessity, to deceive themselves, but would have jst ground to charge him with being their deceiver, having a meaning to himself quite different from that which the other thes he made use of naturally supposed, and were intended to signify; faithfulness is the will of God, determined by his wisdom to make good all his promises and engagements; and the holiness of God seems to brand for all these perfections in conjunction; the Deity being separated by them from all society and friendship with false Gods. Accordingly, to this statement it is alleged, that we have clear, distinct, and proper, though not adequate, ideas of the moral attributes of the divine nature; whereas some have maintained, that our notions of justice and goodness do not at all agree to these attributes as they pertain to the Deity, in whom they signify something, of which we have only a confused or rather no apprehension, and very different from what they do when ascribed to men. To this purpose, lord Bolingbroke (Works, vol. iv. and v.) founds his fyllem on this extravagant paradox, as it has been juftly called, that we have no adequate ideas of God's moral attributes, his goodness and justice, as we have of his natural, his wisdom and power; and accordingly he denies justice and goodnes to be the same in God as in man; and he pretends, that the ideas of God's moral attributes cannot be acquired by any reasoning at all, either a priori or a posteriori, and hence concludes, that if a man has such ideas, they were not found but invented by him. See his objections slated and answered by the late Bishop Warburton, in his "View of Lord Bolingbroke's Philosophy," Letter 1. See Hartley's Obs. on Man, p. 316. Bays on Divine Benevolence. Wollaston's Rel. of Nat. p. 116—119. Grove's Wisdom the first Spring of Action in the Deity, in his Works, iv. p. 1—46, &c. Balguy's Divine Rectitude, p. 3—8.

The heathen mythologists divide the deity into as many distinct beings as he has attributes; thus the power of God was called Jupiter; the wrath of God, Juno; the absolute will of God, Fate, or Destiny, to which even his power is subject.

ATTRIBUTES, in Painting and Sculpture, are symbols added to figures and statues, to denote their particular office and character. Thus the club is an attribute of Hercules; the palm is an attribute of victory; the pears, of Juno; the eagle, of Jupiter; the trident, of Neptune; the balance of justice; the olive, of peace, &c. See Painting.

ATTRIBUTIVES, in Grammar, are words which are significant of attributes; and thus include adjectives, verbs, and participles, which are attributes of substantives, and adverbs, which denote the attributes only of attributes. Mr. Harris, who has introduced this distribution of words, denominates the former attributes of the first order, and the latter attributes of the second order. Harris's Hermes.

ATTRITION, formed of attrere, to draw; triturre, or friction, expresses such a motion of bodies against one another, as strikes off the superficial particles, whereby they gradually become lefs and lefs. The grinding and polishing of bodies is performed by attrition. The effects of attrition
ATU

Ation in exciting heat, light, electricity, &c. see under Electricity, Fire, Heat, and Light.

Attrition, among Divin i., denotes a sorrow or regret for having offended God; arising from a sense of the obdurate-ness of sin, and the apprehension of punishment; &c. of the loss of heaven, and the pains of hell.

Attrition is esteemed the lowest degree of repentance, being a steep short of contrition, which supposes the love of God an ingredient or motive of our sorrow and repentance. Attraction, in the church of Rome, was considered as a sufficient distinction for a man in the sacrament of penance to receive absolution, and be justified before God, by removing his guilt, and the obligation to punishment. Hence Dr. Jer. Taylor mentions this notion as one of those which accidentally taught or led to an ill life. Liberty of Prospecting, p. 272.

ATROW, in Botany, a name given by the people of Guinea to a plant which they use in caves of dwelling, bedding the leaves in water, and using the decoction by way of a fomentation.

It is a species of Kali, and called by Petiver Kali Guineense, foliis argyrophyllis, floribus verticillatis in modum dispathitis, from its leaves resembling the common knot-grass, and its flowers growing in bundles round the stalks. Phil. Trans. N. 1. 232.

ATTROMMALIGNOC, a name given by the people of Guinea to a herb which they use in medicine; they boil it in water, and give the decoction in the venerous disea.
The juice of it, when freshly pressed out, is also used, infused up the nostrils, to promote freezing, and cure several disorders of the head and eyes. Phil. Trans. N. 1. 232.

It is a species of COLUTA, called by Petiver, COLUTA Lamiifolia, foliis parvis pilosis pilis dense, februm densibus; and Dr. Herman calls it apergularis.

ATUARI, in Ancient Geography, a people of Germany, called by Strabo Chattuarii, and placed by him in the neighbourhood of Cattes. By Tacitus they are denominated Chattesarii. Julian marched against these people, and after an expedition of three months, defeated them.

ATUAE, in Geography, a town of Arabia, 76 miles W.S.W. of Saada.

ATTUND, or Ostund, a country of Sweden, being one of the three parts of Upland, between Stockhom, Upland, and the Baltic sea; famous for its mines.

ATTURNATO faciendo vel recipiendo, in Law. See ATTORNATO, &c.

ATTU, in Ancient Geography, a town of Asia Minor, on the confines of Bithynia and Mytra, Pityri.

ATUACA, or ATTUACA, a town of Beclue Gaul, mentioned by Caesar as belonging to the Eburones, and called by Anton. (Itin.) Adventus Tongravum. This city, under the appellation of Tongres, was raised by Attilla in 451, and its episcopal see was transferred to Maerderich; and from thence, in 861, to Liege.

ATUED, or ATUET, in Geography, a town of Sweden, in East Gotland, having in its vicinity some good mines; six leagues south-east of Lindköping.

ATUNJAUXA. See JUXA.

ATUN-CANAR, or GREAT CANAR, a village of South America, in the jurisdiction of Guiana, and province of Quito, famous for its fertility and the treasures supposed to be buried in the earth. One of the Indians is said to have built in this place several magnificent temples, splendid palaces, and forts of stone, like those of China, and to have plated the inside of the walls with gold. Some remains of its ancient magnificence are still visible. Juan and Ulloa's Voyage to South America, by Adams, vol. i. p. 319.

ATUL, or ATTUENSIM CITIATA, in Ancient Geography, a town of Gaul, in the district of Novem-populania, seated on the river Atunus; now Aire on the Adour.

ATURES, in Geography, a famous cataract of the river Oromoko, in South America.

ATURI, a town of European Turkey, in Bejfarabia, twenty-two miles south of Bender.

ATURIA, or ATTURIA, in Ancient Geography, a name given by Strabo to Affyrina.

ATWOOD's Key, in Geography, a small island surrounded by rocks, twelve miles north-east from Crooked island, and fifty miles from Yuma, or Long island, one of the Bahamas. N.lat. 23° 38'. W. long. 73°.

ATTYADE, in Ancient Geography, the first race of kings who reigned in Lydia, &c. called from Attys, the son of Cos, and grandson of Meaxes, who is said to be the son of Jupiter and Tellus. The Attiades were succeeded by the Heracleis, or descendants of Hercules. See Lydia.

ATYMNUS, in Antiquology, a species of Papilio (Plat. Rur. Lim.) that inhabits China and Siam. The wings are tailed, fulvous; with the anterior ones black at the apex. Donovan's Inf. China, &c. p. 10. This is Hypsea Arunia of Fab.

ATYPOS, from a negative, and μεκός, form, or tenor, erratic, or irregular, a word used by the old writers in medicine, for such diseases as did not observe any regularity in their periods.

Others have also used the same word in a very different sense, namely, for deformities and irregularities in the limbs; and others, for persons who, from some defects in the organs of speech, cannot articulate certain particular sounds.

ATYS, in Ancient Geography, a river of Sicily, now called the Corbo.

ATY, in Zoology, a species of Stoma, in Audubon's Histoire des Singes. (Fam. 4. fecl. 2. fig. 2.) It belongs to the family of Cynocon, and measures one foot five inches from the muzzle to the tail. The whole body is of a dirty whitish colour; the feet, hands, face, and ears are of a flesh colour; the muzzle is long; tail moderate; ears nearly round. This is represented as a mischievous and choleric animal; and capable of biting with great violence. It is conjectured to be the great white East Indian Apes figured by Albert Seba in his Thesaurus Rer. Natur. t. 1. pl. 48. fig. 5. by some modern French naturalists; and also the Cerphilias femen of Erxleben. Syll. Reg. Anim. p. 24.

ATZEL, ORIOLES Nobilis, in Ornithology, the name given by Merrem Begtr. to the bird called by Latham the long-billed Grackle; Gracoulus longirostris of Pallas and Gmelin. Merrem also calls it Ociula lorysophus of Gmelin, Goldzhiliger gelbchulderich Atzel.

ATZMANS DORF, in Geography, a town of Germany, in the circle of the Lower Rhine, four miles south-east of Erfurt.

AU, a town of Germany, in the arch-duchy of Austria, six miles north of Gemunden.—Also, a town in Lower Bavaria, twelve miles north-west of Hofburg.

AVA, a kingdom of Asia, in the peninsula of India beyond the Ganges; for an account of which see Birmian Empire.

AVA, or AVANGAN, the capital city of the kingdom of the same name, or of the whole of the Birmian empire, situate in N. lat. 23° 5', E. long. 97° 54'. It is divided into an upper and lower city, both of which are fortified; the lower is the most extensive, and is supposed to be about four miles in circumference; it is protected by a wall thirty feet high, with a deep and broad fosse. The communication between the fort and the country is over a mound of earth, crossing a ditch that supports a causetway; the upper or smaller fort, which may be called the citadel, and does not exceed Q 2 a mile
